L

a letter which was the twelfth letter of the Phoenician alphabet. It has in its history passed through many changes of form, ending curiously enough in its usual manuscript form with a shape almost identical with that which it had about 900 B.C. (L). As was the case with B and some other letters the Greeks did not everywhere keep the symbol in the position in which they had borrowed it. This, which was its oldest form in Attica and in the Chalcidian colonies of Italy, was the form adopted by the Romans, who in time converted it into the rectangle L, which passed from them to the nations of western Europe. In the Ionic alphabet, however, from which the ordinary Greek alphabet is derived it appeared as Λ. A still more common form in other parts of Greece was Λ, with the legs of unequal length. The editors of Herodotus have not always recognized that the name of Labda, the mother of Cypselus, in the story (v. 92) of the founding of the great family of Corinthian despoties, was derived from the fact that she was lame and so suggested the form of the Corinthian Λ. Another form Π or Π was practically confined to the west of Argolis. The name of the Greek letter is ordinarily given as Lambda, but in Herodotus (above) and in Athenaeus x. p. 453 e, where the names of the letters are given, the best authenticated form is Labda. The Hebrew name, which was probably identical with the Phoenician, is Lamed, which, with a final vowel added as usual, would easily become Lambda, λ being inserted between μ and another consonant. The pronunciation of l varies a great deal according to the point at which the tongue makes contact with the roof of the mouth. The contact, generally speaking, is at the same point as for d, and this accounts for an interchange between these sounds which occurs in various languages, e.g. in Latin lacrima from the same root as the Greek δάκρυον and the English tear. The change in Latin occurs in a very limited number of cases and one explanation of their occurrence is that they are borrowed (Sabine) words. In pronunciation the breath may be allowed to escape at one or both sides of the tongue. In most languages l is a fairly stable sound. Orientals, however, have much difficulty in distinguishing between l and r. In Old Persian l is found in only two foreign words, and in Sanskrit different dialects employ r and l differently in the same words. Otherwise, however, the interchanges between r and l were somewhat exaggerated by the older philologists. Before other consonants l becomes silent in not a few languages, notably in French, where it is replaced by n, and in English where it has occasionally been restored in recent times, e.g. in fault which earlier was spelt without l (as in French whence it was borrowed), and which Goldsmith could still rhyme with sought. In the 19th century the Scottish dialect of English dropped l largely both before consonants and finally after a and å, a' = all, fa' = fall, pu' = pull, 'oo' = wool, bulk pronounced like book, &c., while after o it appears as w, row (pronounced ra) = roll, know = knoll, &c. It is to be observed that L = 50 does not come from this symbol, but was an adaptation of Λ, the western Greek form of Χ, which had no corresponding sound in Latin and was therefore not included in the ordinary alphabet. This symbol was first rounded into Σ and then changed first to L and ultimately to L.

LAACHER SEE, a lake of Germany, in the Prussian Rhine Province, 5 m. W. of Brohl on the Rhine, and N. of the village of Niedermending. It occupies what is supposed to be a crater of the Eifel volcanic formation, and the pumice stone and basalt found in great quantities around it lend credence to this theory. It lies 850 ft. above the sea, is 5 m. in circumference and 160 ft. deep, and is surrounded by an amphitheatre of high hills. The water is sky blue in colour, very cold and bitter to the taste. The lake has no natural outlet and consequently is subjected to a considerable rise and fall. On the western side lies the Benedictine abbey of St Maria Laach (Abbatia Laciensis) founded in 1073 by Henry II., count palatine of the Rhine. The abbey church, dating from the 12th century, was restored in 1858. The history of the monastery down to modern times appears to have been uneventful. In 1812 it was abandoned and at the close of the Napoleonic wars it became a Prussian state demesne. In 1863 it passed into the hands of the Jesuits, who, down to their expulsion in 1873, published here a periodical, which still appears, entitled Stimmen aus Maria Laach. In 1892 the monastery was again occupied by the Benedictines.

LAAGER, a South African Dutch word (Dutch leger, Ger. lager, connected with Eng. "lair") for a temporary defensive encampment, formed by a circle of wagons. The English word is "leaguer," an armed camp, especially that of a besieging or "beleaguering" army. The Ger. lager, in the sense of "store," is familiar as the name of a light beer (see Brewing).

LAAS, ERNST (1837-1885), German philosopher, was born on the 16th of June 1837 at Fürstenwalde. He studied theology and philosophy under Trendelenburg at Berlin, and eventually became professor of philosophy in the new university of Strassburg. In Kant's Analogien der Erfahrung (1876) he keenly criticized Kant's transcendentalism, and in his chief work Idealismus und Positivismus (3 vols., 1879-1884), he drew a
Heinrich Albrecht the de grace, he became accepted ecclesiastical is 1693), was head of theuncianns with a posthumous collection, which was published at Vienna (1887). See Hansich, Der Positivismus von Ernst Laas (1902); Gjurits, Die Erkenntnistheorie des Ernst Laas (1903); Falckenberg, *Hist. of Mod. Philos.* (Eng. trans., 1895).

**LA BADIE, JEAN DE** (1610–1674), French divine, founder of the school known as the Labadists, was born at Bourg, not far from Bordeaux, on the 15th of February 1610, being the son of Jean Charles de la Badie, governor of Guienne. He was sent to the Jesuit school at Bordeaux, and when fifteen entered the Jesuit college there. In 1626 he began to study philosophy and theology. He was led to hold somewhat extreme views about the efficacy of prayer and the direct influence of the Holy Spirit upon believers, and adopted Augustinian views about grace, free will and predestination, which brought him into collision with his order. He therefore separated from the Jesuits, and then became a preacher to the people, carrying on this work in Bordeaux, Paris and Amiens. At Amiens he was a pastor and held the chair of theology. The hostility of Cardinal Mazarin, however, forced him to retire to the Carmelite hermitage at Gravelle. A study of Calvin's *Institutes* showed him that he had more in common with the Reformed than with the Roman Catholic Church, and after various adventures he joined the Reformed Church of France and became professor of theology at Montauban in 1650. His reasons for doing so he published in the same year in his *Déclaration de Jean de la Badie*. His accession to the ranks of the Protestants was deemed a great triumph; no such man since Calvin himself, it was said, had left the Roman Catholic Church. He was called to the pastorate of the church at Orange on the Rhone in 1657, and at once became noted for his severity of discipline. He set his face zealously against dancing, card-playing and worldly entertainments. The unsettled state of the country, recently annexed to France, converted his parish of Orange into a strong fortress, and he was appointed a general in Germany. He then accepted a call to the French church in London, but after various wanderings settled at Middleton, where he was pastor to the French-speaking congregation at a Wallach church. His peculiar opinions were by this time (1666) well known, and he and his congregation found themselves in conflict with the ecclesiastical authorities. The result was that la Badie and his followers established a separate church in a neighbouring town. In 1669 he moved to Amsterdam. He had enthusiastic disciples, Pierre Yvon (1646–1707) at Montauban, Pierre Dulignon (d. 1675), François Menuret (d. 1670), Theodor Untereky (d. 1693), F. Spanheim (1632–1701), and, more important than any, Anna Maria v. Schürmann (1607–1678), whose book *Eucletia* is perhaps the best exposition of the tenets of his master. At the head of his separatist congregation, la Badie developed his views for a reformation of the Reformed Churches: the church is a apostolic in origin; baptism is the sign and seal of this regeneration; and is to be administered only to believers; the Holy Spirit guides the regenerate into all truth, and the church possesses throughout all time those gifts of prophecy which it had in the ancient days; the community at Jerusalem is the continual type of every Christian congregation, therefore there should be a community of goods, the disciples should live together, eat together, dance together; marriage is a holy ordinance between two believers, and the children of the regenerate are born without original sin, marriage with an unregenerate person is not binding. They did not observe the Sabbath, because—so they said—their life was a continual Sabbath. The life and separatism of the community brought them into frequent collision with their neighbours and with the magistrates, and in 1670 they accepted the invitation of the princess Elizabeth, abbess of Herford in Westphalia, to take up their abode within her territories, and settled in Herford to the number of about fifty. Not finding the rest they expected they migrated to Bremen in 1672, and afterwards to Altona, where they were dispersed on the death of the leaders. Small communities also existed in the Rhineland, and a missionary settlement was established in New York. Jean de la Badie died in February 1674.

**LABARUM**, the sacred military standard of the early Christian Roman emperors, first adopted by Constantine the Great after his miraculous vision in 312, although, according to Gibbon, he did not exhibit it to the army till 323. The name seems to have been known before, and the banner was simply a Christianized form of the Roman cavalry standard. Eusébius (*Life of Const.* i. 31) describes the first labarum as consisting of a long gilded spear, crossed at the top by a bar from which hung a square purple cloth, richly jewelled. At the upper extremity of the spear was a golden wreath encircling the sacred monogram, formed of the first two letters of the name of Christ. In later banners the monogram was sometimes embroidered on the cloth. A special guard of fifty soldiers was appointed to protect the sacred standard. The derivation of the word labarum is disputed; it appears to be connected with the Basque *labarro*, signifying standard. See *Flag*.

**LABÉ, LOUISE CHARLIN PERRIN** (c. 1525–1569), French poet, called *La Belle Cordière*, was born at Lyons about 1525, the daughter of a rich rope-maker, named Charley or Charlin. At the siege of Perpignan she is said to have fought on horseback with the soldiers of the Dauphin, afterwards Henry II. Some time before 1531 she married Ennemond Perrin, a rope-maker. She formed a library and gathered round her a society which included many of the learned ladies of Lyons,—Perdette du Guillet, Claudine and Sibylle Scève and Clémence de Bourges, and the poets Maurice Scève, Charles Fontaine, Pontus de Tyard; and among the occasional visitors were Clément Marot and his friend Melin de Saint-Gelais, with probably Bonaventure des Périers and Rabelais. About 1538 the poet Olivier de Magny passed through Lyons on his way to Italy in the suite of Jean d'Avanson, the French envoy to the Holy See. As the friend of Ronsard, "Prince of Poets," he met with an enthusiastic reception from Louise, who straightway fell in love with him. There seems little doubt that her passion for Magny inspired her eager, sincere verse, and the elegies probably express her grief at his first absence. A second short visit to Lyons was followed by a second longer absence. Magny's influence is shown more clearly in her sonnets, which, printed about 1535, quickly attained great popularity. During his second visit to Italy Magny had apparently consoled himself, and Louise, despairing of his return, encouraged another admirer, Claude Ruby, when her lover returned unexpectedly. Louise dismissed Rubys, but Magny's jealousy found vent in an ode addressed to the Sire Aymon (Ennemond), which ruined her reputation; while Rubys, angry at his dismissal, avenged himself later in his *Histoire véritable de Lyons* (1573). This scandal brought a fatal blow to Louise's position. Shortly afterwards her husband died, and she returned to her country house at Parbec, where she died on the 25th of April 1568, leaving the greater part of the fortune she was left to the poor. Her works include, besides the *Elegies* and *Sonnets* mentioned, a prose *Débat de folie et d'amour* (translated into English by Robert Greene in 1608).

See editions of her *Oeuvres* by P. Blanchemain (1875), and C. Boy (2 vols., 1887). A sketch of Louise Labé and of the Lyonnaise
Society is in Miss Edith Sichel's Women and Men of the French Renaissance (1901). See also J. Favre, Olivier de Magny (1885).

LABEL (a French word, now represented by lambae, possibly a variant; it is of obscure origin and may be connected with a Teutonic word appearing in the English "lap," a flap or fold), a slip, ticket, or card of paper, metal or other material, attached to an object, such as a parcel, bottle, &c., and containing a name, address, description or other information, for the purpose of identification. Originally the word meant a band or ribbon of linen or other material, and was thus applied to the fillets (infusae) attached to a bishop's mitre. In heraldry the "label" is a mark of "cadency."

In architecture the term "label" is applied to the outer projecting moulding over doors, windows, arches, &c., sometimes called "Dripstone" or "Weather Moulding" or "Hood Mould." The former terms seem scarcely applicable, as this moulding is often inside a building where no rain could come, and consequently there is no drip. In Norman times the label frequently did not project, and when it did it was very little, and formed part of the series of arch mouldings. In the Early English styles they were not very large, sometimes slightly undercut, sometimes deep, sometimes a quarter round with chamfer, and very frequently a "roll" or "scroll-moulding," so called because it resembles the part of a scroll where the edge laps over the body of the roll. Labels generally resemble the string-courses of the period, and, in fact, often return horizontally and form strings. They are less common in Continental architecture than in English.

LABEON, MARCUS ANTIUSTUS (c. 50 B.C.-A.D. 18), Roman jurist, was the son of Paucuvius Antius Labeo, a jurist who caused himself to be slain after the defeat of his party at Philippi. A member of the plebeian nobility, and in every circumstance, the younger Labeo early entered public life, and soon rose to the praetorship; but his undisguised antipathy to the new regime, and the somewhat brusque manner in which he occasionally gave expression to his republican sympathies—what Tacitus (Ann. iii. 75) calls his incorrupta libertas—proved an obstacle to his advancement, and his rival, Atelius Capito, who had unreservedly given in his adherence to the ruling powers, was promoted by Augustus to the consulate, when the appointment should have fallen to Labeo; smarting under the wrong done him, Labeo declined the office when it was offered to him in a subsequent year (Tac. Ann. iii. 75; Pompon, in fr. 47, Dig. i. 2). From this time he seems to have devoted his whole time to jurisprudence. His training in the science had been derived principally from Trebatius Testa. To his knowledge of the law he added a wide general culture, devoting his attention specially to dialectics, philology (grammatica), and antiquities, as valuable aids in the exposition, expansion, and application of legal doctrine (Gell. xiii. 10).

Down to the time of Hadrian his was probably the name of greatest authority; and several of his works were abridged and annotated by later hands. While Capito is hardly ever referred to, the dicta of Labeo are of constant recurrence in the writings of the classical jurists, such as Gaius, Ulpian and Paul; and no inconsiderable number of them were thought worthy of preservation in Justinian's Digest. Labeo gets the credit of being the founder of the Proculian sect or school, while Capito is spoken of as the founder of the rival Sabinian one (Pomponius in fr. 47, Dig. i. 2); but it is probable that the real founders of the two scholes were Proculus and Sabinus, followers respectively of the methods of Labeo and Capito.

Labeo's most important literary work was the Libri Posteriorum, so called because published only after his death. It consisted of a systematic exposition of the common law. His Liber ad Estatem embraced a commentary, not only on the edicts of the urban and peregrine praetors, but also on that of the curule aediles. His Probabilium (probabilic) lib. VIII., a collection of definitions and axiomatic propositions, seems to have been one of his most characteristic productions.

See van Eck, "De vita, moribus, et studiis M. Ant. Labonis" (Franeker, 1879), in Oedrichis's Thea. nov., vol. i.; Mascoenius, De sectis Sabiniano et Proculiano (1728); Pernice, M. Antiustus Labeo. Das rom. Privatrecht im ersten Jahrhunderte der Kaiserzeit (Halle, 1832-1892).

LABERIUS, DECIMUS (c. 105-43 B.C.), Roman knight and writer of imes. He seems to have been a man of caustic wit, who wrote for his own pleasure. In 45 Julius Caesar ordered him to appear in one of his own imes in a public contest with the actor Publius Syrus. Laberius pronounced a dignified prologue on the degradation thus thrust on his sixty years, and directed several sharp allusions against the dictator. Caesar awarded the victory to Publius, but restored Laberius to his equestrian rank, which he had forfeited by appearing as a minutus (Macrobius, Sat. ii. 7). Laberius was the chief of those who introduced the minius into Latin literature towards the close of the republican period. He seems to have been a man of learning and culture, but his pieces did not escape the coarseness inherent to the class of literature to which they belonged; and Aulus Gellius (xvi. 7, 1) accuses him of extravagance in the coinage of new words. Horace (Sat. i. 10) speaks of him in terms of qualified praise.

In addition to the prologue (in Macrobius), the titles of forty-four of his mimes have been preserved; the fragments have been collected by O. Ribbeck in his Comiciurn Latinorum reliqiusae (1873).

LABIATAEA (i.e. "lipped," Lat. labium, lip), in botany, a natural order of seed-plants belonging to the series Tubiflorae of the dicotyledons, and containing about 150 genera with 2800 species. The majority are annual or perennial herbs inhabiting the temperate zone, becoming shrubby in warmer climates. The stem is generally square in section and the simple exstipulate leaves are arranged in decussating pairs (i.e. each pair is in a plane at right angles to that of the pairs immediately above and below it); the blade is entire, or toothed, lobed or more or less deeply cut. The plant is often hairy, and the hairs are frequently glandular, the secretion containing a scent characteristic of the genus or species. The flowers are borne in the axils of the leaves or bracts; they are rarely solitary as in Scutellaria (skull-cap), and generally form an apparent whorl (verticillaster) at the node, consisting of a pair of cymes of inflorescences each of which is a simple three-flowered dichasium as in Brunella, Salvia, &c., or more generally a dichasium passing over into a pair of monochasial cymes as in Lamium (fig. 1), Bailotia, Nepeta, &c. A number of whorls may be crowded at the apex of the stem and the subtending leaves reduced to small bracts, the whole forming a raceme- or spike-like inflorescence as in Mentha (fig. 2, 5) Brunella, &c.; the bracts are sometimes large and coloured as in Monarda, species of Salvia, &c., in the latter the apex of the stem is sometimes occupied with a cluster of sterile coloured bracts. The plan of the flower is remarkably uniform (fig. 1, 8); it is bisexual, and zygomorphic in the
LABICANA, VIA—LABICHE

median plane, with 5 sepals united to form a persistent cup-like calyx; 5 petals united to form a two-lipped gaping corolla, 4 stamens inserted on the corolla-tube, two of which, generally the anterior pair, are longer than the other two (didynamous arrangement)—sometimes as in Salvia, the posterior pair is aborted—and two superior median carpels, each very early divided by a constriction in the vertical plane, the pistil consisting of four cells each containing one erect anatropous ovule attached to the base of an axial placenta; the style springs from the centre of the pistil between the four segments (gyynobasic), and is simple with a bifid apex. The fruit comprises four one-seeded nutlets included in the persistent calyx; the seed has a thin testa and the embryo almost or completely fills it. Although the general form and plan of arrangement of the flower is very uniform, there are wide variations in detail. Thus the calyx may be tubular, bell-shaped, or almost spherical, or straight or bent, and the length and form of the teeth or lobes varies also; it may be equally toothed as in mint (Mentha fig. 2, 3), and marjoram (Origanum), or two-lipped as in thyme (Thymus), Lamium (fig. 1) and Salvia (fig. 2, 1); the number of nerves affords useful characters for distinction of genera, there are normally five main nerves between which simple or forked secondary nerves are more or less developed. The shape

Fig. 2.—1, Flower of Sage (Salvia officinalis). 2, Corolla of same cut open showing the two stamens; 3, flower of spear mint (Mentha viridis); 4, corolla of same cut open showing stamens; 5, flowering shoot of same, reduced; 6, floral diagram of Salvia.

of the corolla varies widely, the differences being doubtless intimately associated with the pollination of the flowers by insect-agency. The tube is straight or variously bent and often widens towards the mouth. Occasionally the limb is equally five-toothed, or forms, as in Mentha (fig. 2, 3, 4) an almost regular four-toothed corolla by union of the two posterior teeth. Usually it is two-lipped, the upper lip being formed by the two posterior, the lower lip by the three anterior petals (see fig. 1, and fig. 2, 1, 6); the median lobe of the lower lip is generally most developed and forms a resting-place for the bee or other insect when probing the flower for honey, the upper lip shows great variety in form, often, as in Lamium (fig. 1), Stockys, &c., it is arched forming a protection from rain for the stamens, or it may be flat or as in thyme. In the tribe Ocmidoideae the four upper petals form the upper lip, and the single anterior one the lower lip, and in Teucrium the upper lip is absent, all five lobes being pushed forward to form the lower. The posterior stamen is sometimes present as a staminode, but generally suppressed; the upper pair are often reduced to staminodes or more or less completely suppressed as in Salvia (fig. 1, 2, 6); rarely are they developed and the anterior pair reduced. In Coleus the stamens are monadelphous. In Nepeta and allied genera the posterior pair are the longer, but this is rare, the didynamous character being generally the result of the anterior pair being the longer. The anthers are two-celled, each cell splitting lengthwise; the connective may be more or less developed between the cells; an extreme case is seen in Salvia (fig. 2, 2), where the connective is filiform and jointed to the filament, while the anterior anther-cell is reduced to a sterile appendage. Honey is secreted by a hypogynous disk. In the more general type of flower the anthers and stigmas are protected by the arching upper lip as in dead-nettle (fig. 1) and many other British genera; the lower lip affords a resting-place for the insect which in probing the flower for the honey, secreted on the lower side of the disk, collects pollen on its back. Numerous variations in detail are found in the different genera; in Salvia (fig. 2), for instance, there is a lever mechanism, the barren half of each anther forming a knob at the end of a short arm which when touched by the head of an insect causes the anther at the end of the longer arm to descend on the insect’s back. In the less common type, where the anterior part of the flower is more developed, as in the Ocmidoideae, the stamens and style lie on the under lip and honey is secreted on the upper side of the hypogynous disk; the insect in probing the flower gets smeared with pollen on its belly and legs. Both types include brightly-coloured flowers with longer tubes adapted to the visits of butterflies and moths, as species of Salvia, Stockys, Monarda, &c.; some South American species of Salvia are pollinated by humming-birds. In Mentha (fig. 2, 3), thyme, marjoram (Origanum), and allied genera, the flowers are nearly regular and the stamens spread beyond the corolla.

The persistent calyx encloses the ripe nutlets, and aids in their distribution in various ways, by means of winged spiny or hairy lobes or teeth; sometimes it forms a swollen bladder. A scanty endosperm is sometimes present in the seed; the embryo is generally parallel to the fruit axis with a short inferior radicle and generally flat cotyledons.

The order occurs in all warm and temperate regions; its chief centre is the Mediterranean region, where some genera such as Lavandula, Thymus, Rosmarinus and others form an important feature in the vegetation. The tribe Ocmidoideae is exclusively tropical and subtropical and occurs in both hemispheres. The order is well represented in Britain by several native genera such as Salvia (mit) including also M. piperita (peppermint) and M. Pulegium (pennyroyal); Origanum vulgare (marigoram); Thymus Serpyllum (thyme); Calamintha (calamint), including also C. Cinopodium (wild basil) and C. Acanthus (bush thyme); Salvia (sage) including S. Verbenaca (clary); Nepeta Calaria (catmint), N. Glechoma (ground-ivy); Brunella (self-heal); Scutellaria (skull-cap); Stackys (woundwort); S. Betonica is wood betony; Galeopipis (hemp-nettle); Lamium (dead-nettle); Betula (black alder); and Teucrium (germander); and Ajuga (bugle).

Labiateae are readily distinguished from all other orders of the series excepting Verbenaeaeae, in which, however, the style is excentric), but several genera, e.g. Ajuga, Teucrium, Rosmarinus, approach Verbenaeaeae, in this respect, and in some genera of that order the style is more or less sunk between the ovary lobes. The fruit-character indicates an affinity with Boraginaceae from which, however, they differ in habit and by characters of ovule and embryo.

The presence of volatile oil renders many genera of economic use, such are thyme, marjoram (Origanum), sage (Salvia), lavender (Lavandula); rosemary (Rosmarinus), patchouli (Pogostemon). The tubers of Stachys Sieboldi are eaten in France.

LABICANA, VIA, an ancient highroad of Italy, leading E.S.E. from Rome. It seems possible that the road at first led to Tusculum; but it was then prolonged to Labicia, and later still became a road for trade, as it preceded the Via Latina as a route to the S.E., for, while the distance from Rome to their main junction at Ad Bivium (or to another junction at Comptum Anagninum) is practically identical, the summit level of the former is 725 ft. lower than that of the latter, a little to the west of the pass of Algidus. After their junction it is probable that the road bore the name Via Latina rather than Via Labicana. The course of the road after the first six miles from Rome is not identical with that of any modern road, but can be clearly traced by remains of pavement and buildings along its course.

See T. Ashby in Papers of the British School at Rome, i. 215 (1894).

LABICHE, Eugène Marin (1815—1888), French dramatist, was born on the 5th of May 1815, of bourgeois parentage. He read for the bar, but literature had more powerful attractions, and he was hardly twenty when he gave to the Chérubin—an impertinent little magazine, long vanished and forgotten—a
short story, entitled, in the cavalier style of the period, Les plus belles sont les plus fausses. A few others followed much in the same strain, but failed to catch the attention of the public. He tried his hand at dramatic criticism in the Revue des théâtres, and in 1858 made a double venture on the stage. The small Théâtre du Panthéon produced, amid some signs of popular favour, a drama of his, L’Avocat Loubet, while a vaudeville, Monsieur de Coislin ou l’homme infiniment poli, written in collaboration with Marc Michel, and given at the Palais Royal, introduced for the first time to the Parisians a provincial actor who was to become and to remain a great favourite with them, Grassot, the famous low comedian. In the same year Labiche, still doubtful about his true vocation, published a romance called La Clé des champs. M. Léon Halévy, his successor at the Academy and his panegyrist, informs us that the publisher became a bankrupt soon after the novel was out. “A lucky misadventure,” for,” the biographer concludes, “this timely warning of Destiny sent him back to the stage, where a career of success was awaiting him. There was yet another obstacle in the way. When he married, he solemnly promised his wife’s parents that he would renounce a profession then considered incompatible with moral regularity and domestic happiness. But a year afterwards his wife spontaneously released him from his vow, and Labiche recalled the incident when he dedicated the first edition of his complete works: “To my wife.” Labiche, in conjunction with Varin,1 Marc Michel,2 Clairville,3 Dumanoir,4 and others contributed comic plays interspersed with couples to various Paris theatres. The series culminated in the memorable farce in five acts, Un Chapeau de paille d’Italie (August 1851). It remains an accomplished specimen of the French imbroglio, in which some one is in search of something, but does not find it till five minutes before the curtain falls. Prior to that date Labiche had been only a successful vaudevilleur among a crowd of others; but a twelvemonth later he made a new debut on the Boards of Europe. For the next twenty-five years, although constructed on the old plan, contained a more or less appreciable dose of that comic observation and good sense which gradually raised the French farce almost to the level of the comedy of character and manners. “Of all the subjects,” he said, “which offered themselves to me, I have selected the bourgeois. Essentially mediocre in his vices and in his virtues, he stands half-way between the hero and the scoundrel, between the saint and the profligate.” During the second period of his career Labiche had the collaboration of Delacour,5 Choler,6 and others. When it is asked what share in the authorship and success of the plays may be claimed for those men, we shall answer in Émile Augier’s words: “The distinctive qualities which secured a lasting vogue for the plays of Labiche are to be found in all the comedies written by him with different collaborators, and are conspicuously absent from those which they wrote without him.” A more useful and more important collaborator he found in Jean Marie Michel Geoffroy (1813–1883) whom he had known as a débutant in his younger days, and who remained his faithful interpreter to the last. Geoffroy impersonated the bourgeois not only to the public, but to the author himself; and it may be assumed that Labiche, when writing, could see and hear Geoffroy acting the character and uttering, in his pompous, fussy way, the words that he had just committed to paper. Célimar le bien-aimé (1863), Le Voyage de M. Perrichon (1860), La Grammaire, Un Fide dans le crime, La Cagnotte (1864), may be quoted as the happiest productions of Labiche.

In 1877 he brought his connexion with the stage to a close, and retired to his rural property in Sologne. There he could be seen, dressed as a farmer, with low-brimmed hat, thick gaiters and an enormous stick, superintending the agricultural work and busily engaged in reclaiming land and marshes. His lifelong friend, Augier, visited him in his principality, and, being left alone in the library, took to reading his host’s dramatic productions, scattered here and there in the shape of theatrical brochures. He strongly advised Labiche to publish a collected and revised edition of his works. The suggestion, first declined as a joke and long resisted, was finally accepted and carried into effect. Labiche’s comic plays, in ten volumes, were issued during 1878 and 1879. The success was even greater than had been expected by the author’s most sanguine friends. It had been commonly believed that these plays owed their popularity in great measure to the favourite actors who had appeared in them; but it was now discovered that all, with the exception of Geoffroy, had introduced into them a grotesque and caricatural element, thus hiding from the spectator, in many cases, the true comic vein and delightful delineation of human character. The amazement turned into admiration, and the encouragement became so general that very few dared grumble or appear scandalized when, in 1880, Labiche was elected to the French Academy. It was fortunate that, in former years, he had never dreamt of attaining this high distinction; for, as M. Pailleron justly observed, while trying to get rid of the little faults which were in him, he would have been in danger of losing some of his sterling qualities. But when the honour was bestowed upon him, he enjoyed it with his usual good sense and quiet modesty. He died in Paris on the 23rd of January 1888.

Some foolish admirers have placed him on a level with Mollière, but it will be enough to say that he was something better than a public amuseur. Many of his plays have been transferred to the English stage. They are, on the whole, as sound as they are entertaining. Love is practically absent from his theatre. In none of his plays did he ever venture into the depths of feminine psychology, and womankind is only represented in them by pretentious old maids and silly, insipid, almost dumb, young ladies. He ridiculed marriage according to the invariable custom of French playwrights, but in a friendly and good-natured manner which always left a door open to repentance and timely amendment. He is never coarse, never suggestive. After he died the French farce, which he had raised to something akin to literature, relapsed into its former grossness and unmeaning complexity.

A. Fl.

His Théâtre complet (10 vols., 1879–1879) contains a preface by Ed. Pailleron.

LABICI, an ancient city of Latium, the modern Monte Compatri, about 17 m. S.E. from Rome, on the northern slopes of the Alban Hills, 1739 ft. above sea-level. It occurs among the thirty cities of the Latin League, and it is said to have joined the Aequi in 419 B.C. and to have been captured by the Romans in 418. After this it does not appear in history, and in the time of Cicero and Strabo was almost entirely deserted if not destroyed. Traces of its ancient walls have been noticed. Its place was taken by the respublica Laticanorum Quintiannum, the post-station established in the lower ground on the Via Labicana (see Labinca, Via), a little S.W. of the modern village of Colonna, the site of which is attested by various inscriptions and by the course of the road itself.

See T. Ashby in Papers of the British School at Rome, i. 256 seqq.

T. A. (NS.)

LABID (Abû ‘Aqil Labîd ibn Râbi’a, (c. 560–c. 661), Arabian poet, belonged to the Bani ‘Amir, a division of the tribe of the Hawāzîn. In his younger years he was an active warrior and his verse is largely concerned with inter-tribal disputes. Later, he was sent by a sick uncle to get a remedy from Mahomet at Medina and on this occasion was much influenced by a part of the Koran. He accepted Islam soon after, but seems then to have disdained writing poetry, but he is said to have settled in Kufa. Tradition ascribes to him a long life, but dates given are uncertain and contradictory. One of his poems is contained in the Mo‘allakat (q.v.).

Twenty of his poems were edited by Chalidi (Vienna, 1880); another thirty-five, with fragments and a German translation of the
whole, were edited (partly from the remains of A. Huber) by C. Brockelmann (Leiden, 1892); cf. A. von Kremer, Über die Gedichte des Leydi (Vienna, 1881). Stories of Labid are contained in the Kitâbul-Asbâgh, xiv, 93 ff. and xv, 137 ff.

(W. G. T.)

LABIENUS, the name of a Roman family, said (without authority) to belong to the gens Atia. The most important member was TRITUS LABIENUS. In 63 B.C., at Caesar's instigation, he prosecuted Gaius Rabirius (q.v.) for treason; in the same year, as tribune of the plebs, he carried a plebiscite which indirectly secured for Caesar the dignity of pontefix maximus ( Dio Cassius xxxvii. 37). He served as a legatus throughout Caesar's Gallic campaigns and took Caesar's place whenever he went to Rome. His chief exploits in Gaul were the defeat of the Treviri under Indutiusaurus in 54, his expedition against Lutetia (Paris) in 52, and his victory over Camulogenus and the Aeduvi in the same year. On the outbreak of the civil war, however, he was one of the first to desert Caesar, probably owing to an overweening sense of his own importance, not adequately recognized by Caesar. He was rapturously welcomed on the Pompeian side; but he brought no great strength with him, and his ill fortune under Pompey was as marked as his success had been under Caesar. From the defeat at Pharsalus, to which he had contributed by offering to despoil his late comrades, he fled to Corcyra, and thence to Africa. There he was able by mere force of numbers to inflict a slight check upon Caesar at Ruspina in 46. After the defeat at Thapsus he joined the younger Pompey in Spain, and was killed at Munda (March 17th, 45).

LABLACHE, LUIGI (1794-1858), Franco-Italian singer, was born at Naples on the 6th of December 1794, the son of a merchant of Marseilles who had married an Irish lady. In 1806 he entered the Conservatorio della Pietà de Turchini, where he studied music under Gentili and singing under Valesi, besides learning to play the violin and violoncello. As a boy he had a beautiful alto voice, and by the age of twenty he had developed a magnificent bass with a compass of two octaves from E♭ below to E♭ above the bass staff. After making his first appearance at Naples he went to Milan in 1817, and subsequently travelled to Turin, Venice and Vienna. His first appearances in London and Paris in 1830 led to annual engagements in both the English and French capitals. His reception at St Petersburg a few years later was no less enthusiastic. In England he took part in many provincial musical festivals, and was engaged by Queen Victoria to teach her singing. On the operatic stage he was equally successful in comic or tragic parts, and with his wonderfully powerful voice he could express either humour or pathos. Among his friends were Rossini, Bellini, Donizetti and Mercadante. He was one of the thirty-two torch-bearers chosen to surround the coffin at Beethoven's funeral in 1827. He died at Naples on the 23rd of January 1858 and was buried at Maison Lafitte, Paris. Lablache's Leporello in Don Giovanni was perhaps his most famous impersonation; among his principal other rôles were Dandini in Cenerentola (Rossini), Assur in Semiramide (Rossini), Geronimo in La Gazza Ladra (Rossini), Henry VIII in Anna Bolena (Donizetti), the Doge in Marino Faliero (Donizetti), the title-rôle in Don Pasquale (Donizetti), Geronimo in Il Matrimonio Segreto (Cimarosa), Gritsenko in L'Étoile du Nord (Meyerbeer), Caliban in The Tempest (Halevy).

LABOUR DAY, in the United States, a legal holiday in nearly all of the states and Territories, where the first Monday in September is observed by parades and meetings of labour organizations. In 1882 the Knights of Labor paraded in New York City on this day; in 1884 another parade was held, and it was decided that this day should be set apart for this purpose. In 1887 Colorado made the first Monday in September a legal holiday; and in 1909 Labor Day was observed as a holiday throughout the United States, except in Arizona and North Dakota; in Louisiana it is a holiday only in New Orleans (Orleans parish), and in Maryland, Wyoming and New Mexico it is not established as a holiday by statute, but in each may be proclaimed as such in any year by the governor.

LABOURBOULE, a watering-place of central France, in the department of Puy-de-Dôme, 44 m. W. by N. of Mont-Dore by road. Pop. (1906) 1401. La Boubolle is situated on the right bank of the Dordogne at a height of 2790 ft. Its waters, of which arsenic is the characteristic constituent, are used in cases of diseases of the skin and respiratory organs, rheumatism, neuralgia, &c. Though known to the Romans they were not in much repute till towards the end of the 19th century. The town has three thermal establishments and a casinò.

LABOUR CHURCH, THE, an organization intended to give expression to the religion of the labour movement. This religion is not theological—it leaves theological questions to private individual conviction—but "seeks the realization of universal well-being by the establishment of Socialism—a commonwealth founded upon justice and love." It asserts that "improvement of social conditions and the development of personal character are both essential to emancipation from social and moral bondage, and to that end insists upon the duty of studying the economic and moral forces of society." The first Labour Church was founded at Manchester (England) in October 1891 by a Unitarian minister, John Trevor. This has disappeared, but vigorous successors have been established not only in the neighbourhood, but in Bradford, Birmingham, London, Wolverhampton and other centres of industry, about 30 in all, with a membership of 3000. Many branches of the Independent Labour Party and the Social Democratic Federation also hold Sunday gatherings for adults and children, using the Labour Church hymn-book and a similar form of service, the reading being chosen from Dr Stanton Coit's Message of Man. There are special forms for child-naming, marriages and burials. The separate churches are federated in a Labour Church Union, which holds an annual conference and business meeting in March. At the conference of 1909, held in Ashton-under-Lyne, the name "Labour Church" was changed to "Socialist Church."

LA BOURDONNAY, BERTRAND FRANCOIS, Count Mahé de (1699-1753), French naval commander, was born at Saint Malo on the 11th of February 1699. He went to sea when a boy, and in 1718 entered the service of the French India Company as a lieutenant. In 1724 he was promoted captain, and displayed such bravery in the capture of Mahé of the Malabar coast that the name of the town was added to his own. For two years he was in the service of the Portuguese vicerey of Goa, but in 1735 he returned to French service as governor of the Île de France and the Île de Bourbon. His five years' administration of the islands was vigorous and successful. A visit to France in 1740 was interrupted by the outbreak of hostilities with Great Britain, and La Bourdonnais was put at the head of a fleet in Indian waters. He saved Mahé, relieved General Dupleix at Pondicherry, defeated Lord Peyton, and in 1746 participated in the siege of Madras. He quarrelled with Dupleix over the conduct of affairs in India, and his anger was increased on his return to the Île de France at finding a successor to himself installed there by his rival. He set sail on a Dutch vessel to present his case at court, and was captured by the British, but allowed to return to France on parole. Instead of securing a settlement of his quarrel with Dupleix, he was arrested (1748) on a charge of gubernatorial peculation and maladministration, and imprisoned for over two years in the Bastille. He was tried in 1751 and acquitted, but his health was broken by the imprisonment and by chagrín at the loss of his property. To the last he made unjust accusations against Dupleix. He died at Paris on the 10th of November 1753. The French government gave his widow a pension of 2400 livres.

La Bourdonnais wrote Traité de la nature des vaisseaux (Paris 1723), and left valuable memoirs which were published by his grandson, a celebrated chess player, Count L. C. Mahé de la Bourdonnais (1795-1840) (latest edition, Paris, 1890). His quarrel with Dupleix has given rise to much debate; for a long while the fault was generally laid to the arrogance and jealousy of Dupleix, but W. Cartwright and Colonel Malleson have pointed out that La Bourdonnais was proud, suspicious and over-ambitious.
LABOUR EXCHANGE—LABOUR LEGISLATION

In recent times in England there has been a notable disappearance from current use of correlative terms implying a social relationship, which is greatly changed, for example, in the rapid passage from the Master and Servant Act 1867 to the Employers' and Workmen Act 1875. In the 18th century the term "manufacturer" passed from its application to a working craftsman to its modern connotation of at least some command of capital, the employer being no longer a small working master. An even more significant change is seen in the steady development of a labour legislation, which arose in a clamant social need for the care of specially helpless "protected" persons in factories and mines, into a wider legislation for the promotion of general industrial health, safety and freedom for the worker from fraud in making or carrying out wage contracts.

If, then, we can discern these signs of important changes within so short a period, great caution is needed in rapidly reviewing long periods of time prior to that industrial revolution which is traced mainly to the application of mechanical power to machinery in aid of manual labour, practically begun and completed within the second half of the 18th century. In 1740 save for the fly-shuttle loom was as it had been since "weaver's hand and loom" (under the Act of Apprentices of 1563) "that wages in each district should be assessed by Justices of the Peace." Turning back to still earlier times, legislation—whatever its source or authority—must clearly be devoted to aims very different from modern aims in regulating labour, when it arose before the labourer, as a man dependent on an "employer" for the means of doing work, had appeared, and when migratory labour was almost unknown through the serfdom of part of the population and the special status secured in towns to the artisan.

In the great civilizations of antiquity there were great aggregations of labour which was not solely, though frequently it was predominantly, slave labour; and some of the features of manufacture and mining on a great scale arose, producing the same sort of evils and industrial maladies known and regulated in our own times. Some of the maladies were described by Pliny and classed as "diseases of slaves." And he gave descriptions of processes, for example in the metal trades, as belonging entirely to his own day, which modern archaeological discoveries trace back through the earliest known Aryan civilizations to a pre-historic origin in the East, and which have never died out in western Europe, but can be traced in a concentrated manufacture with almost unchanged methods, now in France, now in Germany, now in England.

Little would be gained in such a sketch as this by an endeavour to piece together the scattered and scanty materials for a comparative history of the varying conditions and methods of labour regulation over so enormous a range. While our knowledge continually increases of the remains of ancient craft, skill and massed labour, much has yet to be discovered that may throw light on methods of organization of the labourers. While much, and in some civilizations most, of the labour was compulsory or forced, it is clear that too much has been sometimes assumed, and it is by no means certain that even the pyramids of Egypt, much less the beautiful earliest Egyptian products in metal work, weaving and other skilled craft work, were typical of the conditions in Rome. It was only at times that the proportion of slaves valued as property was greater than that of hired workers, or, apart from capture in war or self-surrender in discharge of a debt, that purchase of slaves by the trader, manufacturer or agriculturist was generally considered the cheapest means of securing labour. As in early England the various stages of village industrial life, medieval town manufacture, and organization in craft guilds, and the beginnings of the mercantile system, were parallel with a greater or less prevalence of serfdom and even with the presence in part of slavery, so in other ages and civilizations the various methods of organization of labour are found to some extent together. The Germans in their primitive settlements were accustomed to the notion of slavery, and in the decline of the

1. The term "labour" (Lat. labor) means strictly any energetic work, though in general it implies hard work, but in modern parlance it is specially confined to industrial work of the kind done by the "working classes."

Roman Empire Roman captives from among the most useful craftsmen were carried away by their northern conquerors. The history and present details of the labour laws of various countries are dealt with below in successive sections: (1) history of legislation in the United Kingdom; (2) the results as shown by the law in force in 1900, with the corresponding facts for (3) Continental Europe and (4) the United States. Under other headings (Trade-Unions, Strikes and Lock-Outs, Arbitration and Conciliation, &c., &c.) are many details on cognate subjects.

1. History in the United Kingdom

1. Until the Close of the 15th Century.—Of the main conditions of industrial labour in early Anglo-Saxon England details are scanty. Monastic industrial communities were added in Christian times to village industrial communities. While generally husbandry was the first object of toil, and developed under elaborate regulation in the manorial system, still a considerable variety of industries grew up, the aim being expressly to make each social group self-sufficing, and to protect and regulate village artisans in the interest of village resources. This protective system, resting on a communal or co-operative view of labour and social life, has been compared as analogous to the much later and wider system under which the main purpose was to keep England as a whole self-sufficing. It has also been shown how greatly a fresh spirit of enterprise in industry and trade was stimulated first by the Danish and next by the Norman invasion; the former brought in a vigour shown in growth of villages, increase in number of freemen, and formation of trading towns; the latter especially opened up new communications with the most civilized continental people, and was followed by a considerable immigration of artisans, particularly of Flemings. In Saxon England slavery in the strictest sense existed, as is shown in the earliest English laws, but it seems that the true slave class as distinct from the serf class was comparatively small, and it may well be that the labour of an ordinary serf was not practically more severe, and the remuneration in maintenance and kind not much less than that of agricultural labourers in recent times. In spite of the steady protest of the Church, slavery (as the exception, not the general rule) did not die out for many centuries, and was apt to be revived as a punishment for criminals, e.g. in the fierce provisions of the statute of Edward VI. against beggars, not repealed until 1597. At no time, however, was it general, and as the larger village and city populations grew the ratio of serfs and slaves to the freemen in the whole population rapidly diminished, for the city populations "had not the habit and use of slavery," and while serfs might sometimes find a refuge in the cities from exceptionally severe taskmasters, "there is no doubt that free men gradually united with them under the lord's protection, that strangers engaged in trade sojourning among them, and that a race of artisans gradually grew up in which original class feelings were greatly modified." From these conditions grew two parallel, but independent, industries, the larger and more urban of which, peculiarly English, was the craft, and there was, under royal charters, the burgh or municipal organization and control of artisan and craft labour, passing later into the more specialized organization in craft guilds; on the other hand, there was a necessity, sometimes acute, to prevent undue diminution in the numbers available for husbandry or agricultural labour. To the latter cause must be traced a provision appearing in a succession of statutes (see especially an act of Richard II., 1388), that a child under twelve years once employed in agriculture might never be transferred to apprenticeship in a craft. The steady development of England, first as a wool-growing, later as a cloth-producing country, would accentuate this difficulty. During the 13th century, side by side with development of trading companies for the export of wool from England, may be noted many agreements on the part of monasteries to sell their wool to Florentines, and during the same century absorption of alien artisans into the municipal system was practically completed. Charters of Henry I. provided for naturalization of these aliens. From the time of Edward I. to Edward III. a gradual transference of burgh customs, so far as recognized for the common good, to statute law was in progress, together with an assertion of the rights of the crown against ecclesiastical orders. "The statutes of Edward I," says Dr. Cunningham, "mark the first attempt to deal with Industry and Trade as a public matter which concerns the whole state, not as the particular affair of leading men in each separate locality." The first direct legislation for labour by statute, however, is not earlier than the twenty-third year of the reign of Edward III., and it arose in an attempt to control the decay and ruin, both in rural and urban districts, which followed the Hundred Years' War, and the pestilence known as the Black Death. This first "Statute of Labourers" was designed for the benefit of the community, not for the protection of labour or prevention of oppression, and the policy of enforcing customary wages and compelling the able-bodied labourer, whether free or bond, not living in merchandise or exercising any craft, to work for hire at recognized rates of pay, must be reviewed in the circumstances and ideals of the time. Regulation generally in the middle ages aimed at preventing an individual or section of the community from making what was considered an exceptional profit through the necessity of others. The scarcity of labour by the reduction of the population through pestilence was not admitted as a justification for the demands for increased pay, and while the unemployed labourer was liable to be committed to gaol if he refused service at current rates, the lords of the towns or manors who promised or paid more to their servants were liable to be sued treble the sum in question. Similar restrictions were made applicable to artificers and workmen. By another statute, two years later, labourers or artificers who left their work and went into another county were liable to be arrested by the sheriff and brought back. These and similar provisions with similar aims were confirmed by statutes of 1360, 1368 and 1388, but the act of 1360, while prohibiting "all alliances and covins of masons, carpenters, congregations, chapters, ordinances and oaths between them," allowed "every bond to bargain or covenant for their works in gross with such labourers and artificers when it pleaseth them, so that they perform such works well and lawfully according to the bargain and covenant with them thereof made." Powers were given by the acts of 1368 and 1388 to justices to determine matters under these statutes and to fix wages. Records show that workmen of various descriptions were pressed by writs addressed to sheriffs to work for their king at wages regardless of their will as to terms and place of work. These proceedings were founded on notions of royal prerogative, of which impressment of seamen survived as an example to a far later date. By an act of 1388 no servant or labourer, man or woman, however, could depart out of the hundred to serve elsewhere unless bearing a letter patent under the king's seal stating the cause of going and time of return. Such provisions would appear to have widely failed in their purpose, for an act of 1414 declares that, while "the many ordinances and laws of earlier times are out of favour," the justices were empowered to send writs to the sheriffs for fugitive labourers as for felons, and to examine labourers, servants and their masters, as well as artificers, and to punish them on confession. An act of 1405, while putting a property qualification on apprenticeship and requiring parents under heavy penalties to put their children to such labour as their estates required, made a reservation giving freedom to any person "to send their children to school to learn literature." Up to the end of the 15th century a monotonous succession of statutes strengthening, modifying, amending the various statutes (since the first Statute of Labourers) to limit free movement of labour, or demands by labourers for increased wages, may be seen in the acts of 1411, 1427, 1444, 1495. It was clearly found extremely difficult, if not impracticable, to carry out the minute control of wages considered desirable, and exceptions in favour of certain occupations were in some of the statutes themselves. In 1512 the penalties for giving wages contrary to law were repealed so...
UNITED KINGDOM | LABOUR LEGISLATION

far as related to masters, but it also appears that London workmen would not endure the prevalent restrictions as to wages, and that they secured in practice a greater freedom to arrange rates when working within the city. Several of these statutes, and especially one of 1514, fixed the hours of labour when limiting wages. During March to September the limits were 5 A.M. to 7 or 8 P.M., with half an hour off for breakfast and an hour and a half off for midday dinner. In winter the outside limits were fixed by the length of daylight.

Throughout the 15th century the rapidly increasing manufacture of cloth was subject to a regulation which aimed at maintaining the standard of production and prevention of bad workmanship, and the noteworthy statute 4 Edward IV. c. 1, while giving power to royal officers to supervise size of cloths, modes of sealing, &c., also repressed payment to workers in "pins, girdles and unprofitable wares," and ordained payment in true and lawful money. This statute (the first against "Truck") gives an interesting picture of the way in which clothiers—or, as we should call them, wholesale merchants and manufacturers—delivered wool to spinners, carders, &c., by weight, and paid for the work when bought back finished. It appears that the work was carried on in rural as well as town districts. While this industry was growing and thriving other trades remained backward, and agriculture was in a depressed condition. Craft gilds had primarily the same purpose as the Edwardian statutes, that is, of securing that the public should be well served with good wares, and that the trade and manufacture itself should be on a sound basis as to quality of products and should flourish. Incidentally there was considerable regulation by the gilds of the conditions of labour, but not primarily in the interests of the labourer. Thus night work was prohibited because it tended to secrecy and so to bad execution of work; working on holidays was prohibited to secure fair play between craftsmen and so on. The position of apprentices was made clear through indentures, but the position of journeymen was less certain. Signs are not wanting of a struggle between journeymen and masters, and towards the end of the 15th century masters themselves, in at least the great wool trade, tended to develop from craftsmen into something more like the modern capitalist employer; from an act of 1555 touching weavers it is quite clear that this development had greatly advanced and that cloth-making was carried on largely by employers with large capitals. Before this, however, while a struggle went on between the town authorities and the craft gilds, journeymen began to form companies of their own, and the result of the various conflicts may be seen in an act of Henry VI., providing that in future new ordinances of gilds shall be submitted to justices of the peace—a measure which was strengthened in 1503.

2. From Tudor Days until the Close of the 18th Century.—A detailed history of labour regulation in the 16th century would include some account of the Tudor laws against vagrancy and methods of dealing with the increase of pauperism, attributable, at least in part, to the dissolution of the monasteries under Henry VIII., and to the confiscation of craft gild funds, which proceeded under Somerset and Edward VI. It is sufficient here to point to the general recognition of the public right to compel labourers to work and thus secure control of unemployed as well as employed. The statutes of Henry VIII. and Edward VI. against vagrancy differed rather in degree of severity than in principle from legislation for similar purposes in previous and subsequent reigns. The Statute of Labourers, passed in the fifth year of Elizabeth's reign (1562), as well as the poor law of the same year, was to a considerable extent both a consolidating and an amending code of law, and was so securely based on public opinion and deeply rooted custom that it was maintained in force for two centuries. It avowedly approves of principles and aims in earlier acts, regulating wages, punishing refusal to work, and preventing free migration of labour. It makes, however, a great advance in its express aim of protecting the poor labourer against insufficiency of wages, and of deposing a machinery, by frequent meeting of justices, which might yield "unto the hired person both in time of scarcity and in time of plenty a convenient proportion of wages." Minute regulations were made governing the contract between master and servant, and their mutual rights and obligations on parallel lines for (a) artificers, (b) labourers in husbandry. Hiring was to be by the year, and any unemployed person qualified in either calling was bound to accept service on pain of imprisonment, if required, unless possessed of property of a specified amount or engaged in art, science or letters, or being a "gentleman." Persons leaving a service were bound to obtain a testimonial, and might not be taken into fresh employment without producing such testimonial, or, if in a new district, until after showing it to the authorities of the place. A master might be fined £5, and a labourer imprisoned, and if contumacious, whipped, for breach of this rule. The carefully devised scheme for technical training of apprentices embodied to a considerable extent the methods and experiences of the craft gilds. Hours of labour were as follows: "All artificers and labourers being hired for wages by the day or week shall, betwixt the midst of the months of March and September, be and continue at their work, or before 5 o' clock in the morning and continue at work and not depart until betwixt 7 and 8 o'clock at night, except it be in the time of breakfast, dinner or drinking, the which time at the most shall not exceed two hours and a half in a day, that is to say, at every drinking half an hour, for his dinner one hour and for his sleep when he is allowed to sleep, the which is from the midst of May to the midst of August, half an hour; and all the said artificers and labourers betwixt the midst of September and the midst of March shall be and continue at their work from the spring of the day in the morning until the night of the same day, except it be in time afore appointed for breakfast and dinner, upon pain to lose and forfeit one penny for every hour's absence, to be deducted and defaulked out of his wages that shall so offend." Although the standpoint of the Factory Act and Truck Act in force at the beginning of the 20th century as regards hours of labour or regulation of fines deducted from wages is completely reversed, yet the difference is not great between the average length of hours of labour permissible under the present law for women and those hours imposed upon the adult labourer in Elizabeth's statute. Apart from the standpoint of compulsory imposition of fines, one advantage in the definiteness of amount deductible from wages would appear to lie on the side of the earlier statute.

Three points remain to be touched on in connexion with the Elizabethan poor law. In addition to (a) consolidation of measures for setting vagrants to work, we find the first compulsory contributions from the well-to-do towards poor relief there provided for, (b) at least a theoretical recognition of a right as well as an obligation on the part of the labourer to be hired, (c) careful provision for the apprenticing of destitute children and orphans to a trade.

One provision of considerable interest arose in Scotland, which was nearly a century later in organizing provisions for fixing conditions of hire and wages of workmen, labourers and servants, similar to those consolidated in the Elizabethan Statute of Labourers. In 1617 it was provided (and reaffirmed in 1661) that power should be given to the sheriffs to compel payment of wages, "that servants may be the more willing to obey the ordinance." The difficulties in regulation of compulsory labour in Scotland must, however, have been great, for in 1672 houses of correction were erected for disobedient servants, and masters of these houses were empowered to force them to work and to correct them according to their deserts. While servants in manufacture were compelled to work at reasonable rates they might not enter on a new hire without their previous master's consent.

Such legislation continued, at least theoretically, in force until the awakening effected by the beginning of the industrial revolution—that is, until the combined effects of steady concentration in capital in the hands of employers and expansion of trade, followed closely by an unprecedented development of invention in machinery and application of power to its use.
and control of the working hours of the children. A resolution by the county justices followed, in which they declared their intention in future to refuse "indentures of parish Apprentices whereby they shall be bound to Owners of Cotton Mills and other works in which children are obliged to work in the night or more than ten hours in the day." In 1795 the Manchester Board of Health was formed, which, with fuller information, more definitely advised legislation for the regulation of the hours and conditions of labour in factories. In 1802 the Health and Morals of Apprentices Act was passed, which in effect formed the first step towards prevention of injury to and protection of labour in factories. It was directly aimed only at evils of the apprentice system, under which large numbers of pauper children were worked in cotton and woollen mills without education, for excessive hours, under wretched conditions. It did not apply to places employing fewer than twenty persons or three apprentices, and it applied the principle of limitation of hours (to twelve a day) and abolition of night work, as well as educational requirements, only to apprentices. Religious teaching and suitable sleeping accommodation and clothing were provided for in the Act, also as regards apprentices. Lime-washing and the employment of apprentices for ten hours was allowed. However, the Act excluded the employments in the cotton factories, and these provisions applied to all cotton and woollen factories employing more than twenty persons. "Visitors" were to be appointed by county justices for repression of contraventions, and were empowered to "direct the adoption of such sanitary regulations as they might on advice think proper." The mills were to be registered by the clerk of the peace, and justices had power to inflict fines of from £2 to £5 for contraventions. Although enforcement of the very limited provisions of the act was in many cases poor or non-existent, in some districts excellent work was done by justices, and in 1803 the West Riding of Yorkshire justices passed a resolution substituting the ten hours' limit for the twelve hours' limit of the act, as a condition of permission for indenturing of apprentices in mills.

Rapid development of the application of steam power to manufacture led to growth of employment of children in populous centres, otherwise than on the apprenticeship system, and before long the evils attendant on this change brought the general question of regulation and protection of child labour in textile factories to the fore. The act of 1819, limited as it was, was a noteworthy step forward, in that it dealt with this wider scope of employment of children in cotton factories, and it is satisfactory to record that it was the outcome of the efforts and practical experiments of a great manufacturer, Robert Owen. Its provisions fell on every point lower than the aims he put forward on his own experience as practicable, and notably in its application only to cotton mills instead of all textile factories. Prohibition of child labour under nine years of age and limitation of the working day to twelve in the twenty-four (without specifying the precise hour of beginning and closing) were the main provisions of this act. No provision was made for enforcement of the law beyond such as was attempted in the act of 1802. Slight amendments were attempted in the acts of 1825 and 1831, but the first really important factory act was in 1833 applying to textile factories generally. The employment of young persons under eighteen years of age, as well as children, prohibiting night work between 8.30 p.m. and 5.30 a.m., and first providing for "inspectors" to enforce the law. This is the act which was based on the devoted efforts of Michael Sadler, with whose name in this connexion that of Lord Ashley, afterwards earl of Shaftesbury, was from 1832 associated. The importance of this act lay in its provision for skilled inspection and thus for enforcement of the law by an independent body of men unconnected with the locality in which the manufactures lay, whose specialization in their work enabled them to acquire information needed for further development of legislation for protection of labour. Their powers were to a certain extent judicial, being assimilated to those possessed by the slave; they could administer oaths and make such "rules, regulations and orders" as were necessary for execution of the act, and could hear complaints and impose penalties under the act. In 1844 a textile factory act modified these extensive

Labour Legislation

Inspectors and organizing the service on lines resembling those of our own time, and added provision for certifying surgeons to examine workers under sixteen years of age to physical fitness for employment and to grant certificates of age and ordinary strength. Hours of labour, by the act of 1833, were limited for children under eleven to 9 a day or 48 in the week, and for young persons under eighteen to 12 a day or 69 in the week. Between 1833 and 1844 the movement in favour of a ten hours’ day, which had long been in progress, reached its height in a time of great commercial and industrial distress, but could not be carried into effect until 1847. By the act of 1844 the hours of adult women were first regulated, and were limited (as were already those of “young persons”) to 12 a day; children were permitted either to work the same hours on alternate days or “half-time,” with compulsory school attendance as a condition of their employment. The aim in thus adjusting the hours of the three classes of workers was to provide for a practical standard working-day. For the first time detailed provisions for health and safety began to make their appearance in the law. Penal compensation for preventible injuries due to unfenced machinery was also provided, and appears to have been the outcome of a discussion by witnesses before the Royal Commission on Labour of Young Persons in Mines and Manufactures in 1841.

From this date, 1841, begin the first attempts at protective legislation for labour in mining. The first Mines Act of 1842 following the terrible revelations of the Royal Commission referred to excluded women and girls from underground working, and limited the employment of boys, excluding from underground working those under ten years, but it was not until 1850 that systematic reporting of fatal accidents and until 1855 that other safeguards for health, life and limb in mines were seriously provided by law. With the exception of regulations against truck there was no protection for the miner before 1842; before 1814 it was not customary to hold inquests on miners killed by accidents in mines. From 1842 onwards considerable interaction in the development of the two sets of acts (mines and factories), as regards special protection against industrial injury to health and limb, took place, both in Parliament and in the department (Home Office) administering them. Another strong influence tending towards ultimate development of scientific protection of health and life in industry began in the work and reports of the series of sanitary commissions and the Board of Health reports from 1843 onwards. In 1844 the mines inspector made his first report, but two years later women were still employed to some extent underground. Organized inspection began in 1850, and in 1854 the Select Committee on Accidents adopted a suggestion of the inspectors for legislative extension of the practice of several colliery owners in framing special safety rules for working in mines. The act of 1855 provided seven general rules, relating to ventilation, fencing of disused shafts, proper means for signalling, proper gauges and valve for steam-boiler, indicator and brake for machine lowering and raising; also it provided that detailed special rules submitted by mine-owners to the secretaries of state, might, on his approval, have the force of law and be enforceable by penalty. The Mines Act of 1860, besides extending the law to ironstone mines, following as it did on a series of disastrous accidents and explosions, strengthened some of the provisions for safety. At several inquests strong evidence was given of incompetent management and neglect of rules, and a demand was made for enforcing employment only of certified managers of coal mines. This was not met until the act of 1872, but in 1860 certain sections relating to wages and education were introduced. Steady development of the coal industry, increasing association among miners, and increased scientific knowledge of means of ventilation and of other methods for securing safety, all paved the way to the Coal Mines Act of 1872, and in the same year health and safety in metalliferous mines received their first legislative treatment in a code of similar scope and character to that of the Coal Mines Act. This act was amended in 1886, and repealed and recodified in 1887; its principal provisions are still in force, with certain revised special rules and modifications as regards reporting of accidents (1896) and employment of children (1903). It was based on the recommendations of a Royal Commission, which had reported in 1864, and which had shown the grave excess of mortality and sickness among metalliferous miners, attributed to the inhalation of gritty particles, imperfect ventilation, great changes of temperature, excessive physical exertion, exposure to wet, and other causes. The prohibition of employment of women and of boys under ten years underground in this class of mines, as well as in coal mines, had been effected by the act of 1842, and inspection had been provided for in the act of 1866; these were in amended form included in the code of 1872, the age of employment of boys underground being raised to twelve. In the Coal Mines Act of 1872 we see the first important effort to provide a complete code of regulation for the special dangers to health, life and limb in coal mines apart from other mines; it applied to “mines of coal, mines of stratified ironstone, mines of shale and mines of fire-clay.” Unlike the companion act—applying to all other mines—it maintained the age limit of entering underground employment for boys at five years, but for the years between ten and twelve it provided for a system of working analogous to the half-time system in factories, including compulsory school attendance. The limits of employment for boys from twelve to sixteen were 10 hours in any one day and 42 in any one week. The chief characteristics of the act lay in extension of the “general” safety rules, improvement of the method of formulating “special” safety rules, provision for certificated and competent management, and increased inspection. Several important matters were transferred from the special to the general rules, such as compulsory use of safety lamps where needed, regulation of use of explosives, and securing of roofs and sides. Special rules, before being submitted to the secretary of state for approval, must be posted in the mine for two weeks, with a notice that objections might be sent by any person employed to the district inspector. Wilful neglect of safety provisions became punishable in the case of employers as well as miners by imprisonment and hard labour. But the most important new step lay in the sections relating to daily control and supervision of every mine by a manager holding a certificate of competency from the secretary of state, after examination by a board of examiners appointed by the secretary of state, power being retained for him to cause later inquiry into competency of the holder of the certificate, and to cancel or suspend the certificate in case of proved unfitness.

Returning to the development of factory and workshop law from the year 1844, the main line of effort—after the act of 1847 had restricted hours of women and young persons to 10 a day and fixed the daily limits between 6 A.M. and 6 P.M. (Saturday 6 A.M. to 2 P.M.)—lay in bringing trade after trade in some degree under the scope of this branch of law, which had hitherto only regulated conditions in textile factories. Bleaching and dyeing works were included by the acts of 1866 and 1862; lace factories by that of 1861; calendering and finishing by acts of 1863 and 1864; bakehouses became partially regulated by an act of 1866, with special reference to local authorities for administration of its clauses. The report of the third Children’s Employment Commission brought together in accessible form the miserable facts relating to child labour in a number of unregulated industries in the year 1862, and the act of 1864 brought some of (these earthenware-making, lucifer match-making, percussion cap and cartridge making, paper-staining, and fustian cutting) partly under the scope of the various textile factory acts in force. A larger addition of trades was made three years later, but the act of 1864 is particularly interesting in that it first embodied some of the results of inquiries of expert medical and sanitary commissioners, by requiring ventilation to be applied to the removal of injurious gases, dust, and other impurities generated in manufacture, and made a first attempt to engraft part of the special rules system from the mines acts. The provisions for framing such rules disappeared in the Consolidating Act of 1878, to be revived in a better form later.
The Sanitary Act of 1866, administered by local authorities, provided for general sanitation in any factories and workshops not under existing factory acts, and the Factories Regulation Act of 1867, similarly to be administered by local authorities, amended in 1870, practically completed the application of the main principle of the factory acts to all places in which manual labour was exercised for gain in the making or finishing of articles or parts of articles for sale. A few specially dangerous or injurious trades brought under regulation in 1864 and 1867 (e.g. earthenware and lucifer match making, glass-making) ranked as “factories,” although not using mechanical power, and for a time employment of less than fifty persons relegated certain work-places to the category of “workshops,” but broadly the presence or absence of such motor power in aid of process was made and has remained the distinction between factories and workshops. The Factory Act of 1874, the last of the series before the great Consolidating Act of 1878, raised the minimum age of employment for children to ten years in textile factories. In most of the great inquiries into conditions of child labour the fact has come clearly to light, in regard to textile and non-textile trades alike, that parents as much as any employers have been less interested too little in keeping under proper control the hours of employment of children, and from early times until to-day in factory legislation it has been recognized that they must to some extent be held responsible for due observation of the limits imposed. For example, in 1861 it was found necessary to protect occupiers against parental responsibility for false certificates of age, and in 1863 parents of a child or “any Person having any benefit from the wages of such child” were made to share responsibility for employment of children without school attendance or beyond legal hours.

During the discussions on the bill which became law in 1874, it had become apparent that revision and consolidation of the multiplicity of statutes then regulating manufacturing industry had become pressingly necessary; modifications and exceptions for exceptional conditions in separate industries needed reconsideration and systematization on clear principles, and the main requirements of the law could with great advantage be applied more generally to all the industries. In particular, the daily limits as to period of employment, pauses for meals, and holidays might be unified for non-textile factories and workshops, so as to bring about a standard working-day, and thus prevent the tendency in “the larger establishments to farm out work among the smaller, where it is done under less favourable conditions both sanitary and educational.” 1 In these main directions, and that of simplifying definitions, summarizing special sanitary provisions that had been gradually introduced for various trades, and centralizing and improving the organization of the inspectorate, the Commission of 1876 on the Factory Acts made its recommendations, and the Factory Act of 1878 took effect. In the fixed working-day, provisions for pauses, holidays, general and special exceptions, distinctions between systems of employment for children, young persons and women, education of children and certificates of fitness for children and young persons, limited regulation of domestic workshops, general principles of administration and definitions, the law of 1878 was made practically the same as that embodied in the later principal act of 1901. More or less completely reviewable sanitary conditions in workshops (since 1801 primarily enforced by the local sanitary authority); (b) provision for reporting accidents and for enforcing safety (other than fencing of mill gearing and dangerous machinery); (c) detailed regulation of injurious and dangerous process and trades; (d) powers of certifying surgeons; (e) amount of overtime permissible (greatly reduced in amount and now confined to adults); (f) age for permissible employment of a child has been raised from ten years to twelve years. Entirely new since the act of 1878 are the provisions: (a) for control of outwork; (b) for supplying particulars of work and wages to piece-workers, enabling them to compute the total amount of wages payable to them; (e) extension of the act to laundries; (f) a tentative effort to limit the too early employment of mothers after childbirth.

II. LAW OF UNITED KINGDOM, 1910

Factories and Workshops.—The act of 1878 remained until 1901, although much had been meanwhile superimposed, a monument to the efforts of the great factory reformers of the first half of the 19th century, and the general groundwork of safety for workers in factories and workshops in the main divisions of sanitation, safety against accidents, physical fitness of workers, general limitation of hours and times of employment for young workers and women. The act of 1901, which came into force 1st January 1902 (and became the principal act), was an amending as well as a consolidating act. Comparison of the two acts shows, however, that, in spite of the advantages of further consolidation and helpful changes in arrangement of sections and important additions which tend towards a specialized hygiene for factory life, the fundamental features of the law as fought out in the 19th century remain undisturbed. So far as the law has altered in character, it has done so chiefly by general development of certain sanitary features, originally subordinate, and by strengthening provision for security against accidents and not by retreat from its earlier aims. At the same time a basis for possible new developments can be seen in the protection of "outworkers" as well as factory workers against fraudulent or defective particulars of piece-work rates of wages.

Later acts directly and indirectly affecting the law are certain acts of 1903, 1906, 1907, to be touched on presently.

The act of 1878, in a series of acts from 1883 to 1895, received striking additions, based (1) on the experience gained in other branches of protective legislation, e.g. development of the method of regulation of dangerous trades by "special rules" and administrative inquiry into accidents under Coal Mines Acts; (2) on the findings of royal commissions and parliamentary inquiries, e.g. increased control of "outwork" and domestic workshops, and limitation of "overtime"; (3) on the development of administrative machinery for enforcing the more modern law relating to public health, e.g. transference of administration of sanitary provisions into the hands of sanitary authorities; (4) on the trade-union demand for means for securing trustworthy records of wage-contracts between employer and workman, e.g. the section requiring particularis of work and wages for piece-workers. The first additions to the act of 1878 were, however, almost purely attempts to deal more adequately than had been attempted in the code of 1878 with certain striking instances of trades injurious to health. Thus the Factory and Workshop Act of 1883 provided that white-lead factories should not be carried on without a certificate of conformity with certain conditions, and also made provision for special rules, on lines later superseded by those laid down in the act of 1891, applicable to any employment in a factory or workshop certified as dangerous or injurious by the secretary of state. The act of 1883 also dealt with sanitary conditions in bakehouses. Certain definitions and explanations of previous enactments touching overtime and employment of a child in any factory or workshop were also included in the act. A clause of factory in which excessive heat and humidity was specially affected the heated and hot workshop, with a note added to the Cotton Cloth Factories Act 1889. This provided for special notice to the chief inspector from all occupiers of cotton cloth factories (i.e. any room, shed, or workshop or part thereof in which weaving of cotton cloth is carried on) who intend to produce humidity by artificial means, regulated both temperature of workrooms and amount of moisture in the atmosphere, and provided for tests and records of the same; and fixed a standard minimum volume of fresh air (600 cub. ft.) to be admitted in every hour for every person employed in the factory. Power was retained for the secretary of state to modify by order the standard for the maximum limit of humidity of the atmosphere at any given temperature. A short act in 1890 extended this power to other measures for the protection of health.

1 Minutes of Evidence, House of Commons, 1876; quoted in History of Factory Legislation, by Harrison and Hutchinson, p. 179.
The special measures from 1878 to 1889 gave valuable precedents for further developments of special hygiene in factory life, but the next advance in the Factory and Workshop Act 1891, following the House of Lords Committee on the sweating system and the Berlin International Labour Conference, extended over much wider ground. Its principal objects were: (a) to render administration of the law relating to workshops more efficient, particularly as regards sanitation; with this end in view it made the primary controlling authority for sanitary matters in workshops the local sanitary authority (now the district council), acting by their officers, and giving them the powers of the less numerous body of factory inspectors, while at the same time the provisions of the Public Health Acts replaced in workshops the very similar sanitary provisions of the Factory Acts; (b) to provide for greater security against accidents and more efficient fencing of machinery in factories; (c) to extend the method of regulation of unhealthy or dangerous occupations by application of special rules and requirements to any incident of employment (other than in a domestic workshop) certified by the secretary of state to be dangerous or injurious to health or dangerous to life or limb; (d) to raise the age of employment of certain classes of young workers; (e) to provide for the employment of women immediately after childbirth; (f) to require particulars of rate of wages to be given work to piece-workers in certain branches of the textile industries; (g) to amend the act of 1878 in various subsidiary ways, with the view of improving the administration of its principles, e.g. by increasing the means of checking the amount of overtime worked, empowering inspectors to enter work-places used as dwellings without a justice’s warrant, and the imposition of minimum penalties in certain cases. On this act followed four years of greatly accelerated administrative activity. No fewer than sixteen trades were scheduled by the secretary of state as dangerous to health. The manner of preparing and establishing suitable rules was greatly modified by the act of 1901 and will be dealt with in that connexion.

The Factory and Workshop Act 1895 followed thus on a period of exercise of new powers of administrative regulation (the period being also that during which the Royal Commission on Labour made its wide survey of industrial conditions), and after two successive annual reports of the chief inspector of factories and certain recommendations of the committee of women inspectors, who in 1893 were first added to the inspectorate. Again, the chief features of an even wider legislative effort than that of 1891 were the increased stringency and definiteness of the measures for securing hygienic and safe conditions of work. Some of these measures, however, involved new principles, as in the provision for the prohibition of the use of a dangerous machine or structure by the order of a magistrate’s court, and the power to include in the special rules drawn up in pursuance of section 8 of the act of 1891, the prohibition of the employment of any class of persons, or the limitation of the period of employment of any class of persons in any process scheduled by order of the secretary of state. These last two powers have both been exercised, and with the exercise of the latter passed away, without opposition, the absolute freedom of the employer of the adult male labourer to carry on his manufacture without legislative limitation of the hours of labour. Second only in significance to these new developments was the addition, for the first time since 1867, of new classes of workplaces not covered by the general definitions in section 2 of the Consolidating Act of 1878, viz.: (a) laundries (with special conditions as to hours, &c.); (b) docks, wharves, quays, warehouses and premises on which machinery worked by power is temporarily used for the purpose of the construction of a building or any structural work in connexion with the building (for the purpose only of obtaining security against accidents). Other entirely new provisions in the act of 1895, later strengthened by the act of 1901, were the requirement of a reasonable temperature in workrooms, the requirement of laveratories for the use of persons employed in any department where poisonous substances are used, the obligation on occupiers and medical practitioners to report cases of industrial poisoning; and the penalties imposed on an employer wilfully allowing wearing apparel to be made, cleaned or repaired in a dwelling-house where an inmate is suffering from infectious disease. Another provision empowered the secretary of state to specify classes of outwork and areas with a view to the regulation of the sanitary condition of premises in which outworkers are employed. Owing to the conditions attached to its exercise, no case was found in which this power could come into operation, and the act of 1901 deals with the matter on new lines. The requirement of annual returns from occupiers of persons employed, and the competency of the person charged with infringing the act to give evidence in his defence, were important new provisions, as was also the adoption of the powers to direct a formal investigation of any accident on the lines laid down in section 45 of the Coal Mines Regulation Act 1887. Other sections, relating to sanitation and safety, were developments of previous regulations, e.g. the fixing of a standard of overcrowding, provision of sanitary accommodation separate for each sex where the standard of the Public Health Act Amendment Act of 1890 had not been adopted by the competent local sanitary authority, power to order a fan or other mechanical means to carry off injurious gas, vapour or other impurity (the previous power covering only dusting), and definition and limitation of the machinery and definition of accidents were made more precise, young persons were prohibited from cleaning dangerous machinery, and additional safeguards against risk of injury by fire or panic were introduced. On the question of employment the foremost amendments lay in the almost complete prohibition of overtime for young persons, and the restriction of the power of an employer to employ protected persons outside his factory or workshop in the same day that he had employed them in the factory or workshop. Under the head of particulars of work and wages to piece-workers an important new power, highly valued by the workers, was given to apply the principle with the necessary modifications by order of the secretary of state to industries other than textile and to outworkers as well as to those employed inside factories and workshops.

In 1899 an indirect modification of the limitation of employment of children was effected by the Elementary Education Amendment Act, which, by raising from eleven to twelve the minimum age at which a child may, by the previous power covering only dusting, be employed, made the partial exemption from the obligation to attend school, made it unlawful for an occupier to take into employment any child under twelve in such a manner as to prevent full-time attendance at school. The age of employment became generally thereby the same as it has been for employment at a mine above ground since 1887. The act of 1901 made the prohibition of employment of a child under twelve in a factory or workshop direct and absolute. Under the divisions of sanitation, safety, fitness for employment, special regulation of dangerous trades, special control of bakehouses, exceptional treatment of crameries, new methods of dealing with home work and outworkers, important additions were made to the general law by the act of 1901, as also in regulations for strengthened administrative control. New general sanitary provisions were those prescribing: (a) ventilation per se for every workroom, and empowering the secretary of state to fix a standard of sufficient ventilation; (b) drainage of wet floors; (c) the power of the secretary of state to define in certain cases what shall constitute sufficient and suitable sanitary accommodation. New safety provisions were those relating to—(a) Examination and reporting on steam boilers; (b) prohibition of employment of a child in cleaning below machinery in motion; (c) power of the district council to make by-laws for escape in case of fire. The most important administrative alterations were: (a) a justice engaged in the same trade as, or being officer of an association of persons engaged in the same trade as, a person charged with an offence may not act at the hearing and determination of the charge; (b) ordinary supervision of sanitary conditions under which outwork is carried on was transferred to the district council, power being reserved to the Home Office to intervene in case of neglect or default by any district council.
The Employment of Children Act 1903, while primarily providing for industries outside the scope of the Factory Act, incidentally secured that children employed as half-timers should not also be employed in other occupations. The Notice of Accidents Act 1906 amended the whole system of notification of accidents, simultaneously in mines, quarries, factories and workshops, and will be set out in following paragraphs. The Factory and Workshop Act of 1907 amended the law in respect of laundries by generally applying the provisions of 1901 to trade laundries while granting them choice of new exceptional periods, and by extending the provisions of the act (with certain powers to the Home Office by Orders laid before parliament to allow variations) to institution laundries carried on for charitable or reformatory purposes. The Employment of Women Act 1907 repealed an exemption in the act of 1901 (and earlier acts) relating to employment of women in flax scutch mills, thus bringing this employment under the ordinary provisions as to period of employment.

The following paragraphs aim at presenting an idea of the scope and the modified and amended law, as a whole, adding where clearly necessary reference to the effect of acts, which ceased to apply after the 31st of December 1901:

The workplaces to which the act applies are, first, "factories" and "workshops"; secondly, laundries, docks, wharves, &c., enumerated above as introduced and regulated partially only by the act of 1895 and subsequent acts. Apart from these two main groups, there are particular industries (such as the mines) which remain undefined by the law, the act may broadly be said to apply to premises, rooms or places in which manual labour, with or without the aid of mechanical power, is exercised for gain in or incident to the manufacture, preparation, finishing, or adapting for sale of any article or part of any article. If steam, water or other mechanical power is used in aid of the manufacturing process, the workplace is a factory; if not, it is a workshop. This division is subject to various qualifications. Workplaces which are brought under the factory law for reasons of safety, &c., before workshops generally were regulated which are defined as factories whether power is used in them or not. Factories are, again, subdivided into (a) factories in which there is no manufacturing process, but only work in preparing, manufacturing or finishing cotton, wool, hair, silk, flax, hemp, jute, tow, China grass, coconuts, fibre or other like material either separately or mixed together, or with any other material, or any fabric made thereof; all other factories are non-textile. The distinction turns on the historical origin of factory regulation and the regulations in textile factories remain in some respects still more stringent than in the non-textile factories and workshops, though the general provisions are almost the same. Three special classes of workplaces are particularly distinguished from ordinary workshops, which include tenement workshops, which include tenement workshops: (a) Domestic workshops, i.e. any private house, room or place, which, though used as a dwelling, is by reason of the work carried on in it, prohibited, or prejudicial to health or safety, or incapable of interference with the purity of the air in each room in which any person is employed; maintenance of sufficient means of ventilation in every room in a factory or workshop (in conformity with such standard as may be prescribed by order of the secretary of state) for workrooms and bakehouses shall be carried on in the factory or workshop, the paper shall be so made as to carry off injurious dust, gas or other impurity, and prevent their inhalation in any factory or workshop; drainage of floors where wet processes are carried on. For laundries and bakehouses there are also been widely adopted by local sanitation authorities for heating shall be sufficiently separated from any ironing-room or ironing-table, and the floors shall be "draining in such a manner as will allow the water to flow off freely." And in bakehouses a certificate of the parliamentary regulations may be made to increase security for health by special rules to be presently touched on. The secretary of state may also make sanitary regulations a condition of granting such exceptions to the general law as he is empowered to grant in the case of workshops, and in the case of workshops, the provisions of the act, inclusive of the regulations of hours and times of employment, apply. To adult men generally those provisions broadly only apply which are aimed at securing sanitation and safety. To the child and young persons, the age fourteen, young persons, i.e. boys or girls between the ages of fourteen (or if an educational certificate has been obtained, thirteen) and eighteen years of age, and women, i.e. females above the age of eighteen years, and no manufacturing process, or workrooms are members of the same family, dwelling there alone—in these women's hours are unrestricted; (b) Women's workshops, in which neither children nor young persons are employed—in these a more relative relations to employ is permitted and on whose where the occupier has used due diligence to enforce the execution of the act, and can show that another person, whether agent, servant, workman or other person, is the real offender; (b) specially in a factory the sections relating to employment of public and women may be applied, the owner or hirer of a machine or implement driven by mechanical power is some person other than the occupier of the factory, the owner or hirer, so far as respects any offence against the act committed in relation to a person who is employed in connexion with the machine or implement, and in the employment or pay of the owner or hirer, shall be deemed to be the occupier of the factory; (c) the above definitions of the person injured in any factory or workshop is bound under penalty immediately to report the same to the occupier; (d) so far as relates to sanitary conditions, fencing of machinery, affixing of notices, &c., the factory, and if no such machinery is provided until the contrary is shown. The act, however, does not apply to employment for the sole purpose of repairing the premises or machinery, nor to the process of preserving and curing fish immediately upon its arrival in the fishing districts, for purposes prescribed by law; nor to the process of cleaning and preparing fish so far as is necessary to prevent it from spoiling during the months of June, July, August and September. Certain light handicrafts carried on by a family may be carried on in the house or room at regular intervals are also outside the scope of the act.

The foremost provisions are those relating to the sanitary condition of the workplaces and the general security of every class of workers. Every factory is required to be kept free from noxious effluvia, ventilated in such a manner as to render harmless, so far as practicable, gases, fumes, dust or other impurities generated in the manufacture; and steam shall be kept from the air, &c. Sanitary regulations for women's hours and protective regulations are similarly laid down. Non-textile factories shall be kept free from effluvia, &c. Ventilation and sanitation of workplaces, including bakehouses, &c., are provided for. Although, primarily, only the provisions of the district council are included in the sanitary provisions in workshops, the government factory inspectors may give notice of any defect in them to the district council. Although sanitary provision must be made for the girls, they are not entitled to the protection the women only are entitled to.少女 enjoys the protection of the law, but for six months. Although, primarily, only the provisions of the district council are included in the sanitary provisions in workshops, the government factory inspectors may give notice of any defect in them to the district council. Although sanitary provision must be made for the girls, they are not entitled to the protection the women only are entitled to. Although, primarily, only the provisions of the district council are included in the sanitary provisions in workshops, the government factory inspectors may give notice of any defect in them to the district council. Although sanitary provision must be made for the girls, they are not entitled to the protection the women only are entitled to.
Security in the use of machinery is provided for by precautions as regards the cleaning of machinery in motion and working between the fixed and traversing parts of self-acting machines driven by power, by fencing of machinery, and by means of the summary jurisdiction to prohibit the use, temporarily or absolutely, of machinery, ways, works, or plant, including use of a steam boiler, which cannot be used without danger to life and limb. Each employee of such machinery, or the supervisory wheel or engine man, must be provided with a properly fenced power, and every part of a water-wheel or engine worked by mechanical power, and every wheel race, must be fenced, whatever its position, and every part of mill-gearing or dangerous machinery must be fenced. Any person who is not in such a position that it is as safe as if it were fenced. No protected persons may clean any part of mill-gearing in motion, and children may further not clean any part of or below manufacturing machinery in motion by aid of mechanical power; young persons also may not be employed in workshops, in London, the county council, or in case of default the factory inspector, can require certain provisions for escape in case of fire in factories and workshops in which more than forty persons are employed; special powers to make by-laws for means of escape from fire and precautions against the escape of molten metal; and prevention of fire that they possess, given to every district council, in London to the county council. The means of escape must be kept free from obstruction. Provisions are made for doors to open outward, and for the removal of any portion of the door to prevent the locking, bolting or fastening of doors so that they cannot be easily opened from inside when any person is employed or at meals inside the workplace. Further, provisions for security may be made in respect of those engaged in the manufacture of steam in a factory or workshop or place where the act applies must have a proper safety valve, a steam gauge, and a water gauge, and every such boiler, valve and gauge must be maintained in proper condition. Examination by a competent inspector must be made, at least once in every fourteen months. The occupier of any factory or workshop may be liable for penalties not exceeding £100 in case of death or injury due to the neglect of any provision or special regulations. The occupier of the factory or workshop must inform the employer of the injured person or his family, as the secretary of state determines. When a death has occurred by accident in a factory or workshop, the coroner must decide the process for the fact that the factory or workshop is not under the control of the occupier, and may order a formal investigation of the circumstances of any accident in the case of minor accidents. Careful and detailed provisions are made for the reporting by occupiers to inspectors, and entry in the registers at factories and workshops of accidents which occur in a factory or workshop and (a) cause death or loss of life to a person employed there, or (b) are due to machinery moved by mechanical power, molten metal, hot liquid, explosion, escape of gas or steam, electricity, or causing any person to be employed there or in the surroundings of the factory or workshop to be absent throughout at least one whole day from his ordinary work. (c) are due to any other special cause which the secretary of state may determine, (d) not falling under the heads (a) to (c) severally, and which are connected with the work in the factory or workshop. In the case of (a) or (b) notice has to be sent to the certifying surgeon by the occupier. Cases of lead, phosphorus, arsenical and mercurial poisoning, or anthrax, contracted in the factory or workshop, must be reported to the inspector, and, where necessary, an inspection shall be made of the factory or workshop. The occupier or the secretary of state may order the removal of persons employed under these provisions where the presence of these substances in the air or environment is likely to cause illness, injury, or death to those employed. Certificates of physical fitness for employment must be obtained by the occupier from the certifying surgeon for the district for all persons under eighteen years of age employed in a factory, and the certificates for the factories and workshops of the London County Council have been extended by order of the secretary of state, and an inspector may suspend any such persons for re-examining in a factory, or for examination in a workshop, when he shall not allow a woman to be employed therein for more than 40 hours a week. The employment of children, young persons, and women is regulated by the hours of work, to which the regulations apply, and the provisions regarding meals, work, and holidays. The outside limits of ordinary periods of employment and holidays are, broadly, the same for textile factories as for workshops, and are as follows: women, 35 hours per week; young persons, 42 hours per week; and children, 48 hours per week. The regulations provide for the making of exceptions to these limits in the requirements of not less than a total of two hours interval for meals out of the twelve, and a limit of four and a half hours for any spell of work, a longer weekly half holiday, and a prohibition of overtime, in textile factories, as compared with a total one and a half hours’ interval for meals and a limit of five hours for spells and (conditional) permission of overtime in non-textile factories. The hours of work must be specified, and from Monday to Friday may be between 6 A.M. and 6 P.M., or 7 A.M. to 7 P.M.; in non-textile factories, in certain districts, between 7 A.M. and 6 P.M. or 13½ hours from 8 A.M. to 9 P.M. Between these outside limits, with the proviso that meals must be fixed and limits as to spells, women and young persons must not be employed on the premises for more than 11 hours, or if less than one hour is given for meals (half an hour extra allowed for cleaning), and in non-textile factories and workshops at 2 P.M., 3 P.M. or 4 P.M.; according as the hour of beginning is 6 A.M., 7 A.M., or 8 A.M. respectively. For young persons and children must not exceed those allowed in ordinary workshops, but the outside limits for beginning and ending are wider, and the case is similar as regards hours of women in workshops. In the case of those engaged in the business of the same is limited in a manner similar to that laid down in the Shop Hours Act, to be touched on presently. Overtime in certain classes of factories, workshops and warehouses attached to them is permitted, under conditions specified in the acts, for any period of time not exceeding three hours. Persons engaged in the making, storage, or carrying of any goods or other substances from where goods of a pernicious nature are dealt with, for young persons only in a very limited degree in factories liable to stoppage for drought, flood, or an unfinished process; these and other cases, are excepted from wages, hours and conditions and carrier regulations. Broadly the same regulations as to overtime may apply in laundries but the act of 1907 granted to laundries not merely ancillary to the manufacture carried on in a factory, but of a wholly different kind from the workshops, to fix different periods of employment for different days of the week, and to make use of one or other of two exceptional methods of arranging the daily periods so as to permit of periods of different lengths in these exceptional periods. The latter sections of the act were not in force until 10 P.M. or before 6 A.M. Sunday work is prohibited except in cases where there are special conditions, for Jews; and in factories, workshops and laundries six holidays (generally the Bank holidays) are fixed by the secretary of state. Women and young persons employed in workshops, factories and workshops are fixed by the secretary of state may by special order vary the beginning and end of the daily period of employment, and allow employment for no more than three hours on the evening of the day of work. The general provisions of the act may be supplemental to provisions for the all special dangers or unhealthy trades are carried on, by special regulations. This provision was made for in the law in force until 31st December 1892 and the power to establish rules had been exercised between 1892 and 1901 in twenty-two trades or processes where injury arose either from handling dangerous substances, such as lead and lead compounds, phosphorus, arsenic, and various chemicals, or where there is inhalation of irritant dust or noxious fumes, or where there is danger of explosion or infection of anthrax. Before the rule could be drawn up under the acts of 1891 to 1895, the secretary of state had to certify that in the particular trade, the employer was “one of good repute”. In 1894, it was, in his opinion, danger to life or limb or risk of injury to health; thereupon the chief inspector might propose to the occupier of the factory or workshop such special rules or measures as he thought necessary for security or to propose modifications, but if he did not the rules became binding in twenty-one days; if he objected, and the secretary of state did not assent to any proposed modification, the matters in question had to be referred to an arbitrator who was appointed by the rules or requirement to be observed. In November 1901, in the case of the earthenware and china industry, the last arbitration of the kind was opened and was finally concluded in 1903. The parties to the arbitration were the chief inspector of factories and the secretary of state, but the Ion interests might be and were represented on the arbitration. In the establishment of the twenty-two sets of existing special rules only three arbitration been resorted to, and only on two of these occasions. The arbitrations were laid in the first schedule to the Act of 1891, and were similar to those under the Coal Mines Regulation Acts. Many of these codes have still the force of law and will continue until due
course revised under the amended procedure of the act of 1901. They might not only regulate conditions of employment, but also restrict or prohibit employment of any class of workers; where such restriction or prohibition affected adult workers the rules had to be laid down by the Home Secretary and those for children and women coming into operation. The obligation to observe the rules in detail lies on workers as well as on occupiers, and the section of the act of 1891 providing a penalty for non-observance was drafted, as in the first instance, to limit its application to employers and heighten their penalties as regards penalty for non-observance as in other matters under the act.

The certificate of the secretary of state that any manufacture, machinery, plant, process or manual labour used in factories or workshops is dangerous or injurious to life, health or limb, such regulations as appear to the secretary of state to make the necessity of the case may be made by him after he has duly published notice:

(1) of his intention; 
(2) of the place where copies of the draft regulations may be obtained; and 
(3) of the time during which objections to them may be made by persons affected. The secretary of state may modify the regulations to meet the objections made. If not, unless the objection is withdrawn or appears to him frivolous, he shall cause regulations to be framed which shall hold a public inquiry with regard to the draft regulations and to report to him thereon. The inquiry is to be made under such rules as the secretary of state may lay down, and when the regulations are made they may be extended to any extent by order of the Home Secretary. The House may annul these regulations or any of them, without prejudice to the power of the secretary of state to make new regulations. The regulations may apply to all factories or workshops in which the certificate of the secretary of state is used, or to a specified class. They may, among other things, (a) prohibit or limit employment of any person or class of persons; (b) prohibit, limit, or control use of any material or process; (c) modify or extend special regulations concerning persons, machines, and apparatus, as may be necessary; (d) in the sale of goods to those used in a factory or workshop for checking or ascertaining the wages of persons employed; (e) by ensuring that piece-workers in the textile trades (and in other trades specified by the secretary of state) receive, before commencing any piece of work, clear particulars of the wages applicable to the work to be done and of the work to which that rate is to be applied. Unless the particulars of work are ascertained to the satisfaction of an automatic indicator, they must be given to textile workers in writing, and in the case of weavers in the cotton, worsted and woollen trades the particulars of wages must be supplied separately to each worker, and also shown on a placard in a conspicuous position. In other textile processes, it is sufficient to furnish the particulars separately to each worker. The secretary of state has used his powers to extend this protection to non-textile workers, with suitable modifications, in various hardware industries, including the making of wearing apparel, in furrier cutting, umbrella-making, brush-making, and a number of other piece-work trades. The further has in most of these and other trades used his power to extend these protections to workers in those industries.

Measures and particulars to protect workers.

With a view to efficient administration of the act (a) certain notices have to be conspicuously exhibited at the factory or workshop, (b) registers and lists kept, and (c) notices sent to the inspector. Among the three most important are the prescribed abstract of the act, the names and addresses of the inspector and certifying surgeon, the period of employment, and specified meal-times (which may not be observed at a particular hour). The act further provides that the number of persons who may legally be employed in each room, and prescribed particulars of exceptional employment; among the second are the general registers of children and young persons employed, and the sworn evidence of those who have employed them, and those who have employed them, and who are the occupiers of factories or workshops, on the notification of vacancies and returns of persons employed, or summaries as may be prescribed. These must be sent to the chief inspector at intervals of not less than one and not more than three years, as may be directed by the secretary of state.

The secretary of state for the Home Department controls the administration of the acts, appoints the inspectors referred to in the act to superintend the observance of the regulations and in cases in which they are to exercise the powers of inspectors. The act, however, expressly assigns certain duties and powers to a chief inspector and certain to district inspectors. Many provisions of the act are directed to workpeople, and their duties and powers are expressly indicated, his orders guide or determine the action of district councils, and, generally, in case of default by a council he may empower his inspectors to act as regards workplaces, instead of the council, both under the rules of the Act of 1887 and the regulations made thereunder.

The powers of an inspector to enter, inspect and examine, by day or by night, at any reasonable time, any factory or workshop (or laundry, dock, &c.), or part of one, when he has reason to believe that any person is employed there: to take with him a constable if he has reasonable cause to expect obstruction; to require production of registers, certificates, &c., under the acts; to examine, alone or in the presence of any other person, as he sees fit, every person in the factory or workshop, or in a school where the children employed are being educated; to prosecute, conduct or defend before a court of summary jurisdiction any proceeding under the acts; and to exercise such other powers as are necessary for carrying the act into effect. The inspectors are given power to examine any person as to his fitness for the daily work during legal periods, with power to grant qualified certificates as to the work for which the young worker is fit, and (b) to investigate and report on accidents and cases of lead, phosphorus or other poisonous and anthrax. In 1907 there were registered under inspection 110,276 factories, including laundries with power, 146,917 workshops (other than men’s workshops), including laundries without power; of works under special rules or regulations (included in the figures just given) there were 19,386 and 19,687 non-textile works under orders for supply of particular to piece-workers. Of notices of accidents received there were 1,372, of which 1179 were fatal; of reported cases of poisoning there were 653, of which 40 were fatal. Prosecutions were taken by inspectors in 4474 cases and convictions obtained in 4211 cases. Of persons employed there were, according to returns of occupiers, 1904, 4,105,791 in factories and 658,750 in workshops.

Coal Mines.—The mode of progress to be recorded in the regulation of coal mines since 1872 can be contrasted in one aspect with the progress just recorded of factory legislation since 1878. Consolidation was again earlier adopted when large amendments were found necessary, with the result that by far the greater part of the law is to be found in the act of 1887, which repealed and re-enacted, with amendments, the Coal Mines Acts of 1872 and 1886, and the Stratifled Ironstone and Mantle Act, 1851. The act of 1881 was simply concerned with rules relating to the use of explosives underground. The act of 1886 dealt with three questions: (a) The election and payment of check weighers (i.e. the persons appointed and paid by miners in pursuance of section 13 of the act of 1887 for the purpose of taking a correct account on their behalf of the weight of the mineral gotten by them, and for the correct determination of certain deductions for which they may be liable); (b) provision for new powers of the secretary of state to direct a formal investigation of any explosion or accident, and its causes and circumstances, a provision which was later adopted in the law relating to factories; (c) provision enabling any relatives of persons whose death may have been caused by explosions or accidents in or about mines to attend in person, or by agent, coroners’ inquests thereon, and to examine witnesses. The act of 1887, which amended, strengthened and consolidated these earlier acts, was again in one aspect to be contrasted in another aspect with the special acts of factory legislation. In scope it formed, as its principal forerunner had done, a general code; and in some measure it went farther in the way of consolidation than the Factory Acts had done, inasmuch as certain questions, which in factories are dealt with
by statutes distinct from the Factory Acts, have been included in the Mines Regulation Acts, e.g. the prohibition of the payment of wages in public houses, and the machinery relating to weights and measures whereby miners control their payment; further, partly from the less changing nature of the industry, but probably  

mainly from the power of expression gained for miners by their organization, the code, so far as it went, at each stage answered apparently on the whole more nearly to the views and needs of the persons protected than the parallel law relating to factories.

This was strikingly seen in the evidence before the Royal Commission on Labour in 1892-1894, where the repeated expression of satisfaction on the part of the miners with the provisions as distinct from the administration of the code ("with a few trivial exceptions") is in marked contrast with the long and varied series of claims and contentions put forward for amendment of the Factory Acts.

Since the act of 1887 there have followed five minor acts, based on the recommendation of the officials acting under the acts, while two of them give effect to claims made by the miners before the Royal Commission on Labour. Thus, in 1894, the Coal Mines (Checkweigher) Act rendered it illegal for an employer ("owner, agent, or manager of any mine, or any person employed by or acting under the instructions of any such owner, agent, or manager") to make the removal of a particular checkweigher a condition of employment, or to exercise improper influence in the appointment of a checkweigher. The need for this provision was demonstrated by a decision of the Court of Session in Edinburgh, which upheld an employer in his claim to the right of dismissing all the workmen and re-engaging them on condition that they would dismiss a particular checkweigher.

In 1896 a short act extended the powers to propose, amend, and modify special rules, provided for representation of workmen in arbitration under the principal act on any miner in their district, modified the provisions for working in abandoned mines, amended three of the general rules (inspection before commencing work, use of safety lamp and non-inflammable substances for stemming), and empowered the secretary of state by order to prohibit or regulate the use of any explosive likely to become dangerous. In 1900 another brief act raised the age of employment of boys underground from twelve to thirteen.

In 1903 another amending act allowed as an alternative qualification for a manager's certificate a diploma in scientific and mining training at least two years' study at a university mining school or other educational institution approved by the secretary of state, coupled with practical experience of at least three years in a mine. In the same year the Employment of Children Act affected children in mines to the extent already indicated in connection with factories. In 1905 a Coal Mines (Works and Plans) Act imposed certain improvement works, and to appointment and pay of checkweighers and facilities for them, and their duly appointed deputies in carrying out their duties.

In 1906 the Notice of Accidents Act provided for annual returns of accidents and for immediate reporting to the district inspector of accidents under newly-defined conditions as they arise in coal and metalliferous mines.

While the classes of mines regulated by the act of 1887 are the same as those regulated by the act of 1872 (i.e. mines of coal, of stratified ironstone, of shale and of fire-clay, including working in a mine of coal, or any part of a mine, or the use of coal, the working of a surface coal mine, or the working of any coal underground in or adjacent to the mine, or any part thereof), the interpretation of the term "mine" is wider and simpler, including "every shaft in the course of being sunk, and every level and inclined plane in the course of being driven, and all the shafts, levels, planking works, tramways and sildings, both below ground and above ground, in and adjacent to and belonging to the mine." Of the persons protected under penalty for the observance of the acts the terms "owner," "manager," and "person acting under the owner" have been modified to mean "any person appointed as the representative of the owner in respect of any mine or any part thereof, and, as such, superior to a manager appointed in pursuance of this act." Of the persons protected, the term "young person" disappeared from the act, the expression "a female under the age of sixteen years," "take their place, and the term "woman" means, as before, "a female of the age of sixteen years and upwards." The prohibition of employment underground of women and girls remains untouched, and the prohibition of employment underground of boys has been successively extended from boys of the age of ten in 1872 to boys of twelve in 1887 and to boys of thirteen in 1900. The age of employment of boys and girls above ground in connexion with any mine is raised from 14 days to 18 months, and the hours of employment of a boy below ground may not exceed fifty-four in any one week, nor ten in any one day from the time of leaving the surface to the time of returning to the surface. Above ground any boy or girl of twelve (and any boy of thirteen) may work not more than six days in any one week; if employed on more than three days in one week, the daily total must not exceed six hours, or in any other case ten hours. Protected persons above thirteen are limited to the hours of work of an adult, but up to a maximum of four hours a day; they are, however, subject to further provisions with regard to intervals for meals and prohibiting employment for more than five hours without an interval of at least half an hour for a meal. Registers must be kept of all young persons employed, and the fines are increased.

Section 38 of the Public Health Act 1875, which requires separate and sufficient sanitary conveniences for persons of each sex, was first extended by the act of 1887 to the portions of mines above ground in which girls and women are employed; underground this matter is in metalliferous mines in Cornwall now provided for by special rules. Ventilation, the only other requirement in the acts that can be classed as sanitary, is provided for in every mine in the "general rules," which are aimed at securing safety of mines, and which, so far as ventilation is concerned, seek to dilute and render harmless noxious or inflammable gases. The provision which prohibits employment of any persons in mines not provided with at least two shafts is made more effective by the act of 1872. An additional condition, by increasing the distance between the two shafts from 10 to 15 yards, and increasing the height of communications between them. Other provisions amended or strengthened are those relating to the following points: (a) Determination of the periods for which certificates of manager; (b) classes of certificates and constitution of board for granting certificates of competency; (c) plan of workings of any mine to be kept up to a date not more than three months previously at the office of the secretary of state; (d) the giving of a list of the names of the district, the owner, agent, or manager, of accidents in or about any mine which cause loss of life or serious personal injury, or are caused by explosion of coal or coal dust or any explosive or electricity or any gas or water; (e) the giving of an order for the suspension of any workmen who are found to be causing a disaster or which causes any personal injury to any person employed in or about the mine; it is provided, that the place where an explosion or accident occurs causing loss of life or serious personal injury shall be left unoccupied for a period not exceeding three months; (f) the order to increase or continue a danger or impede working of the mine: this was new in the act of 1887; (g) notice to be given of opening and abandonment of any mine: this was extended to the opening or abandonment of seams which are not more than 10 yards distant in the seam, and the whole plan of workings must be sent within three months; (g) formal investigation of any explosion or accident by direction of the secretary of state: this provision, first introduced by the act of 1886, was modified in 1887 to require the appointment of any competent person to hold the investigation, whereas under the earlier section only an inspector could be appointed.

The "general rules" for safety in mines have been strengthened in many ways since 1872. The last-cited Act of 1877 provided for the making of rule 4 of the act of 1887, relating to the inspection of conditions as to gas ventilation beyond appointed stations at the entrance to the mine or different parts of the mine; this rule generally provides that the air of the mines in which inflammable gas has been found within the preceding twelve months, and mines in which it has not been so found, if rules 8, 9, 10 and 11, relating to the construction, use, &c., of safety lamps, which are more detailed and stringent than rule 7 of the act of 1872; which were replaced; of rule 12, relating to the use of explosives below ground; of rule 42, which requires the appointment of a competent male person not less than twenty-two years of age for working the mine, and of rules 62 and 63, relating to the ventilation of mine waste. Rule 43, which first required provision of ambulances or stretchers with splints and bandages at the mine ready for immediate use; of rule 38, which strengthened the provision for periodical inspection of the mine; and of rules 44, 62, 63, which provided for the ventilation and control of mines. With reference to the last-cited rule, during 1898 a Prussian mining commission visited Great Britain, France and Belgium, to study and compare the various methods of inspection by working underground, and the results of their labours are given in a report, which, so far as the method had been applied, was most satisfactory in Great Britain, where the whole cost is borne by the workers' own organization, and they attributed part of the decrease in number of accidents to the thousand employed since 1872 to the inauguration of this system.

The provisions as to the proposal, amendment and modification of "special rules," last extended by the act of 1896, may be compared with those of the Factory Act. In the latter it is not until an industry or process has been classified as dangerous or injurious by the secretary of state's order that occasion arises for the formation of special rules, and then the initiative rests with the Factory Department whereas in mines it is incumbent in every case on the owner, agent or manager.
to propose within three months of the commencement of any work, for the approval of the secretary of state, special rules best calculated to prevent dangerous accidents, and to provide for the safety, convenience and proper discipline of the persons employed in such work. These special rules may, if they relate to the use of lamps used in the mine, description of explosives, watering and damping of the mine, or prevention of accidents from inflammable gas or coal dust, supersede any general rule in the principal act. Apart from the introduction of special rules, the method of enforcing them, whether by agreement or by resort to arbitration of the parties (i.e. the mine owners and the secretary of state), are practically the same as under the Factories Act, but there is special provision in the latter act allowing any objection to the working the mine to transmit objections to the proposed rules, in addition to their subsequent right to be represented on the arbitration, if any.

Of the sections touching on wages questions, the prohibition of the piece-wage system publishes certain unions under the Act, re-enacted in 1887; the sections relating to payment by weight for amount of mineral gotten by persons employed, and for checking the amount by a "checkweigher" stationed by the majority of workers at each place, appointed for the weighting of the material, were revised, particularly as to the determination of deductions by the Act of 1874, with a view to meeting some problems raised by decisions on cases under the act of 1872. The attempt seems not to have been wholly successful, the highest legal authorities having expressed the opinion on the sufficiency of the Act of 1874 in this term as "mineral contracted to be gotten." The whole history of the development of this means of securing the fulfilment of wage contract to the workers may be compared with the history of the sections allowing piece-wage, "in any circumstances" by another person might be sworn and examined as an ordinary witness, to any person charged with any offence under the act. The result of the proceedings against workmen by the owners of the mine or any contractor, shall be filed and the manager "charged in respect of any offence committed by another person might be sworn and examined as an ordinary witness, to any person charged with any offence under the act is to be reported within twenty-one days to the inspector of the district. The powers of inspectors were extended to cover an inquiry as to the care and treatment of horses and other animals in the mine, and their control, management or direction of the mine by the manager.

An important act was passed in 1906 (Coal Mines Regulation Act 1906) limiting the hours of work for workmen below ground. It enacted that, subject to various provisions, a workman was not to be below ground in a mine for the purpose of his work, and of going to and from his work, for more than eight hours in any consecutive twenty-four hours. Exception was made in the case of those below ground for the purpose of rendering assistance in the event of an accident, or for meeting any danger, or for dealing with any emergency or work incompletely, through unforeseen circumstances, which makes it necessary to avoid serious interference in the work of the mine. The authorities of every mine must fix the times for the lowering and raising of the men to begin and be completed, and such times must be conspicuously posted at the pit head. These times must be approved by an inspector. The term "workman" in the act means any person employed in a mine below ground who is not an official of the mine (other than a fireman, examiner, or deputy), or a mechanic or a horse keeper or a person engaged solely in surveying or measuring. In the case of a fireman, examiner, deputy, onsetter, pump minder, fanman or furnace man, the maximum period for which he may be below ground is nine hours and a half. A register must be kept by the authorities of the mine of the times of descent and ascent, while the workmen may, at their own cost, station persons (whether holding the office of checkweigher or not) at the pit head, to observe the times. The authorities of the mine may extend the hours of working by one hour a day or night not more than sixty days in any calendar year (s. 3). The act may be suspended by order in council in the event of war or of imminent national danger or great emergency, or in the event of any grave economic disturbance due to the demand for coal exceeding the supply available at any time. The act came into force on the 1st of July 1909 except for the counties of Northumberland and Durham where its operation was postponed until the 1st of January 1910.

In 1905 the number of coal-mines reported was 3,126, and the number of persons employed below ground was 691,112 of whom 43,443 were under 16 years of age. Above ground, 167,261 were employed, of whom 61,645 were women and girls. The number of separate fatal accidents was 1,006, causing the loss of 1,205 lives. Of prosecutions by far the greater number were against workmen, numbering in coal and metalliferous mines 953; owners and managers were prosecuted in 72 cases, and convictions obtained in 43 cases.

Quarries.—From 1878 until 1894 open quarries (as distinct from underground quarries regulated by the Metalliferous Mines Regulation Act) were regulated only by the Factory Acts so far as they then applied. It was laid down in section 93 of the act of 1878 (41 Vict. c. 16), that "any premises or place shall not be excluded from the definition of a factory or workshop by reason only that such premises, &c., are or is in the open air," thereby overruling the decision in Kent v. Astley that quarries in which the work, as a whole, was carried on in the open air were not factories; in a schedule to the same act quarries were defined as "any place not being a mine in which persons work in getting slate, stone, coprolites or other minerals." The Factory Act of 1891 made it possible to bring these places in part under "special rules" adapted to meet the special risks and dangers of the operations carried on in them, and by order of the secretary of state they were certified, December 1892, as dangerous, and thereby subject to special rules. Until then, however, as provided by one of the inspectors of factories, quarries had been placed under the Factory Acts with the insertion of appropriate rules for their safe working, and many of them were "developed in a most dangerous manner without any regard for safety, but merely for economy," and managers of many had "scarcely seen a quarry until they became managers." In his report for 1892 it was recommended by the chief inspector of factories that quarries should be subject to the jurisdiction of the government inspectors of mines. At the same time currency was given, by the published reports of the evidence before the Royal Commission on Labour, to the wish of large numbers of quarrymen that open as well as underground quarries should come under more specialized government inspection. In 1893 a committee of experts, including inspectors of mines and of factories, was appointed by the Home Office to investigate the conditions of labour in open quarries, and in 1894 the Quaries Act brought every quarry, as defined in the Factory Act 1878, any mine which is more than 20 ft. deep, under certain of the provisions of the Metalliferous Mines Acts, and under the inspection of the inspectors appointed under those acts: further, it transferred the duty of enforcing the Factory and Workshop Acts, so far as they apply in quarries over 20 ft. deep, from the Factory to the Metalliferous Mines inspectors.

The provisions of the Metalliferous Mines Acts 1872 and 1875, applied to quarries, are those relating to payment of wages in public-houses, notice of accidents to the inspector, appointment and powers of inspectors, arbitration, coroners' inquests, special rules, penalties, certain of the definitions, and the powers of the secretary of state finally to decide disputed questions whether places come within the application of the acts. For other matters, and in particular fencing of machinery and employment of women and young persons, the Factory Acts apply, with a proviso that nothing shall prevent the employment of young persons (boys in the shift) for more than eight hours each. In 1899 it was reported by the inspectors that special rules for safety had been established in over 2000 quarries. In the reports for 1905 it was reported that the accounts of blasting accidents indicated that there was still much laxity in observance of the Special rules, and that many irregular and dangerous practices are in vogue." The absence or deficiency of external fencing to a quarry dangerous to the public has been since 1887 (50 & 51 Vict. c. 19) deemed a nuisance liable to be dealt with summarily in the manner provided by the Public Health Act 1875.

In 1905, 94,819 persons were employed, of whom 59,978 worked inside the actual pits or excavations, and 34,841 outside. Compared with 1900, there was a total increase of 924 in the number of persons employed. Fatal accidents resulted in 1900 in 127 deaths; compared with 1899 there was an increase of 10 in the number of deaths, and, as Professor Le Neve Foster pointed out, this exceeded the average death-rate of underground workers at mines under the Coal Mines Acts during the previous ten years, in spite of the question "having
nothing to fear from explosions of gas, underground fires or inundations." He attributed the difference to a lax observance of precautions which might in time be remedied by stringent administration of the law. In 1903 there were 97 fatal accidents resulting in 99 deaths. In 1900 there were 95 prosecutions against owners or agents, with 67 convictions, and 13 convictions of workers, with 12 convictions, and in 1903 there were 45 prosecutions of owners or agents with 43 convictions and 9 prosecutions of workmen with 5 convictions.

In 1883 a short act extended to all "workmen" who are manual labourers other than miners, with the exception of domestic or menial servants, the prohibition of payment of wages in public-houses, beer-shops and other places for the sale of intoxicating or fermented liquor, laid down in the Mines Regulations and Metalliferous Mines Regulation Acts. The places covered by the prohibition include any office, garden or place belonging to, or occupied with the places named, but the act does not apply to such wages as are paid by the resident, owner or occupier of the public-house, beer-shop and other places included in the prohibition to any workman bona fide employed by him. The penalty for an offence against this act is one not exceeding £10 (compare the limit of £5 for the corresponding offence under the Coal Mines Act), and all offences may be prosecuted and penalties recovered in England and Scotland under the Summary Jurisdiction Acts. The act does not apply to Ireland, and no special inspectorate is charged with the duty of enforcing its provisions.

**Shop Hours.**—In four brief acts, 1829 to 1899, still in force, the first very limited steps were taken towards the positive regulation of hours of work for shop assistants. Of the Acts of 1899 certain additional optional powers were given to any local authority making a "closing order" fixing the hour (not earlier than 7 p.m. or on one day in the week 1 p.m.) at which shops shall cease to serve customers throughout the area of the authority or any specified part thereof as regards all shops or as regards any specified class of shops. Before such an order can be made (1) a prima facie case for it must appear to the local authority; (2) the local authority must inquire and agree; (3) the order must be drafted and sent for confirmation or otherwise to the central authority, that is, the secretary of state for the Home Department; (4) the order must be laid before both Houses of Parliament. The Home Office has given every encouragement to the making of such orders, but their number in England is very small, and the act is practically inoperative in London and many large towns where the need is greatest. As the secretary of state pointed out in the House of Commons on the 1st of May 1907, the local authorities have not taken enough initiative, but at the same time there is a great difficulty for them in obtaining the required two-thirds majority, among occupiers of shops, in the requisite number of hours. Therefore, the Act and at the same time shop assistants have no power to set the law in motion. In England 364 local authorities have taken no steps, but in Scotland rather better results have been obtained. The House resolved, on the date named, that more drastic legislation is required. As regards shops, therefore, in place of such general codes as apply to factories, laundries, mines—only three kinds of protective requirement are binding on employers of shop assistants: (1) Limitation of the weekly total of hours of work of persons under eighteen years of age to seventy-four inclusive of meal-times; (2) prohibition of the employment of such persons in a shop on the same day that they have, to the knowledge of the employer, been employed in any factory or workshop for a longer period than would, in both classes of employment together, amount to the number of hours permitted to such persons in a factory or workshop; (3) provision for the supply of seats by the employer, in all rooms of a shop or other premises where goods are retailed to the public, for the use of female assistants employed in retailing the goods in the shop, and a proportion of one in every three female assistants. The first two requirements are contained in the act of 1892, which also prescribed that a notice, referring to the provisions of the act, and stating the number of hours in the week during which a young person may be lawfully employed in the shop, shall be kept exhibited by the employer; the third requirement was first provided by the act of 1899. The intervening acts of 1893 and 1895 are merely supplementary to the act of 1892; the former providing for the salaries and expenses of the inspectors which the council of any county or
forbid, agree or implied, between employer and workmen as to the manner or place in which, or articles on which, a workman shall expend his wages, or for the deduction from wages of the price of articles (other than materials to be used in the labour of the workmen) supplied by the employer.

The act of 1887 added a further prohibition by making it illegal for an employer to charge interest on any advance of wages, "whenever by agreement, custom, or otherwise a workman is entitled to receive in anticipation of the regular period of the payment of his wages an advance as part or on account thereof."

Further, it strengthened the section of the principal act which provided that no employer shall have any action against his workman for goods supplied at any shop belonging to the employer, or in which the employer is interested, by (a) securing any workman suing an employer for wages against any counter-claim in respect of goods supplied to the workman by any person under any order or direction of the employer, and (b) by expressly prohibiting an employer from dismissing any worker on account of any particular time, place or manner of expending his wages.

Certain exemptions to the prohibition of payment of wages otherwise than in coin were provided for in the act of 1887. If a workman was paid in kind, the value of the kind supplied by the worker, viz., rent, victuals and consumed under the employer's roof, medicine, fuel, provender for beasts of burden used in the trade, materials and tools for use by miners, advances for friendly societies or savings banks; in the case of fuel, provender and tools there was also a proviso that the charge should not exceed the real and true value.

The act of 1887 amended these provisions by requiring a correct annual audit of the accounts of deduction for wages paid, or by permitting part payment of servants in husbandry in food, drink (not intoxicants) or other allowances, and by prohibiting any deductions for sharpening or repairing workmen's tools except by agreement not forming part of the condition of hiring.

Two important administrative amendments were made by the act of 1887: (1) a section similar to that in the Factory and Mines Acts was added, empowering the employer to exempt himself from penalty for contravention of the acts on proof that any other person was the actual offender and of his own due diligence in reporting the execution of the acts; (2) the duty of enforcing the acts in factories, workshops, and mines was imposed upon the inspectors of the Factory and Mines Departments, respectively, of the Home, and to their task they were empowered to bring all the authorities and powers which they possessed in virtue of the acts under which they are appointed; these inspectors thus prosecute defaulting employers and recover penalties under the Summary Jurisdiction Acts, but they do not undertake civil proceedings for improper deductions or payments, proceedings for which would lie with workmen under the Employers and Workmen Act 1875.

Persons benefited by Truck Acts.

The law thus in certain circumstances covers workmen for a contractor or sub-contractor. A decision of the High Court at Dublin in 1900 (Squire v. Sweeney) strengthened the inspectors in investigation of offences committed amongst workmen by supporting the contention that inquiry and exercise of all the powers of an inspector could legally take place in part of an employer's premises other than those in which the work is given out. It defined for Ireland, in a narrower sense than had hitherto been understood and acted upon by the Factory Department, the classes of workmen protected, by deciding that only such as were under a contract personally binding made by the employer were really to be regarded as workmen; and the decision was similarly declared in the decided cases of Squire v. The Midland Lace Co. The judges (Lord Alverstone, C.J.; and Kennedy and Ridley, J.J.) stated that they came to the conclusion with "reluctance," and said: "We venture to express the hope that some amendment of the law may be made so as to extend the protection of the Truck Act to a class of workpeople indistinguishable from those already within its provisions."

The workers in question were lace-clippers taking out work to do in their homes, and in the words of the High Court decision "though they do sometimes employ assistants are evidently, as a class, wage-earning manual labourers and not contractors in the ordinary and popular sense." The principle relied on in the decision was that in the case of Ingram v. Barnes.

At the time of the passing of the act of 1887 it seems to have been generally believed that the obligation under the principal act to pay the same amount of wages earned in coin for any wages of the same amount was illegal any deductions from wages in respect of fines, "meaning:"

Important decisions in 1888 and 1890 showed this belief to have been ill-founded. The essential point lies in the definition of "fines of imprisonment" in the Truck Acts, which is the employment of labour, which implies not necessarily any general obligation in respect of employment between employer and workmen where there is a contract to perform a certain piece of work, but that part of it, the real net wage, which the workman was to get as his recompense for the labour performed. As the contract became clearer, the obligation became clearer as well, and as payments by workers for materials used in the work were not illegal, and that deductions or payments by way of compensation to employers or by way of discipline might legally (with the single exception made by the Obsession Act, through which prohibited by the Employers and Workmen Act 1875) exceed the degree of loss, this kind of damage to the employer, it also came clearly into view that further legislation was desirable to extend the principles of the Truck Acts to the whole class of workmen, to stop any unfair dealing that may be encouraged by half-defined custom in work-places, on the part of the employer in making a contract, while at the same time leaving the principle of freedom of contract as far as possible untouched. The Truck Act of 1896 regulates the conditions under which deductions can be made by or payments made to the employer, out of the "sum contract to be paid to the worker," i.e. out of any wages, profits, or contract of a workman. It makes such deductions or payments illegal unless they are in pursuance of a contract; and it provides that deductions (or payments) for (a) fines, (b) bad work and damaged goods, (c) materials, and (d) losses caused by the workman in employment in relation to the work shall be reasonable, and that particular of the name in writing shall be given to the workman. In none of the cases mentioned is the employer to make any profit; neither by fines, for they may only be imposed in respect of acts or omissions which cause, or are likely to cause, injury to the employer, and, in the case of the price may not exceed the cost to the employer; nor by deductions or payments for damage, for these may not exceed the actual or estimated loss to the employer. Fines and charges for damage must be formalised in the contract. This is the "whole of the case," and no contract could make legal a fine which a court held to be unfair to the worker in the sense of the act. The contract between the employer and workman must either be in writing signed by the workman, or its terms must be clearly stated in a notice constantly affixed in a place easily accessible to the workman to whom, if a party to the contract, a copy shall be given at the time of making the contract, and who shall be entitled, on request, to obtain from the employer a copy of the whole of the contract. If, on each occasion when a deduction or payment is made, full particulars in writing must be supplied to the workman. The employer is bound to keep a register of deductions or payments, and to enter therein particulars of any such payments. This register must have been included under the earlier Truck Acts; the sections relating to fines apply also to shop assistants. The latter, however, are apparently left to enforce the provisions of the law themselves, as no inspectorate is empowered to intervene on their behalf. In these and other cases a procurer, i.e. a person who gathers work for another, is also a person.

Any workman or shop assistant may recover any sum deducted by or paid to his employer contrary to the act of 1896, provided that proceedings are commenced within six months, and that where he has recovered the excess over the amount which the court may find to have been fair and reasonable in all the circumstances of the case. It is expressly declared in the act that nothing in it shall affect the provisions
of the Coal Mines Act with reference to payment by weight, or legalize any deductions, from payments made, in pursuance of those provisions. The powers and duties of inspectors are extended to cover the case of a laundry, and of any place where work is given out by the piece to be performed in the house by a workman or a family or an employer, or contractor. Power is reserved for the secretary of state to exempt by order specified trades or branches of them in specified areas from the provisions of the act of 1866, if he is satisfied that they are unnecessary to the general health and freedom of the community of the Lancashire cotton industry. The effect of the exemption is not to prevent fines and deductions from being made, but the desire for it demonstrated that there are cases where leaders among workers have felt compelled to make their own terms on their own lines without the specific conditions laid down in this act. The reports of the inspectors of factories have demonstrated that in other industries, and those requiring a high degree of skill, the working class is held to be a self-supporting one of a highly technical character to be gradually acquired, before opinions could be formed as to the reasonableness and fairness, or the contrary, of many forms of deduction. Owing partly to difficulties of legal interpretation involving the necessity of taking test cases into court, partly to the margin for differences of opinion as to what constitutes "reasonableness" in a deduction, the average number of convictions obtained on prosecutions is not so high as under the Factory Acts, though the average penalty imposed is higher. In 1905, 81 cases were taken into court resulting in 34 convictions with an average penalty of £1, 10s.

Reference should be here made to the Shop Clubs Act 1902 as closely allied with some of the provisions of the Truck Acts by its provision that employers shall not make it a condition of employment that an employee shall become a member of a shop club unless it is registered under the Friendly Societies Act 1896. In the case of payment of wages in Public Houses Act, no special inspector has the duty of enforcing this act.

III. Continental Europe

In comparing legislation affecting factories, mines, shops and truck in the chief industrial countries of the continent with that of Great Britain, it is essential to a just view that inquiry should be extended beyond the codes themselves to the general social order and system of law and administration in each country. Further, special comparison of the definitions and the sanctions of each industrial code must be recognized as necessary, for these vary in all. In so brief a summary as is appended here no more is possible than an outline indication of the main general requirements and prohibitions of the laws as regards: (1) hours and times of employment, (2) ordinary sanitation, and special requirements for unhealthy and dangerous industries, (3) security against accidents, (4) payment of wages, and (5) control of wages and prices.

As regards the first of these subdivisions, in general in Europe the ordinary legal limit is rather wider than in Great Britain, being in several countries not less than 11 hours a day, and while in some, as in France, the normal limit is 10 hours daily, yet the administrative discretion in granting exceptions is rather more elastic. The weekly half-holiday is a peculiarly British institution. On the other hand, in several European countries, notably France, Austria, Switzerland, and Russia, the legal maximum day applies to adult as well as youthful labour, and not only to specially protected classes of persons. As regards specialized sanitation for unhealthy factories, German regulations appear to be most nearly comparable with British. Mines' labour regulation in several countries, having an entirely different origin linked with ownership of mines, is only in few and most recent developments seen in the factory legislation of Great Britain and Minus. In Germany, treating this matter as an integral part of her imperial industrial code, has advanced farther than has Great Britain. In truck legislation most European countries (with the exception of France) appear to have been influenced by the far earlier laws of Great Britain, although in some respects Belgium, with her rapid and recent industrial development, has made interesting original experiments. The rule of Sunday rest (see Sunday) has been extended in several countries, most recently in Belgium and Spain. In France this partially attempted rule has been so modified as to be practically a seventh day rest, not necessarily Sunday.
or educational character are included. The persons protected are girls and women under 21 years, and boys under 16; and women over 21 only find a place in the law through the prohibition of their employment within four weeks after childbirth. As the hours of labour are not limited for certain occupations, the hours of boys from 16 to 21. The law of Sunday rest dated the 17th of July 1895, however, applies to labour generally in all industrial and commercial undertakings except transport and fisheries, with certain regulated exceptions for (a) work of a reason of urgency, (b) repairs and cleaning, (c) retail food supply. Young workers are excluded from the exceptions. The absolute prohibitions of employment are: for children under 12 years in any industry, manufactured or mining or transport, and for work within or below the surface in working of mines. Boys under 16 years and women and girls under 21 years may in general not be employed before 5 A.M. or after 9 P.M., and one day in the seven is to be set aside for an employer who to these rules of employment shall be made either by royal decree for classes or groups of processes, or by local authorities in exceptional cases. The exceptions may be applied, generally, only to workers over 14 years, but in mines, by royal decree, the working hours not exceeding 12 hours. The law of 1896 fixes only a maximum of 12 hours of effective work, to be interrupted by pauses for rest of not less than 1½ hours, empowering the king by decree to formulate more precise limits suited to the special circumstances of individual industries. Royal decrees have accordingly laid down the conditions for many groups, including textile trades, manufacture of paper, pottery, glass, clothing, mines, quarries, engineering and printing works. In some the daily limit is 10 hours, in certain others it is 12 hours or more. For healthy trades, such as the manufacture of Lucifer matches, vulcanization of india-rubber by means of carbon bi-sulphide, the age of exclusion from employment has been raised, and in the last-named occupations the age limit is 18 years. The law of 1901, which since 1896 has been more fully developed, also applies to child employment of persons under 16 years in fur-pulling and in carotting of rabbit skins, and another of the 13th of May 1905 regulates use of lead in house-painting. In 1896 a law was passed to enable the authority of cantonal inspectorate to enter mines, workshops, and employment of persons under 16 years in fur-pulling and in carotting of rabbit skins. The law of 1896 gives the right to enter workplaces of mining and of workshops with textile workers. The law of 1898 is not all that is necessary in the way of health regulation, as the safety of women is not in every respect provided for. Safety in mines (which are not private property, but state concessions to be worked under strict state control) has been provided for since 1816. In matters of hygiene, until 1899 the powers of the public administration were limited to the import and the notification of manufacture of substances dangerous to health, and the position of employment, of the hours of work, etc. The law of 1899 has passed authorizing the government to make regulations for every kind of risk in any undertaking, whether classed under the law of public health or not. By a special law of 1898 children and young persons are protected in respect of special laws or regulations concerning hours of work, wages, etc. in factories and workshops. Similarly, the law of 1899 applies to all classes of workers engaged in public, private or domestic service, of wages in legal tender, to prohibit payment of wages in public-houses, and to secure prompt payment of wages. Certain deductions were permitted under careful control for special objects, provided the wages of younger children are paid. A royal order of the 11th of October 1903 required use of automatic indicators for estimating wages in certain cases in textile processes. The law of the 15th of June 1896 regulates the affixing in workshops, mines, factories, etc. of a plate setting out the working hours, the nature and rate of fines, if any, and the mode of their application. Two central services the mine inspectorate and the factory and workshop inspectorate, divide the duties indicated. A system of admission to and examinations of regulations relating to industries classed as unhealthy, but the tendency has been to give the supreme control in these matters to the factory service, with its expert staff.

Holand.—The first law for regulation of labour in manufacture was promulgated in 1855 in order to limit only to employment of children. The basis of all existing regulations was established in the law of the 5th of May 1889, which applies to all industrial undertakings, including agriculture and forestry, fishing, stock-rearing. Employment of young persons between the ages of 11 and 18 years must not exceed 1½ hours, and for women of any age, these protected persons may be excluded by royal decree from unhealthy industries, and such industries are specified in a decree of 1889 which lays down that women must not exceed 11 in the 24, and at least one hour for rest must be given before 11 A.M. and 3 P.M., which hour must not be spent in a workroom. Work before 5 A.M. or after 7 P.M. Sunday work, and work on recognized holidays is generally prohibited, but there are exceptions. Overtime from 7 to 10 P.M., under conditions, is allowed for women and young workers, and Sunday work for women, for example, in butter and cheese making, and night work for boys over 14 in certain industries. Employment of women within four weeks of childbirth is prohibited. Notices of working hours must be affixed in workplaces. Underground work in mines is prohibited for young persons of both sexes, and for women under 18, except in the small industry. In 1895 the first legislative provision was made for protection of workers against risk of accident or special injury to health. Sufficient cubic space, lighting, ventilation, sanitary accommodation, and equipment of workshops and of individual workmen in respect of the removal of noxious gases or dust, fencing of machinery, precautions in cases of fire, and other matters are provided for. The manufacture of Lucifer matches by means of white phosphorus was forbidden and the export, importation and sale was regulated by a law of the 28th of May 1901. By a law of 1901, the employment of young women and young workers were strengthened in processes in which lead compounds or other poisons are used, and their employment at certain dangerous machines and in cleaning machinery or chemical workshops is prohibited. Nothing hitherto found in Holland exists in Holland, but possibly abuses of the system are prevented by the existence of industrial councils representing both employers and workers, with powers to mediate or arbitrate in case of disputes.

Switzerland.—In Switzerland separate cantonal legislation prepared the way for the general Federal labour law of 1877 on which subsequent legislation rests. Such legislation is also cantonal as in England and France, and is subject to the same interpretation of the principles contained in the law of 1877, whereas cantonal legislation covers industries not included under the Federal law, e.g., single workers employed in a trade (métier) and employment of girls under 16 years. For example, in Zürich cantonal law limits the number of girls in workshops employing young persons under 18 or more than 10 workers, and workshops in which unhealthy or dangerous processes are carried on. Mines are not included, but are regulated in some respects. The federal law does not apply to the mining industry. The Law of Employers' Liability 1881–1887, which requires in all industries precautions against accidents and reports of all serious accidents to the cantonal governments, applies to mines. This led, in 1888, to the creation of a special mining department, and mines, of which there are few, have a special inspection. Since 1890, employers of a specified number of workers, generally employing girls, or those engaged in certain trades, or in work so dangerous that accidents must be prevented, must have a person trained in medical science among their workmen. A law of 1897 has extended the provisions of the mining law to all industries engaged in mining, and applies the Law of Employers' Liability 1881–1887, which in turn applies to mining. Safety regulations and fencing of machinery are provided for with considerable minuteness in a Federal decree of 1897. The plans of safety regulations and fencing of machinery must be submitted to the Federal government. In the case of the Lucifer match factories, not the building but methods of manufacture must be submitted. Since 1901 the manufacture, sale and import of matches containing white phosphorus are prohibited. A law of 1901 also prohibits the employment of young persons under 18 years in mining during eight weeks before and after childbirth. Certain dangerous occupations, e.g., where lead or lead compounds are in use, women may not legally be employed during pregnancy. A resolution of the federal council in 1898 classifying for different substances in use industries, industries, and laid down the definition of "an unhealthy industry. Illness of workers directly caused by use of any of these substances the liability provided by article 3 of the law of the 25th of June 1881, and article 1 of the law of the 26th of April 1897, should apply to the mining industry. The Federal Labour Law 1877 generally prohibits payment of wages on account of accidents, and, with the introduction of accident insurance, no deduction shall be made without an express contract. Some of the cantonal laws go much farther than the British act of 1896 in prohibiting certain deductions; e.g., Zürich prohibits any charge for repairs in cases of accident or injury in workshops or machinery. By the Federal law fines may not exceed half a day's wage. Administration of the Labour laws is divided between inspectors appointed by the Federal Government and local authorities, under supervision of the cantonal government. The Federal Government forms a court of appeal against decisions of the cantonal governments.
Germany.—Regulation of the conditions of labour in industry throughout the German empire is provided for in the Imperial Industrial Code and the orders of the Federal Council based thereon. By far the most important recent amendment socially is the law regulating child labour passed at the 39th of March, which confers upon establishments having industrial character in the sense of the Industrial Code. This Code is based on earlier industrial codes of the separate states, but more especially on the Code of 1869 of the North German Confederation. The Code provides for the regulation of trades and industrial occupations, except transport, fisheries, and agriculture. Mines are only included so far as truck, Sunday and holiday rest, prohibition of employment underground of female labour, limitation of the hours of women and young workers are concerned. The Code, according to the provisions of the mining laws, also limited hours of miners. Sunday rest was, in 1891, secured for every class of workers, commercial, industrial, and mining. Annual holidays were also secured on church festivals.

The Code is applicable to exceptions under conditions. An important distinction has to be made between the regulations for hours and times of labour for protected persons (women, young persons and children). Setting aside for the moment hours of shop assistants (which are under special sections since 1900), it is seen that these limits apply for the most part only to industrial workers for whom the working day endangers the health of the worker (R.G.O. § 120). Previously application had been made of powers to reduce the working day in such unhealthy industries as silting of mirrors by mercury and dyeing of clothes. One of the effects of these measures is that the considerable powers vested in administration of initiating regulations. The Industrial Code expressly retains power for the states to initiate certain additions or exceptions to the Code which in any given case may form part of the law regulating factories there. The Code (unlike the Austrian Industrial Code) lays down no general limit for a normal working day for adult male workers, but since 1891 full powers were given to the Imperial government to limit hours for any class of workers in industries where employment endangers the health of the worker.

work. Sunday rest must begin not later than 6 A.M., and must be of 24 hours' duration. These last two provisions do not hold in case of pressing danger for safety, health, or property. Sickness and accident funds and mining associations are legislated for in minutest detail. The sanitary conditions of mines, the introduction of air-pumps and ventilating machinery in motion; (e) during six weeks after childbirth, unless provided with a medical certificate stating that she might return at the end of four weeks without injury to health; (f) in dangerous mine shafts and excavations, and in the case of miners. Further, work on Sundays and public holidays is prohibited to all workers, adult and youthful, with conditional exceptions under the authority of the inspectors. Children over 12 are admitted to industrial work on obtaining certificates of their physical constitution and of elementary education. The hours of children are limited to 6, with pauses, and of young persons (of 14 to 18 years) to 10, with pauses. Night work between 8 P.M. and 6 A.M. is prohibited. All workers shall be entitled to a copy of a code of rules regulating their work. The terms of the contract of work drawn up by representatives of employees with the employers and sanctioned by the inspector. Health and safety in working are provided for in detail in the same law. Special rules and orders for the safety of workers in factories and workshops, and for the prevention of accidents. The code of the law is based on the 1892 law, the 1899 law, and the 1901 law. Special provision is made for the protection of children under 12 years of age, those under 15 years of age in factories and workshops, and children under 16 years of age in workshops and mines. The law of 1886 prohibits employment of children under 9 years of age in industry and under 10 years of age in underground mining. Night work for women was in Italy first prohibited by the law of the 10th of June 1902, and at the same time also for boys under 15, but this regulation was not altogether effective. Further, the law of 1902, which made it obligatory to employ a woman, prohibited by the same law persons under 15 and women of any age were accorded the claim to one day's complete rest of 24 hours in the week; the age of employment of children in factories, workshops, and workshops for the handicrafts was increased by the law of 13th of March 1900, the latter by the law of the 16th of June 1902, forbid the employment of women within a fixed period of childbirth; in Spain the limit is three weeks, in Italy one month, which is not yet fully in force. The law of 1901, which makes Sunday rest's secured in industrial works, with regulated exceptions in Spain by the law of the 3rd of March 1904. It is in the direction of fencing and other safeguards against accidents and regards sanitary provisions, both in industrial workplaces and in mines, that Italy has made most advance since her law of 1890 for prevention of accidents. Special measures for prevention of malaria are required in cultivation of rice by a ministerial circular of the 23rd of April 1901. Work may not be continued beyond 3 p.m. on Sunday; children under 13 may not be employed in this industry. (A. M. An.).

IV. United States.

Under the general head of Labour Legislation all American statute laws regulating labour, its conditions, and the relation of employer and employee must be classed. It includes what is properly known as factory legislation. Labour legislation belongs to the latter half of the 19th century, so far as the United States is concerned. Like England in the far past, the Americans in colonial days undertook to regulate wages and prices, and later the employment of apprentices. Legislation relating to wages and prices was long abandoned, but the laws affecting the employment of apprentices still exist in some form, although conditions of employment have changed so materially that apprenticeships are not entered as of old; but the laws regulating the employment of apprentices were the basis on which English legislation found a foothold when parliament wished to regulate the labour of factory operatives. The code of labour laws of the present time is also largely the result of the industrial revolution during the latter part of the 19th century, under which the domestic or hand-labour system was displaced through the introduction of power machinery. As this revolution took place in the United States at a somewhat later date than in England, the labour legislation necessitated by it belongs to a later date. The factory, so far as textiles are concerned, was firmly established in America during the period from 1820 to 1840, and it was natural that the English legislation found friends and advocates in the United States, although the more objectionable conditions accompanying the English factory were not to be found there.

The first attempt to secure legislation regulating factory employment related to the hours of labour, which were very long—twelve to thirteen hours a day. As machinery was introduced it was felt that the tension resulting from speeded machinery and the close attention required made feasible the introduction of a shorter work-day. This view took firm hold of the operatives, and was the chief cause of the agitation which has resulted in a great body of laws applying in very many directions. As early as 1806 the canneliers and shipbuilders of New York City agitated for a reduction of hours to ten per day, but no legislation followed. There were several other attempts to secure some regulation relative to hours, but there was no general agitation prior to 1831. As machinery was the state which first recognized the necessity of regulating employment (following in a measure, and so far as conditions demanded, the English labour or factory legislation), the history of such legislation in that state is indicative of that in the United States, and as it would be impossible in this article to give a detailed history of the origin of laws in the different states, the dates of their enactment, and their provisions, it is best to follow primarily the course of the Eastern states, and especially that of Massachusetts, where the first general agitation
took place and the first laws were enacted. That state in 1836
regulated by law the question of the education of young persons
employed in manufacturing establishments. The regulation of
hours of labour was warmly discussed in 1832, and several
committees and commissions reported upon it, but no
specific action on the general question of hours of labour secured
the indorsement of the Massachusetts legislature until 1874,
although the day's labour of children under twelve years of age
was limited to ten hours in 1842. Ten hours constituted a day's
labour, on a voluntary basis, in many trades in Massachusetts
and other parts of the country as early as 1833, while in the
shipbuilding trades this was the work-day in 1844. In April
1840 President Van Buren issued an order "that all public
establishments will hereafter be regulated, as to working hours,
by the ten-hours system." The real aggressive movement began
in 1845, through numerous petitions to the Massachusetts
legislature urging a reduction of the day's labour to eleven hours,
but nothing came of these petitions at that time. Again, in 1850,
a similar effort was made, and also in 1851 and 1853, but the bills
failed. Then there was a period of quiet until 1865, when an
unpaid commission made a report relative to the hours of labour,
and recommended the establishment of a bureau of statistics
for the purpose of collecting data bearing upon the labour
question. This was the first step in this direction in any country.
The first bureau of the kind was established in Massachusetts in
1860, but meanwhile, in accordance with reports of commissions
and the address of Governor Bullock in 1866, and the general
sentiment which then prevailed, the legislature passed an act
regulating in a measure the conditions of the employment of
children in manufacturing establishments; and this is one of
the first laws of the kind in the United States, although the first
legislation in the United States relating to the hours of labour
which the writer has been able to find, and for which he can fix
a date, was enacted by the state of Pennsylvania in 1849, the law
providing that ten hours should be a day's work in cotton,
wollen, paper, bagging, silk and flax factories.

The Massachusetts law of 1866 provided, firstly, that no child
under ten should be employed in any manufacturing estab-
ishment, and that no child between ten and fourteen
should be so employed unless he had attended some
public or private school at least six months during the
year preceding such employment, and, further, that
such employment should not continue unless the child attended
school at least six months in each and every year; secondly,
the penalty not exceeding $50 for every owner or agent or other person
knowingly employing a child in violation of the act; thirdly,
that no child under the age of fourteen should be employed in any
manufacturing establishment more than eight hours in any one
day; fourthly, that any parent or guardian allowing or consent-
ing to employment in violation of the act should forfeit a sum
not to exceed $50 for each offence; fifthly, that the Governor
instruct the state constable and his deputies to enforce the
provisions of all laws for regulating the employment of children
in manufacturing establishments. The same legislation also
created a commission of three persons whose
functions were to investigate the subject of hours of labour in relation to the
social, educational and sanitary condition of the working classes.

In 1867 a fundamental law relating to schooling and hours of
labour of children employed in manufacturing and mechanical
establishments was passed by the Massachusetts legislature.
It differed from the act of the year previous in some respects,
going deeper into the general question. It provided that
no child under ten should be employed in any manufacturing or
mechanical establishment of the commonwealth, and that no
child between ten and fifteen should be so employed unless he
had attended school, public or private, at least three months
during the year next preceding his employment. There were
provisions relating to residence, &c., and a further provision that
no time less than 120 half-days of actual schooling should be
deemed an equivalent of three months, and that no child under
fifteen should be employed in any manufacturing or mechanical
establishment more than sixty hours any one week. The law
also provided penalties for violation. It repealed the act
of 1866.

In 1869 began the establishment of that chain of offices in the
United States, the principle of which has been adopted by other
countries, known as bureaus of statistics of labour,
their especial purpose being the collection and dissemination
of information relating to all features of industrial employment.
As a result of the success of the first bureau, bureaus are in
existence in thirty-three states, in addition to the United States
Bureau of Labour.

A special piece of legislation which belongs to the common-
wealth of Massachusetts, so far as experience shows, was that
in 1872, providing for cheap morning and evening trains for the
accommodation of working men living in the vicinity of Boston.
Great Britain had long had such trains, which were called
parliamentary trains. Under the Massachusetts law some of the
railways running out of Boston furnished the accommodation
required, and the system has since been in operation.

In different parts of the country the agitation to secure legisla-
tion regulating the hours of labour became aggressive again in
1874. The Factory Act, 1867, having being a constant repetition of attempts to secure the
enactment of a ten-hours law, but in Massachusetts all the petitions failed until 1874, when the legislature of
that Commonwealth established the hours of labour at sixty per
week not only for children under eighteen, but for women, the
law providing that no minor under eighteen and no woman over
that age should be employed by any person, firm or corporation
in any manufacturing establishment more than ten hours in any
one day. In 1876 Massachusetts reconstructed its laws relating
to the employment of children, although it did not abrogate the
principles involved in earlier legislation, while in 1877 the
commonwealth passed Factory Acts covering the general
provisions of the British laws. It provided for the general inspection
of factories and public buildings, the provisions of the law
relating to dangerous machinery, such as belting, shafting, gear-
ing, drums, &c., which the legislature insisted must be securely
guarded, and that no machinery other than steam engines should
be charged with running. The question of ventilation and cleanliness was also attended to. Dangers connected
with hoistways, elevators and well- holes were minimized by their
protection by sufficient trap-doors, while fire-escapes were made
obligatory on all establishments of three or more storeys in
height. All main doors, both inside and outside, of manufactur-
ing establishments, as well as those of churches, school-rooms,
town halls, theatres and every building used for public assemblies,
should open outwardly whenever the factory inspectors of the
commonwealth deemed it necessary. These provisions remain
in the laws of Massachusetts, and other states have found it wise
to follow them.

The labour legislation in force in 1910 in the various states of the
Union might be classified in two general branches: (A) protective
laws regulating hours of labour, or laws for the protection of children's
and women's health, which, while not of the same
\(\text{inspect} \) act, are designed to prevent or correct the
\(\text{false} \) hours; (B) laws to prevent child labour,
and other branches of state and federal laws relating to
child labour.

(A) The first class includes factory and workshop acts, laws
relating to hours of labour, or laws for the protection of
children's health, and laws regulating the employment of
women. The laws of these states have been
enacted in five main groups--first, laws which relate to
the working hours of children under fifteen; second,
laws which relate to the working hours of children
and women, and certain classes of manual labour;
third, laws relating to the working conditions of
factory inspectors, whose duties it is to enforce these
laws and to protect the rights of children employed
in factories; fourth, laws relating to the working
hours of women; and last, laws for the protection of
children employed under certain conditions, such as
those employed in mines, in the manufacture of
munitions, &c.

The most common provisions of the factory acts in the various
states are those by which a minimum age of ten years is fixed
below which employment is unlawful. In all but
five states have enacted such provisions, and these five states have
practically no manufacturing industries. In some states the
laws fixing an age limit are restricted in their application to factories,
while in others they extend also to workshops, bakeries, mercantile

25
establishments and other work places where children are employed. The prescribed age limit varies from ten to fourteen years. Provisions concerning the education of children in factories and workshops may be considered. Provisions relating to apprenticeship and those requiring a certain educational preparation or apprenticeship are an important feature of the law. Apprenticeship laws are numerous, but they do not generally now have great force, because of the practical.abolition of the apprenticeship system in recent years. The operation of modern methods of production. Most states now have laws enacted under a specified age, usually sixteen, from being employed in factories and workshops. The provisions of the factory acts relating to apprenticeship generally affect only the employment of young men and women. The landlord and owner of the shop or store have enacted such provisions, those limiting the hours of work of children occurring frequently than those limiting the hours of women. The hour (or day) of the public holidays ranges from six to sixty-six per week. Where the working conditions for women and children are especially laborious, the minimum age for girls is fourteen years. In some cases the restrictions of the hours of work of women and children are more general, while in others it applies only to employment of women in the clothing trades. In the states where the provisions have been made for the protection of children, the minimum age is fourteen years. Where the working conditions for women and children are specially laborious, the minimum age prescribed is fourteen years. In these states, where the operation of factories and workshops is such that the employment of women and girls is especially laborious, the provisions of the law concerning the hours of work are similar to those for women. The hours of work are similar to those for women. The law makes the following provisions for the protection of women and girls employed in factories and workshops:

1. The hours of work are limited to ten hours per day and six days per week.
2. The day's work is limited to twelve hours per week.
3. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
4. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
5. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
6. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
7. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
8. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
9. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.
10. The law provides that women and girls employed in factories and workshops shall be required to work no more than ten hours per day, or six hours per day, or six days per week.

Sources:

very few have availed themselves of this privilege. A number of the states have enacted laws tending to give special protection to and encourage trade unions. Thus, nearly one-half of the states have passed acts declaring it unlawful for employers to discharge workmen for joining labour organizations, or to make it a condition of employment that they shall not belong to such bodies. Laws of this kind have generally been held to be unconstitutional. Nearly all the states have laws protecting trade unions in the use of the union label, insignia of membership, credentials, &c., and making it a misdemeanour to counterfeit or fraudulently use them. A number of the states exempt labour organizations from the operations of the anti-trust and insurance acts.

Until recent years all legal action concerning labour disturbances was based upon the principles of the common law. Some of the states have now fairly complete statutory enactments concerning labour disturbances, while other states have little or no legislation of this class. The right of employees to strike for any cause or for no cause is sustained by the common law everywhere in the United States. Likewise an employer has a right to discharge any or all of his employees when they have no contract with him, and he may refuse to employ any person or class of persons for any reason or for no reason. Agreements among strikers to take peacable means to induce others to remain away from the works of an employer until he yields to the demands of the strikers are not held to be conspiracies under the common law, and the carrying out of such a purpose by peacable persuasion and without violence, intimidation or threats, is not unlawful. However, any interference with the constitutional rights of another to employ whom he chooses or to labour when, where or on what terms he pleases, is illegal. The boycott has been held to be an illegal conspiracy in restraint of trade. The statute in all the various states concerning labour disturbances refers to rules, regulations, or laws in part or in whole, and in part or less departures from or additions to the established principles. The list of such statutory enactments is a large one, and includes rules relating to blacklisting, boycotting, conspiracy against working-men, interference with employment, intimidation, picketing and strikes of railway employees; laws requiring statements of causes of discharge of employees and notice of strikes in advertisements for labour; laws prohibiting deception in the employment of labour and the hiring of armed guards by employers; and laws declaring that certain labour agreements do not constitute conspiracy. Some of these laws have been held to be unconstitutional, and some have not yet been tested in the courts.

The laws just treated relate almost entirely to acts either of employers or of employees, but there is another form of law, namely, that providing for action to be taken by others in the effort to prevent wrongs or violations of the rights of employers or employees by their own acts or by those of their employers, or to settle any differences which arise out of controversies relating to wages, hours of labour, terms and conditions of employment, the payment of wages and other matters, the arbitration of labour disputes (see Arbitration and Conciliation). Twenty-three states and the Federal government have laws or constitutional provisions of this nature. In some cases they provide for mediation and state or special boards, for arbitration by the parties themselves, and for the appointment of special boards or commissions to decide disputes, either in whole or in part, and in some cases for the determination of disputes by the state or federal government. These boards are usually authorized to hear and decide disputes upon the application of both parties. An agreement to maintain the status quo pending arbitration is usually required. The modes of enforcing obedience to the awards of the boards are various. They depend upon publicity alone, some give the decisions the effect of judgments of courts of law which may be enforced by execution, while in other states a provision to such decisions is punishable as for contempt of court. The Federal statute applies only to common carriers engaged in interstate commerce, and provides for an attempt to be made at mediation by two designated government officials in controversies between common carriers and their employees, and, in case of the failure of such an attempt, for a board of arbitration consisting of the same officials together with certain other parties to be selected. Such arbitration boards are to be formed only at the request or upon the consent of both parties to the controversy.

The enforcement of laws by executive or judicial action is an important matter relating to labour legislation, for without action such laws would remain dead letters. Under the constitutions of the states, the governor is the commander-in-chief of the military forces, and he has the power to order the militia or any part of it into active service in case of insurrection, invasion, tumult, riots or breaches of the peace or imminent danger thereof. Frequent action has been taken in the case of strikes with the view of preventing or suppressing violence threatened or happening to persons or property, the effect being, however, that the militia protects those working or desiring to work, or the employers. The president of the United States may use the land and naval forces whenever by reason of insurrection, domestic violence, unlawful obstructions, conspiracy, combinations or assemblages of persons it becomes impracticable to enforce the laws of the land by the ordinary course of judicial proceedings, or when the execution of the laws is so hindered by reason of such events that any portion or class of the people are deprived thereby of their rights and privileges under the laws, or when the laws are so inadequate, to the power of the United States forces have been used for the protection of both employers and employees indirectly, the purpose being to protect mails and, as in the states, to see that the laws are carried out.

The power of the courts to interfere in labour disputes is through the injunction and punishment thereunder for contempt of court. It is a principle of law that when there are interferences, actual or threatened, with property or with rights of a pecuniary nature, and the common or statute law offers no adequate and immediate remedy for the prevention of injury, a court of equity may interpose and issue its order or injunction as to what must or must not be done, a violation of which writ gives the court which issued it the power to punish for contempt. The doctrine is that something is necessary to be done to stop at once the destruction of property and the obstruction of business, and the injunction is immediate in its action. This writ has been resorted to frequently for the indirect protection of employers and employees.

(c. D. W.)

LABOUR PARTY—LABRADOR

CONTINENTAL EUROPE: Annuale de la Legislation du Travail (Bruxelles, 1898-1906); Hymnne et Seril des Travailleurs dans les Ateliers Industriels (Paris, 1893); Bulletin de l'Office International du Travail (Paris, 1895-1900); Bulletin du Congres International de Legislation du Travail (1896); Direktion und Verwaltung fur die deutsche Reichs. LABOUR PARTY, in Great Britain, the name given to the party in parliament composed of working-class representatives. As the result of the Reform Act of 1834, extending the franchise to a larger new working-class electorate, the votes of "labour" became more and more a matter of importance to politicians; and the Liberal party, seeking for the support of organized labour in the trade unions, found room for a few working-class representatives, who, however, acted and voted as Liberals. It was not till 1893 that the Independent Labour party, splitting off under Mr J. Keir Hardie (b. 1856) from the socialist organization known as the Social Democratic Federation (founded 1881), was formed at Bradford, with the object of getting independent candidates returned to parliament on a socialist programme. In 1890 Mr Keir Hardie, who as secretary of the Lanarkshire Miners’ Union had stood unsuccessfully as a labour candidate for Mr Lanark in 1888, and as M.P. for West Ham in 1892-1895, stood again for parliament for Meryth-Tydvil by its efforts, and in 1896 he returned the seat. Of the 30 members, Mr Keir Hardie being chairman of the group. Meanwhile in 1890 the Trade Union Congress instructed its Parliamentary committee to call a conference on the question of labour representation; and in February 1900 this was attended by trade union delegates and also by representatives of the Independent Labour party, the Social Democratic Federation and the Fabian Society. A resolution was carried "to establish a distinct labour group in parliament, who shall have their own whips, and agree upon their own policy, which must embrace a readiness to operate with any party which for the time being may be engaged in legislation in the direct interest of labour," and the committee (the Labour Representation Committee) was elected for the purpose. Under their auspices 29 out of 51 candidates were returned at the election of 1906. These groups were distinct from the Labour members ("Lib-Labs") who obeyed the Liberal whips and acted with the Liberals. In 1908 the attempts to unite the parliamentary representatives of the Independent Labour party with the Trades Union members were successful. In June of that year the Miners’ Federation, returning 15 members, joined the Independent Labour party, now known for parliamentary purposes as the "Labour Party"; other Trades Unions, such as the Amalgamated Society of Railway Servants, took the same step. This arrangement came into force at the general election of 1910, when the bulk of the miners’ representatives signed the constitution of the Labour party, which after the election numbered 49 members of parliament.

LABRADOR, a great peninsula in British North America, bounded e. by the North Atlantic, n. by Hudson Strait, w. by Hudson and James Bays, and s. by an arbitrary line extending eastward from the south-east corner of Hudson Bay, near 56° N., to the mouth of the Moisie river, on the Gulf of St Lawrence, in 50° N., and thence eastward by the Gulf of St Lawrence. It extends from 50° to 63° N., and from 55° to 80° W., and embraces an approximate area of 511,000 sq. m. Recent explorations have added greatly to the knowledge of this vast region, and it is shown that much of the peninsula is not a land of "awful desolation," but a well-wooded country, containing latent resources of value in its forests, fisheries and minerals.

Physical Geography.—Labrador forms the eastern limb of the V in the Archean protaxis of North America (see Canada), and includes most of the highest parts of that area. Along some portions of the coasts of Hudson and also of Ungava Bay there is a fringe of lowland, but most of the interior is a plateau rising toward the south and west. The highest portion extends east and west between 52° and 54° N. The most prominent area lies between the headwaters of the larger rivers of the four principal drainage basins. The lowest area is between Hudson Bay and Ungava Bay in the north-west, where the general level is not more than 500 ft. above the sea. The most prominent areas are the easternmost along the Atlantic coast, extending from the Strait of Belle Isle to Cape Beale, where half they rarely exceed 1500 ft., but increase in the northern half to a general elevation of upwards of 2000 ft., with numerous sharp peaks between 3000 and 4000 ft. of sea-level. Some have 7000 or 8000 ft. The coasts are deeply indented by irregular gulfs, and the interior is intersected by some long, narrow, nearly parallel islands, especially along the high Atlantic coast, where long narrow fjords penetrate inland. Hamilton Inlet, 250 m. north of the Strait of Belle Isle, is the longest of these bays, with a length of 150 m. and a breadth varying from 5 to 100 m. The northernmost portions of the plateau are deeply scored by valleys, cut into the crystalline rocks by the natural erosion of rivers, depending for their length and depth upon the volume of water flowing through them. The valley of the Hamilton river, on the eastern side, is cut with large lakes, many of great size, including Mistassini, Misikamau, Clayoquot, and Seal, all from 50 to 100 m. long. The streams discharging these lakes, before entering their valleys, flow on a level with the country and occupy all depressions, and they frequently spread out into lake-expansions and are often divided into numerous channels by islands. The descent into the valleys is usually abrupt, being made by heavy rapids and falls; the Hamilton, from the level interior, in a distance of 15 m., falls 760 ft. into the head of its valley, this descent including a sheer drop of over 750 ft., the river, taken with the large volume of the river, makes it the greatest fall in North America. The rivers of the northern and western watersheds drain about one-third of the peninsula; the most important of the former are the Kouchibouguac and the Restigouche; of the latter, the Moisie, passes between 5000 and 7600 ft. One of the principal streams, the George, Whale and Payne rivers, all flowing into Ungava Bay. The large rivers flowing westwards into Hudson Bay are the Povungnituk, Kegukaluk, Great Whale, Big East Main and Ruparte, varying in length from 300 to 500 m. The rivers flowing south are exceedingly rapid, the Moisie, Romaine, Naskatok, and Augustine being the most important; all are about 300 m. long. The Atlantic coast range throws most of the drainage northwards into the Ungava basin, and only small streams fall into the ocean, except the Hamilton, North-west and Kenamou, which empty into the head of Hamilton Inlet.

Geology.—The peninsula is formed largely of crystalline schists and gneisses, associated with granite, quartzes and other igneous rocks, all of archean age; there are also masses of strati-fied limestones, clays, shales and iron ores, the unaltered equivalents of part of the schists and gneisses. Narrow strips of Ankimkie (Upper Huronian or perhaps Cambrian) rocks occur along the lowlying parts, and these when exposed yield other evidence of the age of the peninsula. At some points the relicts of the decomposed rock by glaciers, and to the unequal weathering of the component rocks, it is now a plateau, which ascends somewhat abruptly within a few miles of the coast-line to heights of between

1 From the Portuguese llavrador (a yeoman farmer). The name was originally given to Greenland (1st half of 16th century) and was transferred to the peninsula in the belief that it formed part of the same country as Greenland. The name was bestowed on him who first gave notice of seeing it (Greenland) was a farmer (llavrador) from the Azores. See the historical sketch of Labrador by W. S. Wallace in Greenfell’s Labrador, etc., 1890.
500 and 2000 ft. The interior is undulating, and traversed by ridges of low, rounded hills, seldom rising more than 500 ft. above the surrounding general level.

Minerals.—The mineral wealth is undeveloped. Thick beds of excellent iron ore cover large areas in the interior and along the white shores of Hudson and Ungava Bays. Large areas of mineralized Huronian rocks have also been discovered, similar to areas in other parts of Canada, where they contain valuable deposits of gold, copper, nickel and leading; good prospects for the metals have been found.

Climate.—The climate ranges from cold temperate on the western coasts to arctic on Hudson Strait, and is generally so rigorous that it is doubtful if the country is fit for agriculture north of 51°, except on the low grounds near the coast. On James Bay good crops of potatoes are grown, and the trees include birch, willow and spruce. Near the head of Hamilton Inlet, on the east coast, and in nearly the same latitude, similar crops are easily cultivated. On the outer coasts the climate is more rigorous, being affected by the floating ice borne southward. The interior temperature of the month of January is 50° 30′ S., a crop of potatoes is raised annually, but they rarely mature. No attempts at agriculture have been made elsewhere inland. Owing to the absence of grass plains, there is little likelihood that it will ever be a grazing district. There are the two seasons in the interior: winter begins early in October, with the freezing of the small lakes, and lasts until the middle of June, when the ice on rivers and lakes melts and summer suddenly bursts forth. From November to March the temperature in the interior range from −50° F. to −60° F., and are slightly higher along the coast. The mean summer temperature of the interior is about 55° F., with frosts during every month in the northern portion. On the coast the cold never persists long, and the temperature between the 1st and 15th of December, and these coasts remain ice-bound until late in June. Hudson Strait is usually sufficiently open for navigation about the 10th of July.

Vegetation.—The southern half is included in the sub-arctic forest belt, the species of trees constitute the whole arborescent flora of this region; these species are the white birch, poplar, aspen, cedar, Banksian pine, white and black spruce, balsam fir and larch. The forest is continuous over the southern portion to 53° N., the only exception being a belt of tundra along the coast. While the forest is continuous along the Atlantic and Hudson Bay, while the low margins and river valleys contain much valuable timber. To the northward the size and number of barren areas rapidly increase, so that in 55° N. more than one-third of the country is treeless, and two-thirds are composed of tundra. Beyond the limit of trees is reached, leaving, to the northward, only barrens covered with low Arctic flowering plants, sedges and lichens.

Fisheries.—The fisheries along the shores of the Gulf of St Lawrence are practically the only industry of the few population scattered along the coasts, as well as of a large proportion of the inhabitants of Newfoundland. The census (1891) of Newfoundland gave 10,478 men, 2081 women and 828 children employed in the Labrador fishery. The lowest temperatures of the year are from 33° to 58°; the total catch being 488,788 quintals of cod, 1275 tons of salmon and 3828 barrels of herring, which, compared with the customs returns for 1886, showed an increase of cod and decreases of salmon and herring. The salmon fishing along the coast of Labrador is now very small, the decrease being probably due to the excessive use of cod-traps. The cod fishery is now carried on along the entire Atlantic coast and into the eastern part of Ungava Bay, where excellent catches have been made during the autumn of 1893. The annual value of the fisheries on the Canadian portion of the coast is about $150,000. The fisheries of Hudson Bay and of the interior are wholly undeveloped, though both the bay and the large lakes of the interior are well stocked with several species of excellent fish, including Arctic trout, brook trout, lake trout, white fish, sturgeon and pickerel.

Population.—The population is approximately 16,500, or about one person to every 35 sq. m.; it is made up of 3,500 Indians, 2,000 Eskimo and 9,000 whites. The last are confined to the coasts and to the Hudson Bay Company’s trading posts of the interior. On the Atlantic coast they are largely immigrants from Newfoundland, together with descendants of English fishermen and Hudson Bay Company’s servants. To the north of Hamilton Inlet they are of more or less mixed blood from marriage with Eskimo women. The Newfoundland census of 1901 gave 3634 as the number of permanent white residents along the Atlantic coast, and the Canadian census (1891) gave a white population of 3788, mostly French Canadians, scattered along the north shore of the Gulf of St Lawrence, while the whites living at the inland posts did not exceed fifty persons. It is difficult to give more than a rough approximation of the number of the native population, owing to their habits of roving from one trading post to another, and the consequent liability of counting the same family several times if the returns are computed from the books of the various posts, the only available data for an enumeration. The following estimate is arrived at in this manner: Indians—west coast, 1200; Ungava Bay, 200; east coast, 200; south coast, 1900. Eskimo—Atlantic coast, 1000; south shore of Hudson Strait, 200; east coast of Hudson Bay, 500. The Indians roam over the southern interior in small bands, their northern limit being determined by that of the trees on which they depend for fuel. They live wholly by the chase, and their numbers are dependent upon the deer and other animals; as a consequence there is a constant struggle between the Indian and the lower animals for existence, with great slaughter of the latter, followed by periodic famines among the natives, which greatly reduce their numbers and maintain an equilibrium. The native population has thus remained about stationary for the last two centuries. The Indians belong to the Algonquin family, and speak dialects of the Cree language. By contact with missionaries and fur-traders they are more or less civilized, and the great majority of them are Christians. Those living north of St Lawrence are Roman Catholic, while the Indians of the western watershed have been converted by the missionaries of the Church Mission Society; the eastern and northern bands have not yet been reached by the missionaries, and are still pagans. The Eskimos of the Atlantic coast, who live in the far interior, with the great number of the Moravian missionaries, and are well advanced in civilization; those of Hudson Bay have been taught by the Church Mission Society, and promise well; while the Eskimo of Hudson Strait alone remain without teachers, and are pagans. The Eskimo live along the coasts, only going inland for short periods to hunt the barren-ground caribou for their winter clothing; the rest of the year they remain on the shore or the ice, hunting seals and porpoises, which afford them food, clothing and fuel. The christianized Indians and Eskimo read and write in their own language; those under the teaching of the Church Mission Society use a syllabic character, the others make use of the ordinary alphabet.

Political Review.—The peninsula is divided politically between the governments of Canada, Newfoundland and the province of Quebec. The government of Newfoundland, under Letters Patent of the 28th of March 1876, exercises jurisdiction along the Atlantic coast; the boundary between its territory and that of Canada is a line running due north and south from Anse Sablon, on the north shore of the Strait of Belle Isle, to 53° N. the remainder of the boundary being as yet undetermined. The northern portion of the province of Quebec follows the East Main river to its source in Patamisk Lake, thence by a line due east to the Ashuapmi branch of the Hamilton river; it then follows that river and Hamilton Inlet to the coast area under the jurisdiction of Newfoundland. The remainder of the peninsula, north of the province of Quebec, by order in council dated the 18th of December 1897, was constituted Ungava District, an unorganized territory under the jurisdiction of the government of the Dominion of Canada.

LABRADORITE, or LABRADOR SPAR, a lime-soda felspar of the plagioclase (q.r.s.) group, often cut and polished as an ornamental stone. It takes its name from the coast of Labrador, where it was discovered, as boulders, by the Moravian Mission about 1770, and specimens were soon afterwards sent to the secretary in London, the Rev. B. Latrobe. The felspar itself is generally of a dull grey colour, with a rather greasy lustre, but many specimens exhibit in certain directions a magnificent
play of colours—blue, green, orange, purple or red; the colour in some specimens changing when the stone is viewed in different directions. This optical effect, known sometimes as “labrador-escence,” seems due in some cases to the presence of minute laminae of certain minerals, like gothite or haematite, arranged parallel to the surface which reflects the colour; but in other cases it may be caused not so much by inclusions as by a delicate lamellar structure in the felspar. An aventurine effect is produced by the presence of microscopic enclosures. The original labradorite was found in the neighbourhood of Nain, notably in a lagoon about 50 m. inland, and in St Paul's Island. Here it occurs with hypersthenite, a rich brownish sheen, forming a coarse-grained norite. When wet, the stones are remarkably brilliant, and have been called by the natives “fire rocks.” Russia has also yielded chatoyant labradorite, especially near Kiev and in Finland; a fine blue labradorite has been brought from Queenslander; and the mineral is also known in several localities in the United States, as at Keeseville, in Essex county, New York. The ornamental stone from south Norway, now largely used as a decorative material in architecture, owes its beauty to a felspar with a blue opalescence, often called labradorite, but really a kind of orthoclase which Professor W. C. Brögger has termed cryptoperthite, whilst the rock in which it occurs is a augite-syenite called by him laurvigeite, from its chief locality, Laurvik in Norway. Common labradorite, without play of colour, is an important constituent of such rocks as gabro, diorite, and plagioclase. (See Plagioclase.) Ejected crystals of labradorite are found on Monti Rossi, a double parasitic cone on Etna.

The term labradorite is unfortunately used also as a rock-name, having been applied by Fouqué and Lévy to a group of basic rocks rich in augite and poor in olivine. (F. W. R.)

**LABRADOR TEA**, the popular name for a species of _Ledum_, a small evergreen shrub growing in bogs and swamps in Greenland and the more northern parts of North America. The leaves are tough, densely covered with brown wool on the under face, fragrant when crushed and have been used as a substitute for tea. The plant is a member of the heath family (Ericaceae).

**LABRUM** (Lat. for “lip”), the large vessel of the warm bath in the Roman thermae. These were cut out of great blocks of marble and granite, and have generally an overhanging lip. There is one in the Vatican of porphyry over 12 ft. in diameter. The term _labrum_ is used in zoology, of a lip or lip-like part; in entomology it is applied specifically to the upper lip of an insect, the lower lip being termed _labium_.

**LA BRUYÈRE, JEAN DE** (1645–1696), French essayist and moralist, was born in Paris on the 16th of August 1645, and not, as was once the common statement, at Dourdan (Seine-et-Oise) in 1639. His family was of the middle class, and his reference to a certain Geoffrey de la Bruyère, a crusader, is only a satirical illustration of a method of self-en noblement common in France as in other countries. Indeed he himself always signed the name Delabruyère in one word, thus avowing his _roture_. His progenitors, however, were of respectable position, and he could trace them back at least as far as his great-grandfather, who had been a strong Leaguer. La Bruyère’s own father was controller-general of finance to the Hôtel de Ville. The son was educated by the Oratorians and at the university of Orleans; he was called to the bar, and in 1673 bought a post in the revenue department at Caen, which gave the status of noblesse and a certain income. In 1688 he sold this office. His predecessor in it, it seems, had been the amiable Monsieur de Polignac, who was the cause of La Bruyère’s introduction to the great orator, Bossuet, who from the date of his own preceptorship of the dauphin, was a kind of agent-general for tutorships in the royal family. Introduced him in 1684 to the household of the great Condé, to whose grandson Henri Jules de Bourbon as well as to that prince’s girl-bride Marie de Nantes, one of Louis XIV’s natural children, La Bruyère became tutor. The rest of his life was passed in the household of the prince or else at court, and he seems to have profited by the inclination which all the Condé family had for the society of men of letters. Very little is known of the events of this part—or, indeed, of any part—of his life. The impression derived from the few notices of him is of a silent, observant, but somewhat awkward man, resembling in manners Joseph Addison, whose master in literature La Bruyère undoubtedly was. Yet despite the numerous enemies which his book raised up for him, most of these notices are favourable—notably that of Saint-Simon, an acute judge and one bitterly prejudiced against _roturiers_ generally. There is, however, a curious passage in a letter from Boileau to Racine in which he regrets that “nature has not made La Bruyère as agreeable as he would like to be.” His _Caractères_ appeared in 1688, and at once, as Nicolas de Malezieu had predicted, brought him “bien des lecteurs et bien des ennemis.” At the head of these were Thomas Corneille, Fontenelle and Benserade, who were pretty clearly aimed at in the book, as well as innumerable other persons, men and women of letters as well as of society, on whom the cap of La Bruyère’s fancy-portraits was fitter by manuscript “keys” compiled by the scribblers of the day. The friendship of Bossuet and still more the protection of the Condé sufficiently defended the author, and he continued to insert fresh portraits of his contemporaries in each new edition of his book, especially in the 4th (1698). Those, however, whom he had attacked were powerful in the Academy, and numerous defeats awaited La Bruyère before he could make his way into that guarded hold. He was defeated thrice in 1691, and on one memorable occasion he had but seven votes in favour of those of Bossuet, Boileau, Racine, Pellisson and Bussy-Rabutin. It was not till 1693 that he was elected, and even then an epigram, which, considering his admitted insignificance in conversation, was not of the worst, _haestis latere_—

“Quand la Bruyère se présente
Pourquoi faut-il crier hon? 
Ne faillot-il pas un zéro ?”

His unpopularity was, however, chiefly confined to the subjects of his sarcastic portraiture, and to the hack writers of the time, of whom he was wont to speak with a disdain only surpassed by that of Pope. His description of the _Mercure galant_ as “immédiatement au dessous de rien” is the best-remembered specimen of these unwise attacks; and would of itself account for the enmity of the editors, Fontenelle and the younger Cornelle. La Bruyère’s discourse of admission at the Academy, one of the best of its kind, was, like his admission itself, severely criticized, especially by the partisans of the “Ancient and Modern” quarrel. With the _Caractères_, the translation of Theophrastus, and a few letters, most of them addressed to the prince de Condé, it completes the list of his literary work, with the exception of a curious and much-disputed posthumous treatise. La Bruyère died very suddenly, and not long after his admission to the Academy. He is said to have been struck with dumbness in an assembly of his friends, and, being carried home to the Hôtel de Condé, to have expired of apoplexy a day or two afterwards, on the 10th of May 1696. It is not surprising that, considering the recent panic about poisoning, the bitter personal enmities which he had excited and the peculiar circumstances of his death, suspicions of foul play should have been entertained, but there was apparently no foundation for them. Two years after his death appeared certain _Dialogues sur le Quidisme_, alleged to have been found among his papers incomplete, and to have been completed by the editor. As these dialogues are far inferior in literary merit to La Bruyère’s other works, their genuineness has been denied. But the straightforward and circumstantial account of their appearance given by this editor, the Abbé du Pin, a man of acknowledged probity, the intimacy of La Bruyère with Bossuet, whose views in his contest with Fénelon these dialogues are designed to further, and the entire absence, at so short a time after the alleged author’s death, of the least protest on the part of his friends and representatives, seem to be decisive in their favour.

Although it is permissible to doubt whether the value of the _Caractères_ has not been somewhat exaggerated by traditional French criticism, they deserve beyond all question a high place.
The plan of the book is thoroughly original, if that term may be accorded to a novel and skilful combination of existing elements. The treatise of Theophrastus may have furnished the first idea, but it gave little more. With the ethical generalisations and social Dutch painting of his original La Bruyère combined the peculiarities of the Montaigne essay, of the Pensées and Maximes of which Pascal and La Rochefoucauld are the masters respectively, and lastly of that peculiar 17th-century product, the "portrait" or elaborative literary picture of the personal and mental characteristics of an individual. The result was quite unlike anything that had been before seen, and it has not been exactly reproduced since, though the essay of Addison and Steele resembles it very closely, especially in the introduction of fancy portraits. In the titles of his work, and in its extreme desultoriness, La Bruyère reminds the reader of Montaigne, but he aimed too much at sententiousness to attempt even the apparent continuity of the great essayist. The short paragraphs of which his chapters consist are made up of maxims proper, of criticisms literary and ethical, and above all of the celebrated sketches of individuals baptized with names taken from the plays and romances of the time. These last are the great feature of the work, and that which gave it its immediate if it is not its enduring popularity. They are wonderfully piquant, extremely life-like in a certain sense, and must have given great pleasure or more frequently exquisite pain to the originals, who were in many cases unmistakable and in most recognizable.

But there is something wanting in them. The criticism of Charpentier, who received La Bruyère at the Academy, and who was of the opposite faction, is in fact fully justified as far as it goes. La Bruyère literally "est [trop] descendu dans le particulier." He has neither, like Molière, embodied abstract peculiarities in a single life-like type, nor has he, like Shakespeare, made the individual pass sub speciem aternitatis, and serve as a type while retaining his individuality. He is a photographer rather than an artist in his portraiture. So, too, his maxims, admirably as they are expressed, and exact as their truth often is, are on a lower level than those of La Rochefoucauld. Beside the sculpturesque precision, the Roman brevity, the profundity of observation, "piercing to the accepted hells beneath," of the great Frenchman La Bruyère has the air of a literary petit-maitre dressing up superficial observation in the finery of esprit. It is indeed only by comparison that he loses, but then it is by comparison that he is usually praised. His wit and his personal "malice" have done much to give him his rank in French literature, but much must also be allowed to his purely literary merits. With Racine and Massillon he is probably the very best writer of what is somewhat arbitrarily styled classical French. He is hardly ever incorrect—the highest merit in the eyes of a French academic critic. He is always well-bred, never obscure, rarely though sometimes "precious" in the turns and niceties of language in which he delights to indulge, in his avowed design of attracting readers by form, now that, in point of matter, "tout est dit." It ought to be added to his credit that he was sensible of the folly of impoverishing French by ejecting old words. His chapter on "Les ouvrages de l'esprit" contains much good criticism, though it shows that, like most of his contemporaries except Fénelon, he was lamentably ignorant of the literature of his own tongue.

The editions of La Bruyère, both partial and complete, have been extremely numerous. Les Caractères de Théophraste traduits du Grec, with les caractères et les mœurs de ce siècle, appeared for the first time in 1689, being published by Michallet, to whose little daughter, according to tradition, La Bruyère gave the profits of the book. The edition of the complete works, published by Dufay in the same year. In the following year, and in each year until 1694, with the exception of 1693, a fresh edition appeared, and, in all these five, additions, omissions and alterations were largely made. A ninth edition, published in 1696, remained unaltered to the day of the author's death. The Academy speech appeared in the eighth edition. The Quietist dialogues were published in 1699; most of the letters, including those addressed to Condé, not till 1867. In recent times numerous editions of the complete works have appeared, notably those of Wulkenaer (1845), Servois (1867), in the series of Grands écrivains de la France, Asselineau (a scholarly reprint of the last original edition, 1872) and finally Chassagn (1876); the last is one of the most generally useful, as the editor has collected almost everything of value in his predecessors. The literature of "keys" to La Bruyère is extensive and apocryphal. Almost everything that can be done in this direction and in that of general illustration was done by Edmond Bourrini in his learned and amusing Comédie de La Bruyère (1856); M. Paul Morillon contributed a memoir on La Bruyère to the series of Grands écrivains français in 1904.

LABUAN

A corruption of the Malay word labuh-an, signifying an "anchor-light"); an island of the Malay Archipelago, off the north-west coast of Borneo in 5° 16' N., 115° 15' E. Its area is 30-23 sq. m.; it is distant about 6 m. from the mainland of Borneo at the nearest point, and lies opposite to the northern end of the great Brunei Bay. The island is covered with low hills rising from flat nears to an irregular plateau near the centre. About 5,000 acres are under rice cultivation, and there are scattered patches of carrots and sago palms and a few vegetable gardens, the latter owned by the most part by Chinese. For the rest Labuan is covered over much of its extent by vigorous secondary growth, amid which the charred trunks of trees rise at frequent intervals, the greater part of the forest of the island having been destroyed by great accidental conflagrations. Labuan was ceded to Great Britain in 1846, chiefly through the instrumentality of Sir James Brooke, the first raja of Sarawak, and was occupied two years later. At the time of its cession the island was uninhabited, but in 1881 the population numbered 5731, though it had declined to 5361 in 1891. The census returns for 1901 give the population at 8417. The native population consists of Malay fishermen, Chinese, Tamils and small shifting communities of Kadayans, Tutong and other natives of the neighbouring Bornean coast. There are about fifty European residents. At the time of its occupation by Great Britain a brilliant future was predicted for Labuan, which it was thought would become a second Singapore. These hopes have not been realized. The coal deposits, which are of somewhat indifferent quality, have been worked with varying degrees of success by a succession of companies, one of which, the Labuan & Borneo Ltd., liquidated in 1902 after the collapse of a shaft upon which large sums had been expended. It was succeeded by the Labuan Coalfields Ltd. The harbour is a fine one, and the above-named company possesses three wharves capable of berthing the largest Eastern-going ocean steamers. To-day Labuan chiefly exists as a trading depot for the natives of the neighbouring coast of Borneo, who sell their produce—beeswax, edible birds-nests, camphor, gutta, trepang, &c.,—to Chinese shopkeepers, who resell it in Singapore. There is also a considerable trade in sago, much of which is produced on the mainland, and there are three small sago-factories on the island where the raw product is converted into flour. The Eastern Extension Telegraph Company has a central station at Labuan with cables to Singapore, Hong-Kong and British North Borneo. Monthly steam communication is maintained by a German firm between Labuan, Singapore and the Philippines. The colony joined the Imperial Penny Postage Union in 1889. There are a few miles of road on the island and a metre-gauge railway from the harbour to the coal mines, the property of the company. There is a Roman Catholic mission with a resident priest, an Anglican church visited periodically by a clergyman from the mainland, two native Missions, Chinese schools, and a sailors' club, built by the Roman Catholic mission. The bishop of Singapore and Sarawak is also bishop of Labuan. The European graveyard has repeatedly been the scene of outrages perpetrated, it is believed, by natives from the mainland of Borneo, the graves being rifed and the hair of the head and other parts of the corpses being carried off to furnish ornaments to weapons and ingredients in the magic philtres of the natives. Pulau Dat, a small island in the near neighbourhood of Labuan, is the site of a fine coco-nut plantation whence nuts and copra are exported in bulk. The climate is hot and very humid.

Until 1869 the expenditure of the colony was partly defrayed by imperial grants-in-aid, but after that date it was left to its own resources. A garrison of imperial troops was maintained until 1871, when the troops were withdrawn after many deaths from fever and dysentery had occurred among them. Since then law and order
have been maintained without difficulty by a small mixed police force of Punjabs and Malays. From the 1st of January 1890 to the 1st of January 1906 Labuan was transferred for administrative purposes to the British North Borneo Company, the governor for the time being of the company's territories holding also the royal commission as governor of Labuan. This arrangement did not work satisfactorily and called forth frequent petitions and protests from the colonists. Labuan was then placed under the government of the Straits Settlements, and is administered by a deputy governor who is a member of the Straits Civil Service.

**LABURNUM**, known botanically as *Laburnum vulgare* (or *Cytisus Laburnum*), a familiar tree of the pea family (*Leguminosae*); it is also known as "golden chain" and "golden rain." It is native of the mountains of France, Switzerland, southern Germany, northern Italy, &c., has long been cultivated as an ornamental tree throughout Europe, and was introduced into north-east America by the European colonists. Gerard records it as growing in his garden in 1597 under the names of anagyris, laburnum or beane trefoyle (Herball, p. 1339), but the date of its introduction into England appears to be unknown. In France it is called la vaurou— a corruption from laburnum according to Du Hamel—as also arbós, i.e. arc-bois, "the wood having been used by the ancient Gauls for bows. It is still so employed in some parts of the Mâconnais, where the bows are found to preserve their strength and elasticity for half a century" (Loudon, Arboretum, ii. 500).

Several varieties of this tree are cultivated, differing in the size of the flowers, in the form of the foliage, &c., such as the "oak-leaved" (*quercifolium*), *pendulum*, *crispum*, &c.; var. *auratum* has golden yellow leaves. One of the most remarkable forms is *Cytisus Adamii* (*C. purpurascens*), which bears three kinds of blossoms, viz. racemes of pure yellow flowers, others of a purple colour and others of an intermediate brick-red tint. The last are hybrid blossoms, and are sterile, with malformed ovules, though the pollen appears to be good. The yellow and purple "reversions" are fertile. It originated in Paris in 1828 by M. Adam, who inserted a "shield" of the bark of *Cytisus purpurascens* into a stock of Laburnum. A vigorous shoot from this bud was subsequently propagated. Hence it would appear that the two distinct species became united by their cambium layers, and the trees propagated therefrom subsequently reverted to their respective parentages in bearing both yellow and purple flowers, but produce as well blossoms of an intermediate or hybrid character. Such a result may be called a "graft-hybrid." For full details see Darwin's *Animals and Plants under Domestication*.

The laburnum has highly poisonous properties. The roots taste like liquorice, which is a member of the same family as the laburnum. It has proved fatal to cattle, though hares and rabbits eat the bark of it with avidity (Gardiner, Cyclopedia, 1881, vol. xvi. p. 666). The seeds are also highly poisonous, possessing emetic as well as acrid narcotic principles, especially in a green state. Gerard (loc. cit.) alludes to the powerful effect produced on the system by taking the bruised leaves medicinally. Pliny states that bees will not visit the flowers (N. H. xvi. 31), but this is an error, as bees and butterflies play an important part in the fertilization of the flowers, which visit for the nectar.

The heart wood of the laburnum is of a dark reddish-brown colour, hard and durable, and takes a good polish. Hence it is much prized by turners, and used with other coloured woods for inlaying purposes. The laburnum has been called false ebony from this character of its wood.

**LABYRINTH** (Gr. λαβύρινθος, Lat. *labyrinthus*), the name given by the Greeks and Romans to buildings, entire or partly subterranean, containing a number of chambers and intricate passages, which rendered egress puzzling and difficult. The word is considered by some to be of Egyptian origin, while others connect it with the Gr. λαβύριον, the passage of a mine. Another derivation is suggested from λαβύρισ, a Lydian or Carian word meaning a "double-edged axe" (Journal of Hellenic Studies, xxi. 109, 268), according to which the Lycian labyrinth or palace of Minos was the house of the double axe, the symbol of Zeus.

Pliny (Nat. Hist. xxxvi. 19, 91) mentions the following as the four famous labyrinths of antiquity.

1. The Egyptian: of which a description is given by Herodotus (li. 143) and Strabo (xvii. 811). It was situated to the east of Lake Moeris, opposite the ancient site of Arsinoë or Crocodilopolis. According to Egyptologists, the word means "the temple at the entrance of the lake." According to Herodotus, the entire building, surrounded by a single wall, contained twelve courts and 3000 chambers, 1500 above and 1500 below ground. The roofs were wholly of stone, and the walls covered with sculpture. On one side stood a pyramid 40 orgiae, or about 243 ft. high. Herodotus himself went through the upper chambers, but was not permitted to visit those underground, which he was told contained the tombs of the kings who had built the labyrinth, and of the sacred crocodiles. Other ancient authorities considered that it was built as a place of meeting for the Egyptian nomes or political divisions; but it is more likely that it was intended for sepulchral purposes. It was the work of Amenemê III., of the 12th dynasty, who lived about 2700 B.C. It was first located by the Egyptologist Lepsius to the north of Hawara in the Fayum, and (in 1888) Flinders Petrie discovered its foundation, the extent of which is about 1000 ft. long by 800 ft. wide. Immediately to the north of it is the pyramid of Hawara, in which the mummies of the king and his daughter have been found (see W. M. Flinders Petrie, *Hawara, Bishahu, and Arsinoë, 1889*).

2. The Cretan: said to have been built by Daedalus on the plan of the Egyptian, and famous for its connexion with the legend of the Minotaur. It is doubtful whether it ever had any real existence and Diodorus Siculus says that in his time it had already disappeared. By the older writers it was placed near Cnosus, and is represented on coins of that city, but nothing corresponding to it has been found during the course of the recent excavations, unless the royal palace was meant. The rocks of Crete are full of winding caves, which gave the first idea of the legendary labyrinth. Later writers (for instance, Claudian, *De sexto Cons. Honori*um, 634) place it near Gortyna, and a set of winding passages and chambers close to that place is still pointed out as the labyrinth; these are, however, in reality ancient quarries.

3. The Lemnian: similar in construction to the Egyptian. Remains of it existed in the time of Pliny. Its chief feature was its 150 columns.

4. The Italian: a series of chambers in the lower part of the tomb of Porsena at Clusium. This tomb was 300 ft. square and 50 ft. high, and underneath it was a labyrinth, from which it was exceedingly difficult to find an exit without the assistance of a clew of thread. It has been maintained that this tomb is to be regarded as the mound named Poggio Gajella near Chiusi.

Lastly, Pliny (xxxvi. 19) applies the word to a rude drawing on the ground or pavement, to some extent anticipating the modern or garden maze.

On the Egyptian labyrinth see A. Wiedemann, *Ägyptische Geschicht*te (1884), p. 258, and his edition of the second book of Herodotus (1890); on the Cretan, C. Höck, *Kreta* (1823-1829), and
A. J. Evans in Journal of Hellenic Studies; on the subject generally, articles in Roscher's Lexikon der Mythologie and Doremberg and Saglio's Dictionnaire des antiquités.

In gardening, a labyrinth or maze means an intricate network of pathways enclosed by hedges or plantations, so that those who enter become bewildered in their efforts to find the centre or make their exit. It is a remnant of the old geometrical style of gardening. There are two methods of forming it. That which is perhaps the more common consists of walks, or alleys as they were formerly called, laid out and kept to an equal width or nearly so by parallel hedges, which should be so close and thick that the eye cannot readily penetrate them. The task is to get to the centre, which is often raised, and generally contains a covered seat, a fountain, a statue or even a small group of trees. After reaching this point the next thing is to return to the entrance, when it is found that ingress is as difficult as ingress. To every design of this sort there should be a key, but even those who know the key are apt to be perplexed. Sometimes the design consists of alleys only, as in fig. 1, published in 1706 by London and Wise. In such a case, when the farther end is reached, there only remains to travel back again. Of a more pretentious character was a design published by Switzer in 1742.

Fig. 2.—Labyrinth of Batty Langley.

Fig. 3.—Labyrinth at Versailles.

Fig. 4.—Maze at Hampton Court.

This is of octagonal form, with very numerous parallel hedges and paths, and "six different entrances, whereof there is but one that leads to the centre, and that is attended with some difficulties and a great many stops." Some of the older designs for labyrinths, however, avoid this close parallelism of the alleys, which, though equally involved and intricate in their windings, are carried through blocks of thick planting, as shown in fig. 2, from a design published in 1728 by Batty Langley. These blocks of shrubbery have been called wildernesses. To this latter class belongs the celebrated labyrinth at Versailles (fig. 3), of which Switzer observes, that it "is allowed by all to be the noblest of its kind in the world."

Whatever style be adopted, it is essential that there should be a thick healthy growth of the hedges or shrubberies that confine the wanderer. The trees used should be impenetrable to the eye, and so tall that no one can look over them; and the paths should be of gravel and well kept. The trees chiefly used for the hedges, and the best for the purpose, are the hornbeam among deciduous trees, or the yew among evergreens. The beech might be used instead of the hornbeam on suitable soil. The green holly might be planted as an evergreen with very good results, and so might the American arbor vitae if the natural soil presented no obstacle. The ground must be well prepared, so as to give the trees a good start, and a mulching of manure during the early years of their growth would be of much advantage. They must be kept trimmed in or clipped, especially in their earlier stages; trimming with the knife is much to be preferred to clipping with shears. Any plants getting much in advance of the rest should be topped, and the whole kept to some 4 ft. or 5 ft. in height until the lower parts are well thickened, when it may be allowed to acquire the allotted height by moderate annual increments. In cutting, the hedge (as indeed all hedges) should be
LABYRINTHULIDEA

kept broadest at the base and narrowed upwards, which prevents it from getting thin and bare below by the stronger growth being drawn to the tops.

The maze in the gardens at Hampton Court Palace (fig. 4) is considered one of the finest examples in England. It was planted in the early part of the reign of William III., though it has been supposed that a maze had existed there since the time of Henry VII. It is constructed on the hedge and alley system, and was, it is believed, originally planted with hornbeam, but many of the plants have been replaced by hollies, yews, &c., so that the vegetation is mixed. The walks are about half a mile in length, and the ground occupied is a little over a quarter of an acre. The centre contains two large trees, with a seat beneath each. The key to reach this resting place is to keep the right hand continuously in contact with the hedge from first to last, going round all the stops.

The maze in the gardens at Somerleyton Hall, near Lowestoft (fig. 5), was designed by Mr John Thomas. The hedges are of English yew, are about 6 ft. high, and have been planted about sixty years. In the centre is a grass mound, raised to the height of the hedges, and on this mound is a pagoda, approached by a curved grass path. At the two corners on the western side are banks of laurels 15 or 16 ft. high. On each side of the hedges throughout the labyrinth is a small strip of grass.

There was also a labyrinth at Theobald's Park, near Cheshunt, when this place passed from the earl of Salisbury into the possession of James I. Another is said to have existed at Wimbledon House, the seat of Earl Spencer, which was probably laid out by Brown in the 18th century. There is an interesting labyrinth, somewhat after the plan of fig 2, at Mistley Place, Manningtree.

When the gardens of the Royal Horticultural Society at South Kensington were being planned, Albert, Prince Consort, the president of the society, especially desired that there should be a maze formed in the ante-garden, which was made in the form shown in fig. 6. This labyrinth, designed by Lieut. W. A. Nesfield, was for many years the chief point of attraction to the younger visitors to the gardens; but it was allowed to go to ruin, and had to be destroyed. The gardens themselves are now built over. (T. Mo.)

LABYRINTHULIDEA, the name given by Sir Ray Lankester (1883) to Sarcodina (q.v.) forming a reticulate plasmodium, the denser masses united by fine pseudopodical threads, hardly distinct from some Proteomyxa, such as Archerina.

This is a small and heterogeneous group, Labyrinthula, discovered by L. Cienkowski, forms a network of relatively stiff threads on which are scattered large spindly-shaped enlargements, each representing an amoeba, with a single nucleus. The threads are pseudopods, very slowly emitted and withdrawn. The amoebae multiply by fission in the active state. The nearest approach to a "reproductive" state is the approximation of the amoebae, and their separate encystment in an irregular heap,

Fig. 6.—Labyrinth in Horticultural Society's Garden.

1. A colony or "cell-heap" of Labyrinthula vitiellina, Cienk., crawling upon an Alga.
2. A colony or "cell-heap" of Chlamydomyxa labyrinthuloides, Archer, with fully expanded network of threads on which the oat-shaped corpuscles (cells) are moving.
3. A portion of the network of Labyrinthula vitiellina, Cienk., more highly magnified. p, Protoplasmic mass apparently produced by fusion of several filaments. p', Fusion of several cells which have lost their definite spindle-shaped contour. s, Corpuscles which have become spherical and are no longer moving (perhaps about to be encysted).
4. A single spindle cell and threads of Labyrinthula macrocystis, Cienk. n, Nucleus.
5. A group of encysted cells of L. Macrocyrtis, embedded in a tough secretion.
6. Encysted cells of L. Macrocyrtis, with enclosed protoplasm divided into four spores.
7, 8. Transverse division of a non-encysted spindly-cell of L. Macrocyrtis.
recalling the Acrasieae. From each cyst ultimately emerges a single amoeba, or more rarely four (figs. 6, 7). The saprophyte Diplophrys (f) stercorosa (Cienk.) appears closely allied to this.

Chlamydomyxa (W. Archer) resembles Labrynthula in its freely branched plasmodium, but contains yellowish chromatophores, and minute oval vesicles ("physodes") filled with a substance allied to tannin—possibly phloroglucin—which glide along the plasmodial tracks. The cell-body contains numerous nuclei; but in its active state is not resolvable into distinct oval amoeboids. It is amphitrophic, ingesting and digesting other Protista, as well as "assimilating" by its chromatophores, the product being oil, not starch. The whole body may form a laminated cellulose resting cyst, from which it may only temporarily emerge (fig. 2), or it may undergo resolution into nucleus cells which then encyst, and become multinucleate before rupturing the cyst aphis.

Leydenia (F. Schaudinn) is a parasite in malignant diseases of the pleura. The pseudopodia of adjoining cells unite to form a network; but its affinities seem to such social naked Foraminifera as Mikrogromia.

LAC, a resinous incrustation formed on the twigs and young branches of various trees by an insect, Coccus lacca, which infests them. The term lac (jaksha, Sanskrit; lak, Hindi) is the same as the numeral lak—a hundred thousand—and is indicative of the countless hosts of insects which make their appearance with every successive generation. Lac is a product of the East Indies, coming especially from Bengal, Pegu, Siam and Assam, and is produced by a number of trees of the species Ficus, particularly F. religiosa. The insect which yields it is closely allied to the cochineal insect, Coccus cacti; kermes, C. ilicis and Polish grains, C. polonicus, all of which, like the lac insect, yield a red colouring matter. The minute larval insects fasten in myriads on the young shoots, and, inserting their long proboscides into the bark, draw their nutriment from the sap of the plant. The insects begin at once to exude the resinous secretion over their entire bodies; this forms in effect a cocoon, and, the separate exudations coalescing, a continuous hard resinous layer regularly honeycombed with small cavities is deposited over and around the twig. From this living tomb the female insects, which form the great bulk of the whole, never escape. After their impregnation, which takes place on the liberation of the males about three months from their first appearance, the females develop into a singular amorphous organism consisting in its main features of a large smooth shining crimson-coloured sac—the ovary—with a beat stuck into the bark, and a few papillary processes projected above the resinous surface. The red fluid in the ovary is the substance which forms the lac dye of commerce. To obtain the largest amount of both resin and dye-stuff it is necessary to gather the twigs with their living inhabitants in or near June and November. Lac encrusting the twigs as gathered is known in commerce as "stick lac"; the resin crushed to small fragments and washed in hot water to free it from colouring matter constitutes "seed lac"; and this, when melted, strained through thick canvas, and spread out into thin layers, is known as "shellac," and is the form in which the resin is usually brought to European markets. Shellac varnishes, probably an almost pure black; the palest, known as "orange-lac," is the most valuable; the darker varieties—"liver-coloured," "ruby," "garnet," &c.—diminish in value as the colour deepens. Shellac may be bleached by dissolving it in a boiling bate of caustic potash and passing chlorine through the solution till all the resin is precipitated, the product being known as white shellac. Bleached lac takes light delicate shades of colour, and dyed a golden yellow it is much used in the East Indies for working into chain ornaments for the head and for other personal adornments. Lac is a principal ingredient in sealing-wax, and forms the basis of some of the most valuable varnishes, besides being useful in various cements, &c. Average stick lac contains about 68 % of resin, 10 of lac dye and 6 of a waxy substance. Lac dye is obtained by evaporating the water in which stick lac is washed, and comes into commerce in the form of small square cakes. It is in many respects similar to, although not identical with, cochineal.

LACAILLE, NICOLAS LOUIS DE (1713-1762), French astronomer, was born at Rumigny, in the Ardennes, on the 15th of March 1713. Left destitute by the death of his father, who held a post in the household of the duchess of Vendôme, his theological studies at the Collège de Lisieux in Paris were prosecuted at the expense of the duke of Bourbon. After he had taken dacon's orders, however, he devoted himself exclusively to science, and, through the patronage of J. Cassini, obtained employment, first in surveying the coast from Nantes to Bayonne, then, in 1739, in re-measuring the French arc of the meridian. The success of this difficult operation, which occupied two years, and achieved the correction of the anomalous result published by J. Cassini in 1718, was mainly due to Lacaille's industry and skill. He was rewarded by admission to the Academy and the appointment of mathematical professor in Mazarin college, where he worked in a small observatory fitted for his use. His desire to observe the southern heavens led him to propose, in 1750, an astronomical expedition to the Cape of Good Hope, which was officially sanctioned, and fortunately executed. Among its results were determinations of the lunar and of the solar parallax (Mars serving as an intermediary), the first measurement of a South African arc of the meridian, and the observation of 10,000 southern stars. On his return to Paris in 1754 Lacaille was distressed to find himself an object of public attention; he withdrew to Mazarin college, and there died, on the 21st of March 1762, of an attack of gout aggravated by unremitting toil. Lalande said of him that, during a comparatively short life, he had made more observations and calculations than all the astronomers of his time put together. The quality of his work riddled its quantity, while the disinterestedness and rectitude of his moral character earned him universal respect.

His principal works are: Astronomiae Fundamenta (1757), containing a standard catalogue of 398 stars, re-edited by F. Baily (Michigan, 1875); Coelum aureum or Tabulae astri quadratae stelliferorum (1756) (edited by J. D. Maraldi), giving zone-observations of 10,000 stars, and describing fourteen new constellations; Observations sur 515 étoiles du Zodiac (published in t. iv. of the Éphémérides du calcul des Ephémérides, 1741), frequently reprinted; ditto de Mécanique (1743), &c.; ditto d'Astronomie (1746), 4th edition augmented by Lalande (1779); ditto d'Optique (1750), &c. Calculations by him of eclipses for eighteen hundred years were inserted in L'Art de dresser les dates (1753); he communicated to the Academy in 1755 a classified catalogue of forty-two southern nebulae, and gave in t. ii. of his Éphémérides (1755) practical rules for the employment of the lunar method of longitudes, proposing in his additions to Pierre Bouguer's Traité de Navigation (1760) the model of a naval almanac.

of Gladstone's famous letters to Lord Aberdeen he was obliged to leave Naples. He first settled in Edinburgh, where he married Maria Carmichael, and then in London where he made numerous friends in literary and political circles, and was professor of Italian at Queen's College from 1833 to 1836. In the latter year he accompanied Lord Minto to Italy, on which occasion he first met Cavour. From 1857 to 1863 he was private secretary (non-political) to Lord Lansdowne, and in 1858 he accompanied Gladstone to the Ionian Islands as secretary, for which services he was made a K.C.M.G. the following year. In 1860 Francis II. of Naples had implored Napoleon III. to send a squadron to prevent Garibaldi from crossing over from Sicily to Calabria; the emperor expressed himself willing to do so provided Great Britain co-operated, and Lord John Russell was at first inclined to agree. At this juncture Cavour, having heard of the scheme, entrusted Lacaita, at the suggestion of Sir James Hudson, the British minister at Turin, with the task of inducing Russell to refuse co-operation. Lacaita, who was an intimate friend both of Russell and his wife, succeeded, with the help of the latter, in winning over the British statesman just as he was about to accept the Franco-Neapolitan proposal, which was in consequence abandoned. He returned to Naples late in 1860 and the following year was elected to the Corsi, an edition of the latter, May 1858, when he naturalized a British subject in 1855. He took little part in parliamentary politics, but in 1876 was created senator. He was actively interested in a number of English companies operating in Italy, and was made one of the directors of the Italian Southern Railway Co.

An authority on Dante, he gave many lectures on Italian literature and history while in England; and among his writings may be mentioned a large number of articles on Italian subjects in the Encyclopædia Britannica (1857-63), and an edition of Dante's Latin lectures on Dante delivered in 1875: he co-operated with Lord Vernon in the latter's great edition of Dante's Inferno (London, 1858-1865), and he compiled a catalogue in four volumes of the duke of Devonshire's library at Chatsworth (London, 1879).

LA CALLE, a seaport of Algeria, in the arrondissement of Bona, department of Constantine, 56 m. by rail E. of Bona and 10 m. W. of the Tunisian frontier. It is the centre of the Algerian and Tunisian coral fisheries and has an extensive industry in the curing of sardines; but the harbour is small and exposed to the N.E. and W. winds. The old fortified town, now almost abandoned, is built on a rocky peninsula about 400 yds. long, connected with the mainland by a bank of sand. Since the occupation of La Calle by the French in 1836 a new town has grown up along the coast. Pop. (1906) of the town, 2774; of the commune, 4012.

La Calle from the times of its earliest records in the 16th century has been the residence of coral merchants. In the 16th century exclusive privileges of fishing for coral were granted by the crown to Agiers and the French, who first established themselves on day ago. The old town of La Calle, an island of the Biscay Basin, de France; many ruins still exist of this town. In 1677 they moved their headquarters to La Calle. The company—Compagnie d'Afrique—who owned the concession for the fishery was suppressed in 1708 on the outbreak of war between France and Algeria. In 1806 the British consul-general at Algiers obtained the right to occupy Bona and La Calle for an annual rent of £1,000; but though the money was paid for several years no practical effect was given to the agreement. The French regained possession in 1817, were expelled during the wars of 1827, when La Calle was burnt, but returned and rebuilt the place in 1836. The boats engaged in the fishery were mainly Italian, but the imposition, during the last quarter of the 19th century, of heavy taxes on all save French boats drove the foreign vessels away. For some years the industry was abandoned, but was restored on a small scale in 1903.

See Abbé Poiret, Voyage en Barbary (Paris, 1759); E. Broughton, Six Years Residence in Agiers (London, 1839) and Sir R. L. Playfair, Travels in the Footsteps of Bruce (London, 1877).
are common accomplishments among the men. The chief industry is the manufacture of coir. The various processes are entrusted to the women. The men employ themselves with boatbuilding and in conveying the island produce to the coast. The exports from the Laccadives are of the annual value of about £17,000.

History.—No data exist for determining at what period the Laccadives were first colonized. The earliest mention of them as distinguishing Maldives islands is in the narrative by Ibn Batuta, who divides the whole archipelago (Dibajat) into the Divah Kanak or Cowrie Islands (the Maldives), and the Divah Kambar or Coir Islands (the Laccadives). (See Journ. Asiat. Soc., September 1854, p. 219.) At or about this time the islanders gave the name of Mumba Mulyaka, whose grave at Androth still imparts a peculiar sanctity to that island. The kazez of Androth was in 1847 still a member of his family, and was said to be the twenty-second who has occupied the position of the direct line from the saint. This gives colour to the tradition that the name Androth took place about 1250. It is also further corroborated by the story given by the Ibn Batuta of the conversion of the Maldives, which occurred, as he heard, four generations (say one hundred and twenty years) before his visit to these islands in 1312. The Portuguese first appear on the island in May 1498, and built forts upon them, but about 1545 the natives rose upon their oppressors. The islands subsequently became a sacerdotal of the raja of Cannanore, and after the peace of Seringapatam fell into the hands of the English, and were held by them as a fief of the management of the native chief at a yearly tribute. This was often in arrear, and on this account these islands were sequestered by the British government in 1838.

LACCOLITE (Gr. λάκκος, cistern, χιλὸς, stone), in geology, the name given by Grove K. Gilbert to intrusive masses of igneous rock possessing a cake-like form, which he first described from the Henry Mountains of southern Utah. Their characteristic is that they have spread out along the bedding planes of the strata, but are not so broad and thin as the sheets or intrusive sills which, consisting usually of basic rocks, have spread over immense distances without attaining any great thickness. Laccolites cover a comparatively small area and have greater thicknesses. Typically they have a Laccad vesicular surface while their base is flat. In the Henry Mountains they are from 1 to 5 m. in diameter and range in thickness up to about 5000 ft. The cause of their peculiar shape appears to be the viscosity of the rock injected, which is usually of intermediate character and comparatively rich in alkalis, belonging to the trachytes and similar lithological types. These are much less fluid than the basalts, and the latter in consequence spread out much more readily along the bedding planes, forming thin flat-topped sills. At each side the laccolites thin out rapidly so that their upper surface slopes steeply to the margins. The strata above them which have been uplifted and bent are often cracked by extension, and as the igneous materials well into the fissures a large number of dikes is produced. At the base of the laccolite, on the other hand, the strata are flat and dikes are rare, though there may be a conduit up which the magma lass. Laccolites are generally less deeply affected by contact alteration, and great masses of them have sometimes sunk into the laccolite, where they may be partly melted and absorbed.

Gilbert obtained evidence that these laccolites were filled at depths of 7000 to 10,000 ft. and did not reach the surface, giving rise to volcanoes. From the effects on the drainage of the country it seemed probable that above the laccolites the strata swelled up in flattish eminences. Often they occur side by side in groups belonging to a single period, though all the members of each group are not strictly of the same age. One laccolite may be formed on the side of an earlier one, and compound laccolides also occur. When exposed by erosion they give rise to hills, and their appearance varies somewhat with the stage of development.

In the western part of South America laccolites agreeing in all essential points with those described by Gilbert occur in considerable numbers and present some diversity of types. Occasionally they are asymmetrical, or have one steep or vertical side while the other is gently inclined. In other cases they split into a number of sheets spreading outwards through the rocks around. But the term laccolite has also been adopted by geologists in Britain and elsewhere to designate a variety of intrusive masses not strictly identical in character with those of the Henry Mountains. Some of these rest on a curved floor, like the gabbro masses of the Cullin Hills in Skye; others are injected along a flat plane of unconformability where they pass into the rocks and bills on either side. The latter occur in the Flaxley Limestone, and are referred to as "laccolites" or "intrusion fissures." An example of the latter class is furnished by the felsite mass of the Black Hill in the Pentlands, near Edinburgh, which has followed the line between the Silurian and the Old Red Sandstone. In this instance the rocks upwards without spreading out laterally to any great extent.

The term laccolite has also been applied to many granite intrusions, such as those of Cornwall. We know from the evidence of mining that they have been used both in the making of these laccolites and the granites that slope downwards underground with an angle of twenty to thirty degrees. They have been proved also to have been injected along certain wall-marked horizons; so that although the rocks of the country have been folded in a very complicated manner the granite can often be shown to adhere closely to certain members of the stratigraphical sequence for a considerable distance. Hence it is clear that their upper surfaces are convex and gently arched, and it is conjectured that the strata must extend below them, though at a great depth, forming a floor. The definite proof of this has not been attained for no borings have penetrated the granites and reached sedimentary rocks beneath them. But in mountainous regions where there are no such valley formations, granite laccolites are exposed to view in the hill sides. These granite sills have a considerable thickness in proportion to their length, raise the rocks above them and fill them with dikes, and behave generally like typical laccolites. In a well-defined floor we may place the batholiths, bysmaliths, plutonic plugs and stocks, which have vertical margins and apparently descend to unknown depths. It has been conjectured that masses of this type might have been produced without any dependence on the outer side and absorbing it, or excavate a passage by breaking up the roof of the space they occupy while the fragments detached sink downwards and are lost in the ascending magma.

LACE (corresponding to Ital. merletto, trina; Genoese pizzo; Ger. spitzen; Fr. dentelle; Dutch kanten; Span. encajé; the English word owes something to the Fr. lassis or laces, but both are connected with the earlier Lat. laequeus; early French lace were also called passements or insertions and dentis or edgings), the name applied to ornamental open work formed of threads of flax, cotton, silk, gold or silver, and occasionally of mohair or aloe fibre, looped or plaited or twisted together by hand, (1) with a needle, when the work is distinctly known as "needlepoint lace"; (2) with bobbins, pins and a pillow or cushion, when the work is known as "pillow lace"; and (3) by steam-driven machinery, when imitations of both needlepoint and pillow laces are produced. Lace-making implies the production of transverse and fabric continuity. Without a pattern or design the fabric of lace cannot be made.

The publication of patterns for needlepoint and pillow laces dates from about the middle of the 16th century. Before that period lace described such articles as cords and narrow braids of plaited and twisted threads, used not only to fasten shoes, sleeves and corsets together, but also in a decorative manner to braid the hair, to wind round hats, and to be sewn as trimmings upon costumes. In a Harleian MS. of the time of Henry VI. and Edward IV., about 1471, directions are given for the making of "lace Bascon, lace indented, lace bordered, lace covert, a brode lace, a round lace, a thyynne lace, an open lace, lace for hattys," &c. The MS. opens with an illuminated capital letter, in which is the figure of a woman making these articles. The MS. supplies a clear description how threads in combinations of twos, threes, fours, fives, to tens and fifteens, were to be twisted and braided together and finished. Each of the semi-circular pins with which pillow lace soon afterwards was made, the hands were used, each finger of a hand serving as a peg upon which was placed a "bowys" or "bow," or little ball of thread. Each ball might be of different colour from the other. The writer of the MS. says that the first finger next the thumb shall be called A, the next B, and so on. According to the sort of cord or braid to be made, so each of the four fingers, A, B, C, D might be called into service. A "thyynne lace" might be made with three threads, and then only fingers A, B, C would be required.
LACE

“round” lace, stouter than the “thynne” lace, might require the service of four or more fingers. By occasionally dropping the use of threads from certain fingers a sort of indented lace braid might be made. But when lashes of more importance were wanted, such as a broad lace for “hatty,” the fingers on the hands of assistants were required. The smaller cords or “thynne laces,” when fastened in simple or fantastic loops along the edges of collars and cuffs, were called “purls” (see the small edge to the collar worn by Catherine de’ Medici, Pl. II. fig. 4). In another direction from which some suggestion may be derived as to the evolution of lace-making, notice should be taken of the fact that at an early period the darning of varied ornamental devices, stiff and geometric in treatment into hand-made network of small square meshes (see squares of “lacies,” Pl. I. fig. 1) became specialized in many European countries. This is held by some writers to be “opus flatorium,” or “opus arameum” (spider work). Examples of this “opus flatorium,” said to date from the 13th century exist in public collections. The productions of this darning in the early part of the 16th century came to be known as “punto a maglia quadrata” in Italy and as “lacies” in France, and through a growing demand for household and wearing linen, very much of the “lacies” was made in white threads not only in Italy and France but also in Spain. In many parts of the country, as in the northern regions, the activities changed from the early transatlantic “purlings” above mentioned made, by means of leaden bobbins or “fuxi,” and were called “merletti a piombini” (see lower border, Pl. II. fig. 3). Cut and drawn thread linen work (the latter known as “tela tirata” in Italy and as “deshiado” in Spain) were other forms of embroidery as much in vogue as the darning on net and the “purling.” The ornament of much of this cut and drawn linen work (see collar of Catherine de’ Medici, Pl. II. fig. 4), more restricted in scope than that of the darning on net, was governed by the recurrence of open squares formed by the withdrawal of the threads. Within these squares and rectangles radiating devices usually were worked by means of whipped and buttonhole stitches (Pl. fig. 5). The general effect in the linen was a succession of insertions or borders of plain or enriched reticulations, whence the name “punto a reticella” given to this class of embroidery in Italy. Work of similar style and especially that with whipped stitches was done rather earlier in the Grecian islands, which derived it from Asia Minor and Persia. The close connection of the Venetian republic with Cretan, the eastern islands, as well as its commercial relations with the East, sufficed to make an early introduction of this kind of embroidery into Venice, as well as in southern Spain. At Venice besides being called “reticella,” cut work was also called “punto tagliato.” Once fairly established as home industries such arts were quickly exported with a beauty and variety of pattern, complexity of stitch and delicacy of execution, until insertions and edgings made independently of any linen as a starting base (see first two borders, Pl. II. fig. 3) came into being under the name of “Punto in aria” (Pl. II. fig. 7). This was the first variety of Venetian and Italian needlepoint lace in the middle of the 16th century, and its appearance then almost coincides in date with that of the “merletti a piombini,” which was the earliest Italian cushion or pillow lace (see lower edging, Pl. II. fig. 3). The many varieties of needlepoint and pillow laces will be

1 The prevalence of fashion in the above-mentioned sorts of embroidery during the 16th century is marked by the number of pattern-books then published. In Venice a work of this class was issued by Alessandro Pagannino in 1527; another of a similar nature, printed by Pierre Quinty, appeared in the same year at Cologne; and La Flosse (Franciscar de broderie, façon arabeique et stylique) was published at Paris in 1544. From these early dates until the beginning of the 17th century pattern-books for embroidery in Italy, France, Germany and England were published in great abundance. The designs contained in many of those dating from the early 16th century were to be worked for costumes and hangings, as well as of scrolls, arabesques, birds, animals, flowers, foliage, herbs and grasses. So far, however, as their reproduction as laces might be concerned, the execution of complicated work was involved which none but practised lace-workers, such as those who arose a century later, could be expected to undertake.

2 A very complete account of how these conditions began and developed at Alençon, for instance, is given in Madame Despierre’s Histoire du Point d’Alençon (1886) to which is appended an interesting and annotated list of merchants, designers and makers of Point d’Alençon.

3 The picture, however, as Seguin has pointed out, was probably painted some thirty years later, and by Jean Mateys.
**FIG. 1.** - PORTION OF A COVERLET COMPOSED OF SQUARES OF "LACIS" OR DARNED NETTING, DIVIDED BY LINEN CUT-WORK BANDS. The squares are worked with groups representing the twelve months, and with scenes from the old Spanish dramatic story "Cristina" Spanish or Portuguese 16th century. (Victoria and Albert Museum.)

**Fig. 2.** - CORNER OF A BED COVER OF PILLOW-MADE LACE OF A TAPE-LIKE TEXTURE WITH CHARACTERISTICS IN THE TWISTED AND PLAITED THREADS RELATING THE WORK TO ITALIAN "MERLETTI A PIOMBINI" OR EARLY ENGLISH "BONE LACE." Possibly made in Flanders or Italy during the early part of the 17th or at the end of the 16th century. The design includes the Imperial double-headed eagle of Austria with the ancient crown of the German Empire. (Victoria and Albert Museum.)

(Figs. 4 and 6 by permission of Messrs. Braun, Clement & Co., Dornach (Alsace), and Paris.)
France and England were not far behind Venice and Flanders in making needle and pillow lace. Henry III. of France (1574-1589) appointed a Venetian, Frederic Vinciolo, pattern maker for varieties of linen needle works and laces to his court. Through the influence of this fertile designer the seeds of a taste for lace in France were principally sown. But the event which par excellence would seem to have fostered the higher development of the French art of lace-making was the aid officially given it in the following century by Louis XIV., acting on the advice of his minister Colbert. Intrigue and diplomacy were put into action to secure the services of Venetian lace-workers; and by an edict dated 1663 the lace-making centres at Alençon, Quesnoy, Arras, Reims, Sedan, Château Thierry, Loudun and elsewhere were selected for the operations of a company in aid of which the state made a contribution of 36,000 francs; at the same time the importation of Venetian, Flemish and other laces was strictly forbidden. The edict contained instructions that the lace-makers should produce all sorts of thread work, such as those done on a pillow or cushion and with the needle, in the style of the laces made at Venice, Genoa, Ragusa and other places; these French imitations were to be called "points de France." By 1671 the Italian ambassador at Paris writes, "Gallantly is the minister Colbert on his way to bring the 'lavori d'aria' to perfection." Six years later an Italian, Domenigo Contarini, alludes to the "punto in aria," "which the French can now do to admiration." The styles of design which emanated from the chief of the French lace centre, Alençon, were more fanciful and less severe than the Venetian, and it is evident that the Flemish lace-makers later on adopted many of these French patterns for their own use. The provision of French designs (fig. 24) which owes so much to the state patronage, contrasts with the absence of corresponding provision in England and was noticed early in the 18th century by Bishop Berkeley. "How," he asks, "could France and Flanders have drawn so much money from other countries for figured silk, lace and tapestry, if they had not had their academies of design?"

It is fairly evident too that the French laces themselves, known as "bisette," "gueuse," "campane" and "mignonette," were small and comparatively insignificant works, without pretence to design.
The humble endeavours of peasantry in England (which could boast of no schools of design), Germany, Sweden, Russia and Spain could not result in work of so high artistic pretension as that of France and Flanders. In the 18th century good lace was made in Devonshire, but it is only in recent years that to some extent the hand lace-makers of England and Ireland have become impressed with the necessity of well-considered designs for their work. Pillow lace making under the name of "bone lace making" was pursued in the 17th century in Buckinghamshire, Hertfordshire and Bedfordshire, and in 1724 Defoe refers to the manufacture of bone lace in which villagers were "wonderfully exercised and improved within these few years past." "Bone" lace dates from the 17th century in England and was practically the counterpart of Flemish "dentelles au fuseau," and related also to the Italian "merletti a piombini" (see Pl. fig. 10). In Germany, Barbara Uttmann, a native of Nuremberg, instructed peasants of the Harz mountains to twist and plait threads in 1361. She was assisted by certain refugees from Flanders. A sort of "purling" or imitation of the Italian "merletti a piombini" was the style of work produced then.

Lace of comparatively simple design has been made for centuries in villages of Andalusia as well as in Spanish conventual establishments. The "point d'Espagne," however, appears to have been a commercial name given by French manufacturers of a class of lace made in France with gold or silver threads on the pillow and greatly esteemed by Spaniards in the 17th century. No lace pattern-books have been found to have been published in Spain. The needle-made laces which came out of Spanish monasteries in 1530, when these institutions were dissolved, were mostly Venetian needle-made laces. The lace vestments preserved at the cathedral at Granada hitherto presumed to be of Spanish work are verified as being Flemish of the 17th century (similar in style to Pl. fig. 14). The industry is not alluded to in Spanish ordinances of the 15th, 16th or 17th centuries, but traditions which throw its origin back to the Moors or Saracens are still current in Seville and its neighbourhood, where a twisted and knotted arrangement of fine cords is often worked under the name of "Morisco" fringe, elsewhere called macramé lace. Black and white silk pillow laces, or "blondes," date from the 18th century. They were made in considerable quantity in the neighbourhood of Chantilly, and imported for mantillas by Spain, where corresponding silk lace making was started. Although after the 18th century the making of silk laces more or less ceased at Chantilly and the neighbourhood, the craft is now carried on in Normandy—at Bayeux and Caen—as well as in Auvergne, which is also noted for its simple "torcheon" laces. Silk pillow lace making is carried on in Spain, especially at Barcelona. The patterns are almost entirely imitations from 18th-century French ones of a large and free floral character. Lace-making is said to have been promoted in Russia through the patronage of the court, after the visit of Peter the Great to Paris in the early days of the 18th century. Peasants in the districts of Vologda, Balakhna (Nijni-Novgorod), Bielef (Tula) and Mzensk (Orel) make pillow laces of simple patterns. Malta is noted for producing a silk pillow lace of black or white, or red threads, chiefly of patterns in which repetitions of circles, wheels and ramifications of shapes resembling grains of wheat are the main features. This characteristic of design, appearing in white linen thread laces of similar make which have been identified as Genoese pillow laces of the early 17th century, reappears in Spanish and Paraguayan work. Pillow lace in imitation of Maltese, Buckinghamshire and Devonshire laces is made to a small extent in Ceylon, in various parts of India and in Japan. A successful effort has also been made to re-establish the industry in the island of Burano near Venice, and pillow and needlepoint lace of good design is made there.

At present the chief sources of hand-made lace are France, Belgium, Ireland and England.

France is faithful to her traditions in maintaining a lively and graceful taste in lace-making. Fashion of late years has called for more and more boldly effective laces, readily produced with both braids and cords and far less intricate needle or pillow work than was required for the dainty and smaller laces of earlier date.

In Belgium the social and economic conditions are, as they have been in the past, more conducive and more favourable than elsewhere to lace-making at a sufficiently remunerative rate of wages. The production of hand-made laces in Belgium was in 1900 greater than that of France. The principal modern needle-made lace of Belgium is the "Point de Gaze"; "Duchesse" and Bruges laces are the chief pillow-made laces; whilst "Point Appliqué" and "Plat Appliqué" are frequently the results not only of combining needle-made and pillow work, but also of using them in conjunction with machine-made net. Ireland is the best producer of that substantial looped-thread work known as crochet (see figs. 25, 26, 27), which must be regarded as a hand-made lace fabric although not classifiable as a needlepoint or pillow lace. It is also quite distinct in character from pseudo-laces, which are really embroideries with a lace-like appearance, e.g. embroideries on net, cut and embroidered cambics and fine linen. For such as these Ireland maintains a reputation in its admirable Limerick and Carrickmacross laces, made not only in Limerick and Carrickmacross, but also

Venetian, middle of the 17th century, and often called "rose-point lace," and sometimes "Point de Neige."
in Kinsale, Newry, Crossmaglen and elsewhere. The demand from France for Irish crochet is now far beyond the supply, a condition which leads not only to the rapid repetition by Irish workers of old patterns, but tends also to a gradual debasement of both texture and ornament. Attempts have been made to counteract this tendency, with some success, as the specimens of Irish crochet in figs. 25, 26 and 27 indicate.

An appreciable amount of pillow-made lace is annually supplied from Ashbourne, Derbyshire, and Northampton, but it is bought almost wholly for home use. The English laces are made almost entirely in accordance with the precedents of the 10th century—that is to say, in definite lengths and widths, as for borders, insertions and flounces, although large shaped articles, such as panels for dresses, long sleeves complete skirts, jackets, blouses, and fancifully shaped collars of considerable dimensions have of late been freely made elsewhere. To make such things entirely of lace necessitates many modifications in the ordinary methods; the English lace-workers are slow to adapt their work in the manner requisite, and hence are far behind in the race to respond to the fashionable demand. No countries succeed so well in promptly answering the variable call of fashion as France and Belgium.

As regards trade in lace, America probably buys more from Belgium than from France: France and England come next as purchasers of nearly equal quantities, after which come Russia and Italy.

The greatest amount of lace now made is that which issues from machines in England, France and Germany. The total number of persons employed in the lace industry in England in 1871 was 49,370, and in 1901 about 34,929, of whom not more than 5000 made lace by hand.

The early history of the lace-making machine coincides with that of the stocking frame, that machine having been adapted about the year 1768 for producing open-looped fabrics which had a net-like appearance. About 1786 frames for making point nets by machinery first appear at Mansfield and later at Ashbourne and Nottingham and soon afterwards modifications were introduced into such frames in order to make varieties of meshes in the point nets which were classed as figured nets. In 1808 and 1809 John Heathcoat of Nottingham obtained patents for machines for making bobbin net with a simpler and more readily produced mesh than that of the point net just mentioned. For at least thirty years thousands of women had been employed in and about Nottingham in the embroidery of simple ornament on net. In 1813 John Leavens began to improve the figured net weaving machines above mentioned, and from these the lace-making machines in use at the present time were developed. But it was the application of the celebrated Jacquard apparatus to such machines that enabled manufacturers to produce all sorts of patterns in thread-work in imitation of the patterns for hand-made lace. A French machine called the "dentellière" was devised (see La Nature for the 3rd of March 1881), and the patterns produced by it were of plaited threads. The expense, however, attending the production of plaited lace by the "dentellière" is as great as that of pillow lace made by the hand, and so the machine has not succeeded for ordinary trade purposes. More successful results have been secured by the new patent circular lace machine of Messrs. Birkin & Co. of Nottingham, the productions of which, all of simple design, cannot be distinguished from hand-made pillow lace of the same style (see figs. 57, 58, 59).

Before dealing with technical details in processes of making lace by hand or by the machine, the component parts of different makes of lace may be considered. These are governed by the ornaments or patterns, which may be so designed, as they were in the earlier laces, that the different component parts may touch one another without any intervening ground-work. But as a wish arose to vary the effect of the details in a pattern ground-works were gradually developed and at first consisted of links or ties between the substantial parts of the pattern. The bars or ties were succeeded by grounds of meshes, like nets. Sometimes the substantial parts of a pattern were outlined with a single thread or by a strongly marked raised edge of buttonhole-stitched or of plaited work. Minute fanciful devices were then introduced to enrich various portions of the pattern. Some of the heavier needle-made laces resemble low relief carving in ivory, and the edges of the relief portions are often decorated with clusters of small loops. For the most part all this elaboration was brought to a high pitch of variety and richness by French designers and workers; and French terms are more usual in speaking of details in laces. Thus the solid part of the pattern is called the toile or clothing, the links or ties are called brides, the meshed grounds are called réseaux, the outline to the edges of a pattern is called cordonnet or brodé, the insertions of fanciful devices modes, the little loops picots. These terms are applicable to the various portions of laces made with the needle, on the pillow or by the machine.

The sequence of patterns in lace (which may be verified upon referring to figs. 1 to 23) is roughly as follows. From about 1540 to 1590 they were composed of geometric forms set within squares, or of crossed and radiating line devices, resulting in a very open fabric, stiff and almost wiry in effect, without brides or réseaux. From 1590 may be dated the introduction into patterns of very conventional floral and even human and animal forms and slender scrolls, rendered in a tape-like texture, held together by brides. To the period from 1620 to 1670 belongs the development of long continuous scroll patterns with réseaux and brides, accompanied in the case of needle-made laces with an elaboration of details, e.g. cordonnet with massings of picots. Much of these laces enriched with fillings or modes was made at this time. From 1650 to 1700 the scroll patterns gave way to arrangements of detached ornamental details (as in Pl. VI. fig. 22) and about 1700 to 1760 more important schemes or designs were made (as in Pl. IV. fig. 29) into which were introduced naturalistic renderings of garlands, flowers, birds, trophies, architectural ornament and human figures. Grounds composed entirely of varieties of modes, such as in the case of the roseau rasé (Pl. V. fig. 21) were sometimes made then. From 1760 to 1800 small details consisting of bouquets, sprays of flowers, single flowers, leaves, buds, spots and such like were adopted, and sprinkled over meshed grounds, and the character of the texture was gauzy and filmy (as in figs. 40 and 42). Since that time variants of the foregoing styles of pattern and textures have been used according to the bent of fashion in favour of simple or complex ornamentation, or of stiff, compact or filmy textures.

Needlepoint Lace.—The way in which the early Venetian "punto in aria" was made corresponds with that in which needlepoint lace is now worked. The pattern is first drawn upon a piece of parchment. The parchment is then stitched to two pieces of linen. Upon the leading lines drawn on the parchment a thread is laid, and fastened through to the parchment and linen by means of stitches, thus constructing a skeleton thread pattern (see left-hand part of fig. 30).

Those portions which are to be represented as the "clothing" or toile are usually worked as indicated in the enlarged diagram (fig. 29), and then edged as a rule with buttonhole stitching (fig. 28). Between these toile portions of the pattern are worked ties (brides) or meshes (réseaux), and thus the various parts united into one fabric are wrought on to the face of the parchment pattern and reproducing it (see right-hand part of fig. 30). A knife is

LACE

ground and the ground of meshes another variety of grounding (réseau rosace) was used in certain Alençon designs. This ground consisted of buttonhole-stitched skeleton hexagons within each of which was worked a small hexagon of toile connected with the upper surrounding hexagon by means of six little ties or brides (Pl. V, fig. 21). Lace with this particular ground has been called "Argentella," and some writers have thought that it was a specialty of Genoese or Venetian work. But the character of the work and the style of the floral patterns are those of Alençon laces. The industry at Argentan was virtually an offshoot of that nurtured at Alençon, where "lacis," "cut work" and "vénin" (work on parchment) had been made for years before the well-developed needle-made "point d’Alençon" came into vogue under the favouring patronage of the state-aided lace company mentioned as having been formed in 1665.

Madame Despierre in her Histoire du point d’Alençon gives an interesting and trustworthy account of the industry.

In Belgium, Brussels has acquired some celebrity for needle-made laces. These, however, are chiefly in imitation of those made at Alençon, but the toile is of less compact texture and sharpness in definition of pattern. Brussels needlepoint lace is often worked with meshed grounds made on a pillow, and a plain thread is used as a cordonnets for their patterns instead of a thread overcast with buttonhole stitches as in the French needlepoint laces. Note the bright sharp outline to the various ornamental details in Pl. V, fig. 20b.

Needlepoint lace has also been occasionally produced in

Fig. 32.—Border of Needlepoint Lace made in France about 1740–1750, the clear hexagonal mesh ground, which is compactly stitched, being usually regarded as characteristic of the point de France made at Argentan.

Fig. 33.—Shirt decorated with Insertions of Flat Needlepoint Lace. (English, 17th century. Victoria and Albert Museum.)
Fig. 18.—CHARLES GASPARD GUILLAUME DE VINTI MILLE, WEARING LACE SIMILAR IN STYLE OF DESIGN SHOWN IN FIG. 19. About 1730.

Fig. 19.—PORTION OF FLOUNCE, NEEDLEPOINT LACE COPIED AT THE BURANO LACE SCHOOL FROM THE ORIGINAL OF THE SO-CALLED "POINT DE VENISE À BRIDES PICOTÉES."

17th century. Formerly belonging to Pope Clement XIII, but now the property of the queen of Italy. The design and work, however, are indistinguishable from those of important flounces of "Point de France." The pattern consists of repetitions of two vertically-arranged groups of fantastic pine-apples and vases with flowers, intermixed with bold rococo bands and large leaf devices. The hexagonal meshes of the ground, although similar to the Venetian "brides picotées," are much akin to the button-hole stitched ground of "Point d'Argentan." (Victoria and Albert Museum.)

A.—A LAPPET OF "POINT DE VENISE À RÉSEAU."

The conventional character of the pseudo-leaf and floral forms contrasts with that of the realistic designs of contemporary French laces. Italian. Early 18th century.

B.—A LAPPET OF FINE "POINT D'ALENÇON."

Louis XV. period. The variety of the fillings of geometric design is particularly remarkable in this specimen, as is the button-hole stitched cordonnet or outline to the various ornamental forms.

Fig. 23.—JABOT OR CRAVAT OF PILLOW-MADE LACE OF FANTASTIC FLORAL DESIGN, THE GROUND OF WHICH IS COMPOSED OF LITTLE FLOWERS AND LEAVES ARRANGED WITHIN SMALL OPENWORK VERTICAL STRIPS. Brussels. 18th century. (Victoria and Albert Museum.)
England. Whilst the character of its design in the early 17th century was rather more primitive, as a rule, than that of the contemporary Italian, the method of its workmanship is virtually the same and an interesting specimen of English needle-made lace inset into an early 17th-century shirt is illustrated in fig. 33. Specimens of needle-made work done by English school children may be met with in samplers of the 17th and 18th centuries. Needlepoint lace is successfully made at Youghal, Kenmare and New Ross in Ireland, where of late years attention has been given to the study of designs for it. The lace-making school at Burano near Venice produces hand-made laces which are, to a great extent, careful reproductions of the more celebrated classes of point laces, such as "punto in aria," "rose point de Venise," "point de Venise à réseau," "point d'Alençon," and others. Some good needlepoint lace is made in Bohemia and elsewhere in the Austrian empire.

Pillow-made Lace.—Pillow-made lace is built upon no substructure corresponding with a skeleton thread pattern such as is used for needlepoint lace, but is the representation of a pattern obtained by twisting and plaiting threads.

These patterns were never so strictly geometric in style as those adopted for the earliest point lace making from the antecedent cut linen and drawn thread embroideries. Curved forms, almost at the outset of pillow lace, seem to have been found easy of execution (see lower border, Pl. II. fig. 3); its texture was more lissom and less crisp and wiry in appearance than that of contemporary needle-made lace. The early twisted and plaited thread laces, which had the appearance of small cords merging into another, were soon succeeded by laces of similar make but with flattened and broader lines more like fine braids or tapes (Pl. I. fig. 2, and Pl. fig. 10). But pillow laces of this tapey character must not be confused with laces in which actual tape or braid is used. That peculiar class of lace-work does not arise until after the beginning of the 17th century when the weaving of tape is said to have commenced in Flanders. In England this sort of tape-lace dates no farther back than 1747, when two Dutchmen named Lanfort were invited by an English firm to set up tape looms in Manchester.

The process by which lace is made on the pillow is roughly and briefly as follows. A pattern is first drawn upon a piece of paper or parchment. It is then pricked with holes by a skilful "pattern pricker," who determines where the principal pins shall be stuck for guiding the threads. This pricked pattern is then fastened to the pillow. The pillow or cushion varies in shape in different countries. Some lace-makers use a circular pad, backed with a flat board, in order that it may be placed upon a table and easily moved. Other lace-workers use a well-stuffed round pillow or short bolster, flattened at the two ends, so that they may hold it conveniently on their laps. From the upper part of pillow with the pattern fastened on it hang the threads from the bobbins. The bobbin threads thus hang across the pattern. Fig. 34 shows the commencement, for instance, of a double set of three-thread plaitings. The compact portion in a pillow lace has a woven appearance (Fig. 35).

About the middle of the 17th century pillow lace of formal scroll patterns somewhat in imitation of those for point lace was made, chiefly in Flanders. The earlier of these had grounds of ties or brides and was often called "point de Flandres" (Pl. fig. 14) in contradistinction to scroll patterns with a mesh ground, which were called "point d'Angleterre" (Pl. fig. 16). Into Spain and France much lace from Venice and Flanders was imported as well as into England, where from the 16th century the manufacture of the simple pattern "bone lace" by peasants in the midland and southern counties was still being carried on. In Charles II.'s time its manufacture was threatened with extinction by the preference given to the more artistic and finer Flemish laces. The importation of the latter was accordingly prohibited. Dealers in Flemish lace sought to evade the prohibitions by calling certain of their laces "point d'Angleterre," and smuggling them into England. But smuggling was made so difficult that English dealers were glad to obtain the services of Flemish lace-makers and to induce them to settle in England. It is from some such cause that the better 17th- and 18th-century English pillow laces bear resemblance to pillow laces of Brussels, of Mechlin and of Valenciennes.

As skill in the European lace-making developed soon after the middle of the 17th century, patterns and particular plaitings came to be identified with certain localities. Mechlin, for instance, enjoyed a high reputation for her productions. The chief technical features of this pillow lace lie in the plaiting of the meshes, and the outlining of the clothing or toile with a thread cordonnet. The ordinary Mechlin mesh is hexagonal in shape. Four of the sides are of double twisted threads, two are of four threads plaited three times (fig. 39).

In Brussels pillow lace, which has greater variety of design, the mesh is also hexagonal; but in contrast with the Mechlin mesh whilst four of its sides are of double-twisted threads the other two are of four threads plaited four times (fig. 41). The finer specimens of Brussels lace are remarkable for the fidelity and grace with which the botanical forms in many of its patterns are rendered (Pl. VI. fig. 23). These are mainly reproductions or adaptations of designs for point d'Alençon, and the soft quality imparted to them in the texture of pillow-made lace contrasts with the harder and more crisp appearance in needlepoint.
lace. An example of dainty Brussels pillow lace is given in fig. 42. In the Brussels pillow lace a delicate modelling effect

![Fig. 42.—Portion of a Wedding Veil, 7 ft. 6 in. X 6 ft. 6 in. of Pillow-made Lace, Brussels, late 18th century. The design consists of light leafy garlands of orange blossoms and other flowers daintily festooned. Little feathery spirals and stars are powdered over the ground, which is of Brussels vrai réseau. In the centre upon a more open ground of pillow-made hexagonal brides is a group of two birds, one flying towards the other which appears ready to take wing from its nest: an oval frame containing two hearts pierced by an arrow, and a hymeneal torch. Throughout this veil is a profusion of pillow renderings of various modes, the réseau rosace, star devices, &c. The ornamental devices are partly applied and partly worked into the ground (Victoria and Albert Museum).](image1)

is often imparted to the close textures of the flowers by means of pressing them with a bone instrument which gives concave shapes to petals and leaves, the edges of which consist in part of slightly raised cordonnet of compact plaited work.

Honiton pillow lace resembles Brussels lace, but in most of the English pillow laces (Devonshire, Buckinghamshire, Bedfordshire) the réseau is of a simple character (fig. 43). As a rule, English lace is made with a rather coarser thread than that used in the older Flemish laces. In real Flemish Valenciennes lace there are no twisted sides to the mesh; all are closely plaited (fig. 44) and as a rule the shape of the mesh is diamond but without the openings as shown in fig. 44. No outline or cordonnet to define the pattern is used in Valenciennes lace (see fig. 45). Much lace of the Valenciennes type (fig. 54) is made at Ypres. Besides these distinctive classes of pillow-like laces, there are others in which equal care in plaiting and twisting threads is displayed, though the character of the design is comparatively simple, as for instance in ordinary pillow laces from Italy, from the Auvergne, from Buckinghamshire, or rude and primitive as in laces from Crete, southern Spain and Russia. Pillow-lace-making in Crete is now said to be extinct. The laces were made chiefly of silk. The patterns in many specimens are outlined with one, two or three bright-coloured silken threads. Uniformity in simple character of design may also be observed in many Italian, Spanish, Bohemian, Swedish and Russian pillow laces (see the lower edge of fig. 46).

**Guipure.**—This name is often applied to needlepoint and pillow laces in which the ground consists of ties or brides, but it more properly designates a kind of lace or “passemanterie,” made with gimp of fine wires whipped round with silk, and with cotton thread. An earlier kind of gimp was formed with “Cartisane,” a little strip of thin parchment or vellum covered with silk, gold or silver thread. These stiff gimp threads, formed into a pattern, were held together by stitches worked with the needle. Gold and silver thread laces have been usually made on the pillow, though gold thread has been used with fine effect in 17th-century Italian needlepoint laces.

**Machine-made Lace.**—We have already seen that a technical peculiarity in making needlepoint lace is that a single thread and needle are alone used to form the pattern, and that the buttonhole stitch and other loopings which can be worked by means of a needle and thread mark a distinction between lace made in this manner and lace made on the pillow. For the process of pillow lace making a series of threads are in constant employment, plaited and twisted the one with another. A buttonhole stitch is not producible by it. The Leavers lace machine does not make either a buttonhole stitch or a plait. An essential principle of this machine-made work is that the threads are twisted together as in stocking. The Leavers lace machine is that generally in use at Nottingham and Calais. French ingenuity has developed improvements in this machine whereby laces of delicate thread are made; but as fast as France makes an improvement England follows with another, and both countries virtually maintain an equal position in this branch of industry. The number of threads brought into operation in a Leavers machine is regulated by the pattern to be produced, the threads being of two sorts, beam or warp threads.
and bobbin or weft threads. Upwards of 880 are sometimes used, sixty pieces of lace being made simultaneously, each piece requiring 148 threads—100 beam threads and 48 bobbin threads. The ends of both sets of threads are fixed to a cylinder upon which as the manufacture proceeds the lace becomes wound.

Fig. 46.—Border to a Cloth. The wide part bearing the double-headed eagle of Russia is of drawn thread embroidery; the scalloped edging is of Russian pillow-made lace, though the style of its pattern is often seen in pillow laces made by peasants in Danubian provinces as well as in the south of Spain.

The supply of the beam or warp threads is held upon reels, and that of the bobbins or weft threads is held in bobbins. The beam or warp thread reels are arranged in frames or trays beneath the stage, above which and between it and the cylinder the twisting of the bobbin or weft with beam or warp threads takes place. The bobbins containing the bobbin or weft threads are flattened in shape so as to pass conveniently between the stretched beam or warp threads. Each bobbin can contain about 120 yds. of thread. By most ingenious mechanism varying degrees of tension can be imparted to warp and weft threads as required. As the bobbins or weft threads pass like pendulums between the warp threads the latter are made to oscillate, thus causing them to become twisted with the bobbin threads. As the twistings take place, combs passing through both warp and weft threads compress the twistings. Thus the texture of the clothing or toile in machine-made lace may generally be detected by its ribbed appearance, due to the compressed twisted threads. Figs. 47 and 48 are intended to show effects obtained by varying the tensions of weft and warp threads. For instance, if the weft, as threads b, b, b, b in fig. 47, be tight and the warp thread slack, the warp thread a will be twisted upon the weft threads. But if the warp thread a be tight and the weft threads b, b, b, b be slack, as in fig. 48, then the weft threads will be twisted on the warp thread. At the same time the twisting in both these cases arises from the conjunction of movements given to the two sets of threads, namely, an oscillation or movement from side to side of the beam or warp threads, and the swinging or pendulum-like movement of the bobbin or weft threads between the warp threads. Fig. 49 is a diagram of a sectional elevation of a lace machine representing its more essential parts. E is the cylinder or beam upon which the lace is rolled as made, and upon which the ends of both warp and weft threads are fastened at starting. Beneath are w, w, w, a series of trays or beams, one above the other, containing the reels of the supplies of warp threads; c, c represent the slide bars for the passage of the bobbin b with its thread from k to k, the landing bars, one on each side of the rank of warp threads; s, t are the combs which take it in turns to press together the twistings as they are made. The combs come away clear from the threads as soon as they have pressed them together and fall into positions ready

Fig. 49.—Section of Lace Machine.

Fig. 50.—Machine-made Lace in imitation of 16th-century Needlepoint "Reticella" Lace.
LACE

to perform their pressing operations again. The contrivances for giving each thread a particular tension and movement at a certain time are connected with an adaptation of the Jacquard system of pierced cards. The machine lace pattern drafter has to calculate how many holes shall be punched in a card, and to determine the position of such holes. Each hole regulates the mechanism for giving movement to a thread. Fig. 54 displays a piece of hand-made Valenciennes (Ypres) lace and fig. 55 a corresponding piece woven by the machine. The latter shows the advantage that can be gained by using very fine gauge machines, thus enabling a very close imitation of the real lace to be made by securing a very open and clear réseau or net, such as would be made on a coarse machine, and at the same time to keep the pattern fine and solid and standing out well from the net, as is the case with the real lace, which cannot be done by using a coarse gauge machine. In this example the machine used is 16 point (that is 32 carriages to the inch), and the ground is made half gauge, that is 8 point, made lace. In another branch of lace-making by machinery, mechanical ingenuity, combined with chemical treatment, has led to surprising results (figs. 53 and 50). Swiss, German and other manufacturers use machines in which a principle of the sewing-machine is involved. A fine silken tissue is thereby enriched with an elaborately raised cotton or thread embroidery. The whole fabric is then treated with chemical mordants which, whilst dissolving the silky web, do not attack the cotton or

Fig. 51.—Border of Machine-made Lace in the style of 17th-century Pillow Guipure Lace.

and the weaving is made the full gauge of the machine, that is 16 point. Fig. 56 gives other examples of hand- and machine-made Valenciennes lace. The machine-made lace (b) imitating the real (a) is made on a 14-point machine (that is 28 carriages to the inch), the ground being 7 point and the pattern being full gauge or 14 point. Although the principle in these examples of machine work is exactly the same, in so far that they use half gauge net and full gauge clothing to produce the contrast as mentioned above, the fabrication of these two examples is quite different, that in fig. 55 being an example of tight bobbins or weft, and slack warp threads as shown in fig. 47. Whereas the example in fig. 56 is made with slack bobbins or weft threads and tight warp threads as in fig. 48. In fig. 57 is a piece of hand-made lace of ousthread, very similar to much Cluny lace made in the Auvergne and to the Buckinghamshire "Maltese" lace. Close to it are specimens of lace (figs. 58 and 59) made by the new patent circular lace machine of Messrs Birkin of Nottingham. This machine although very slow in production actually reproduces the real lace, at a cost slightly below that of the hand-

Museum in London, the Musée des Arts Décroisifs in Paris, and museums at Lyons, Nuremberg, Berlin, Turin and elsewhere.

Fig. 61.—Machine-made Lace in imitation of 17th-century Needlepoint Lace, "Gros point de Venise."

In such places the opportunity is presented of tracing in chronological sequence the stages of pattern and texture development.

Literature.—The literature of the art of lace-making is considerable. The series of 16th- and 17th-century lace pattern-books, of which the more important are perhaps those by F. Vincio (Paris, 1557), Cesare Vecello (Venice, 1592), and Isabella Cattaneo Parasole (Venice, 1600), are to mention several kindred works of earlier and later date published in Germany and the Netherlands, supplies a large field for exploration. Signor Ongania of Venice published a limited number of facsimiles of the majority of such works. M. Alvin of Brussels issued a brochure in 1863 upon these patterns, and in the same year the marquis Girolamo d'Adda contributed two bibliographical essays upon the same subject to the Gazette des Beaux-Arts (vol. xiv. p. 341 seq., and vol. xvii. p. 421 seq.). In 1864 Cavallere A. Merli wrote a pamphlet (with illustrations) entitled Origine ed uso delle trine a fio di rete; Mons F. de Fertault compiled a brief and rather fanciful Histoire de la dentelle in 1843, in which he reproduced selected statements to be found in Diderot's Encyclopédie, subsequently quoted by Roland de la Platière. The first Report of the Department of Practical Art (1853) contains a "Report on Cotton Print Works and Machine-Making," by Octavius Hudson, and in the first Report of the Department of Science and Art are "Report upon the International Exhibitions of 1851 (London) and 1857 (Paris)," by M. Aubry, Mrs Palliser and others contain information concerning lace-making. The most important work first issued upon the history of lace-making by Mrs Bury is "A Contribution to the History of Lace."

In this work the history is treated rather from an antiquarian than a technical point of view; and wardrobe accounts, inventories, state papers, fashionable journals, diaries, plays, poems, have been laid under contribution with surprising diligence. A new edition published in 1902 presents the work as entirely revised, rewritten and enlarged under the editorship of M. Jourdain and Alice Dryden. In 1873 the Arundel Society brought out Ancient Needle-work and Lace, a folio volume of permanently printed photographs taken from some of the finest specimens of ancient lace collected for the International Exhibition of 1874. These were accompanied by a brief history of lace, written from the technical aspect of the art, by Alan S. Cole. At the same time appeared a bulky imperial 4to volume by Seguin, entitled La Dentelle, illustrated with wood-cuts and fifty photo-typographical plates. Seguin divides his work into four sections. The first is devoted to a sketch of the origin of lace; the second deals with pillow laces, bibliography of lace and a review of sumptuary edicts; the third relates to needle-made lace; and the fourth contains an account of places where lace has been and is made, remarks upon commerce in lace, and upon the industries connected with it. In sufficient conclusive evidence Seguin accords to France the palm for having excelled in producing practically all the richer sorts of laces, notwithstanding that both before and since the publication of his otherwise valuable work, many of them have been identified as being Italian in origin. Descriptive catalogues are issued by the lace collectors at South Kensington Museum, at the Science and Art Museum, Dublin, and at the Industrial Museum, Nuremberg. In 1881 a series of four Cantor lectures on the art of lace-making were delivered before the Society of Arts by Alan S. Cole.

A Technical History of the Manufacture of Venetian Laces, by G. M. Urbaní de Ghettof, with plates, was translated by Lady Lever and published at Venice by Signor Ongania. The History of Machine-wrought Hosiery and Lace-Making (London, 1869), by Felkin, has already been referred to. There also is a technological essay upon lace made by machinery, with diagrams of lace stitches and descriptions (Technologische Studien über Stickereien, Leipzig, 1878), by Hugo Libald. In 1844, Madame de Lépinay, Paris, published a History of Point d'Alençon, written by Madame G. Despres, which gives a close and interesting account of the industry, together with a list, compiled from local records, of makers and dates. La Manufacture and lace-making, written by Madame F. de Dampont-Dornach (Alençon), is a detailed and exhaustive study of embroidery, knitting, crocheting, knitting, netting and most of the essential stitches for needlepoint lace. It is well illustrated with wood-cuts and process blocks. An exhaustive history of Italian lace-making is given in a series of reports (Veneto, Lombardia, Sicilia, etc.) by Davidoff, published at Leipzig, 1895. Russian lace is particularly pillow-work with rather heavy thread, and upwards of eighty specimens are reproduced by photo-lithography in this book. A short account of the best-known varieties of Point and Pillow Lace, by A. M. S. (London, 1899), is illustrated with typical specimens of Italian, Flemish, French and English laces, as well as with magnified details of lace, enabling any one to identify the plaits, the twist and loops of threads in the actual making of the fabric.—L'Industrie.
LACE-BARK TREE—LA CHAISE-DIEU

48

des tulles et dentelles mécaniques dans le Pas de Calais, 1815-1900, by Henri Hénerton (Paris, 1900), is an important volume of over 600 pages of letterpress, interspersed with abundant process blocks of the several kinds of machine nets and laces made at Calais since 1815. It opens with a portrait of the machine laces and their introduction of which is now almost extinct. The book was sold for the benefit of a public subscription towards the erection of a statue in Calais to Jacquard, the inventor of the apparatus by means of which all the machine patterns were woven. It is of some importance to note that machine net and lace-making at Calais owe their origin to Englishmen, amongst whom le sieur R. Webster arrived at St Pierre-les-Calais in December, 1816, venant d'Angleterre, est l'un des premiers qui ont été dans l'art de la fabrique de tulle, &c. Lace-making in the Midlands: Past and Present, by C. C. Channer and M. E. Roberts (London, 1900) upon the lace-making industry in Buckinghamshire, Bedfordshire and Northamptonshire contains accounts of lace-making in these counties until the 17th century and to the present time. Musée rétrospectif. Dentelles à la mode universelle internationale de 1900 à Paris. Rapport de Mons. E. Lefebre contains several good illustrations, especially of important specimens of Point de France of the 17th and 18th centuries. Le Point de France and les dentelles a l'XIIE et au XVIIIe siècle, by Madame Laurence de Laprade (Paris, 1905), brings together much hitherto scattered information throwing light upon operations in many localities in France where the industry has been carried on for considerable periods. The book is well and usefully illustrated. See also Irische Spitzen (20 half-tone plates), with a short historical introduction by Zeno S. Cole (Sheffield, 1902); Pileen Lace, a practical handbook by Elizabeth Mincoff and Margaret S. Marriage (London, 1907); The Art of Bobbin Lace, a practical text-book of workmanship, &c., by Louisa Tebbs (London, 1907); Antique lace italienne, by Pierre Ricci (Paris, 1902). L'Art du Liser, les Centuries of Lace, by Mrs John Hungerford Pollen (London and New York, 1908), very fully illustrated.

LACE-BARK TREE, a native of Jamaica, known botanically as Lagetta linteria, from its native name lagetto. The inner bark consists of numerous concentric layers of interlacing fibres resembling in appearance lace. Collars and other articles have been made of the fibre, which is also used in the manufacture of whips, &c. The tree belongs to the natural order Thymelaeaceae, and is grown in hothouses in Britain.

LACEDAEMON, in historical times an alternative name of Laconia (q.v.). Homer uses only the former, and in some passages seems to denote by it the Achaean citadel, the Therapnae of later times, in contrast to the lower town Sparta (G. Gilbert, Studien zur altertumlichen Geschichte, Göttingen, 1872, p. 34 foll.). It is described by the epithets κόλας (hollow) and κηρώσσω (spacious or hollow), and is probably connected etymologically with λάκκος, lacsus, any hollow place. Lacedaemon is now the name of a separate department, which had in 1907 a population of 87,106.

LACÉPÈDE, BERNARD GERMAIN ÉTIENNE DE LA VILLE, COMTE DE (1756-1825), French naturalist, was born at Agen in Guienne on the 26th of December 1756. His education was carefully conducted by his father, and the early perusal of Buffon's Natural History awakened his interest in that branch of study, which absorbed his chief attention. His leisure he devoted to music, in which, besides becoming a good performer on the piano and organ, he acquired considerable mastery of composition, two of his operas (which were never published) meeting with the high approval of Gluck; in 1781-1785 he also brought out in two volumes his Poétique de la musique. Meanwhile he wrote two treaties, Essai sur l'électricité (1751) and Physique générale et particulière (1782-1784), which gained him the friendship of Buffon, who in 1785 appointed him sub-demonstrator in the Jardin du Roi, and proposed to him to become the continuator of his Histoire naturelle. This continuation was published under the titles Histoire des quadrupèdes vivants et des serpents (1789-1794) and Histoire naturelle des poissons (1786-1789). After the Revolution Lacépède became a member of the legislative assembly, but during the Reign of Terror he left Paris, his life having become endangered by his disapproval of the massacres. When the Jardin du Roi was reorganized as the Jardin des Plantes, Lacépède was appointed to the chair allocated to the study of reptiles and fishes. In 1798 he published the first volume of Histoire naturelle des poissons, the fifth volume appearing in 1803; and in 1804 appeared his Histoire des cétox... From this period till his death he took in politics prevented him making any further contribution of importance to science. In 1799 he became a senator, in 1801 president of the senate, in 1803 grand chancellor of the legion of honour, in 1804 minister of state, and at the Restoration in 1819 he was created a peer of France. He died at Épinay on the 6th of October 1825. During the latter part of his life he wrote Histoire générale physique et civile de l'Europe, published posthumously in 18 vols., 1826.

A collected edition of his works on natural history was published in 1826.

LACEWING-FLY, the name given to neuropterous insects of the families Hemerobiidae and Chrysopidae, related to the antlions, scorpion-flies, &c., with long filiform antennæ, longish bodies and two pairs of large similar richly veined wings. The larvae are short grubs beset with hair-tufts and tubercles. They feed upon Aphiidae or "green fly" and cover themselves with the emptied skins of their prey. Lacewing-flies of the genus Chrysopa are commonly called golden-eye flies.

LA CHAISE, FRANÇOIS DE (1624-1709), father confessor of Louis XIV., was born at the château of Aix in Forez on the 25th of August 1624, being the son of Georges d'Aix, seigneur de la Chaise, and of Renée de Rochefort. On his mother's side he was a grand-nephew of Pierre Coton, the confessor of Henry IV. He became a novice of the Society of Jesus before completing his studies at the university of Lyons, where, after taking the final vows, he lectured on philosophy to students attracted by his fame from all parts of France. Through the influence of Camille de Villeroi, archbishop of Lyons, Pére de la Chaise was nominated in 1674 confessor of Louis XIV., who intrusted him during the lifetime of Harlay de Champvallon, archbishop of Paris, with the administration of the ecclesiastical patronage of the crown. The confessor united his influence with that of Madame de Maintenon to induce the king to abandon his liaison with Madame de Montespan. More than once at Easter he is said to have had a convenient illness which dispensed him from granting absolution to Louis XIV. With the fall of Madame de Montespan and the ascendance of Madame de Maintenon his influence vastly increased. The marriage between Louis XIV. and Madame de Maintenon was celebrated in his presence at Versailles, but there is no reason for supposing that the subsequent coolness between him and Madame de Maintenon arose from his insistence on secrecy in this matter. During the long strife over the temporalities of the Gallican Church between Louis XIV. and Innocent XI. Pére de la Chaise supported the royal prerogative, though he used his influence at Rome to prevent the papal interposition. He must not be held largely responsible for the revocation of the Edict of Nantes, but not for the brutal measures applied against the Protestants. He exercised a moderating influence on Louis XIV.'s zeal against the Jansenists, and Saint-Simon, who was opposed to him in most matters, does full justice to his humane and honourable character. Pére de la Chaise had a lasting and unalterable affection for Fénelon, which remained unchanged by the papal condemnation of the Maximes. In spite of falling faculties he continued his duties as confessor to Louis XIV. to the end of his long life. He died on the 20th of January 1709. The cemetery of Père-la-Chaise in Paris stands on property acquired by the Jesuits in 1826, and not, as is often stated, on property personally granted to him.

See R. Chanteleau, Le Père de la Chaise, Études d'histoire religieuse (Paris and Lyons, 1859).

LA CHAISE-DIEU, a town of central France, in the department of Haute Loire, 29 m. N.N.W. of Le Puy by rail. Pop. (1906) 1203. The town, which is situated among fir and pine woods, 3500 ft. above the sea, preserves remains of its ramparts and some houses of the 14th and 15th centuries, but owes its celebrity to a church, which, after the cathedral of Clermont-Ferrand, is the most remarkable Gothic building in Auvergne. The west façade, approached by a flight of steps, is flanked by two massive towers. The nave and aisles are of equal height and are separated from the choir by a stone rood screen. The
choir, terminating in an apse with radiating chapel, contains the fine tomb and statue of Clement VI., carved stalls and some admirable Flemish tapestries of the early 16th century. There is a ruined cloister on the south side. The church, which dates from the 14th century, was built at the expense of Pope Clement VI., and belonged to a powerful Benedictine abbey founded in 1043. There are spacious monastic buildings of the 18th century. The abbey was formerly defended by fortifications, the chief survival of which is a lofty rectangular keep to the south of the choir. Trade in timber and the making of lace chiefly occupy the inhabitants of the town.

**LA CHALOTAIS, LOUIS RENÉ DE CARADEUDE DE (1701–1785), French jurist, was born at Rennes, on the 6th of March 1701. He was for 60 years procureur général at the parliament of Brittany. He was an ardent opponent of the Jesuits; he drew up in 1761 for the parliament a memoir on the constitutions of the Order, which did much to secure its suppression in France; and in 1763 published a remarkable "Essay on National Education," in which he proposed a programme of scientific studies as a substitute for those taught by the Jesuits.

This year began the conflict between the Estates of Brittany and the king, in the form of a d'Aligoullon Affair (1764). The Estates refused to vote the extraordinary impoiments demanded by the governor in the name of the king. La Chalotais was the personal enemy of d'Aiguillon, who had served him an ill turn with the king, and when the parliament of Brittany sided with the Estates, he took the lead in its opposition. The parliament forbade by decrees the levy of impoiments to which the Estates had not consented. The king annulling these decrees, all the members of the parliament but twelve resigned (October 1764 to May 1765). The government considered La Chalotais one of the authors of this affair. At this time the secretary of state who administered the affairs of the province, Louis Philippeaux, duc de la Vrillière, comte de Saint-Florentin (1705–1777), received two anonymous and abusive letters. La Chalotais was suspected of having written them, and three experts in handwriting declared that they were by him. The government therefore arrested him, his son and four other members of the parliament. The arrest made a great sensation. There was much talk of "despotism." Voltaire stated that the procurer général, in his prison of Saint Malo, was accused, for days on end, to write his defence with a toothpick dipped in vinegar—which was apparently pure legend; but public opinion all over France was strongly aroused against the government. On the 16th of November 1765 a commission of judges was named to take charge of the trial. La Chalotais maintained that the trial was illegal; being procureur général he claimed the right to be judged by the parliament of Rennes, or failing this by the parliament of Bordeaux, according to the custom of the province. The judges did not dare to pronounce a condemnation on the evidence of experts in handwriting, and at the end of a year, things remained where they were at the first. Louis XV. then decided on a sovereign act, and brought the affair before his council, which without further formality decided to send the accused into exile. That expedient but increased the popular agitation; *philosophes*, members of the parliament, patriot Bretons and Jansenists all declared that La Chalotais was the victim of the personal hatred of the duc d'Aiguillon and of the Jesuits. The government was at last gaveway, and consented to recall the members of the parliament of Brittany who had resigned. This parliament, when it met again, after the formal accusation of the duc d'Aiguillon, demanded the recall of La Chalotais. This was accorded in 1775, and La Chalotais was allowed to transmit his office to his son. In this affair public opinion showed itself stronger than the absolutism of the king. The opposition to the royal power gained largely through it, and it may be regarded as one of the preludes to the revolution of 1789. La Chalotais, who was personally a violent, haughty and unsympathetic character, died at Rennes on the 12th of July 1785.

See, besides the *Complètes-Rendus des Constitutions des Jésuites* and the *Essai d'éducation nationale*, the *Mémoires de la Chalotais* (3 vols., 1766–1767). Two works containing detailed bibliographies are

Marion, *La Bretagne et le duc d'Angoult* (Paris, 1893), and B. Pouquet, *Le Duc d'Angoult et La Chalotais* (Paris, 1901). See also a controversy between these two authors in the *Bulletin critique* for 1902.

**LA CHARITÉ**, a town of central France in the department of Nièvre, on the right bank of the Loire, 17 m. N.W. of Nevers on the Paris-Lyon-Méditérranée railway. Pop. (1906) 3990. La Charité possesses the remains of a fine Romanesque basilica, the church of Sainte-Croix, dating from the 11th and early 12th centuries. The plan consists of a nave, rebuilt at the end of the 17th century, transept and choir with ambulatory and side aisles. Surrounding the transept is an octagonal tower of one story, and a square Romanesque tower ofouches between flanks the main portal. There are ruins of the ramparts, which date from the 14th century. The manufacture of hosiers, boots and shoes, files and iron goods, lime and cement and woolen and other fabrics are among the industries; trade is chiefly in wood and iron.

La Charité owes its celebrity to its priory, which was founded in the 8th century and reorganized as a dependency of the abbey of Cluny in 1052. It became the parent of many priories and monasteries, some of them in England and Italy. The possession of the town was hotly contested during the wars of religion of the 16th century, at the end of which its fortifications were dismantled.

**LA CHAUSSÉE, PIERRE CLAUDE NIVELLE DE (1692–1754), French dramatist, was born in Paris in 1692. In 1731 he published an *Épître à Cho*, a didactic poem in defence of Lériget de la Faye in his dispute with Antoine Houdart de la Motte, who had maintained that verse was useless in tragedy. La Chaussée was forty years old before he produced his first play, *La Fausse Antipathie* (1734). His second play, *Le Préjugé à la mode* (1735) turns on the fear of incurring ridicule felt by a man in love with his own wife, a prejudice dispelled in France, according to La Harpe, by La Chaussée's comedy. *L'École des ames* (1737) followed, and, after an unsuccessful attempt at tragedy in *Maximinius*, he returned to comedy in *LA MAISON DE VILLIAMS* (1741). In *Milanise* the type known as *comédie larmoyante* is fully developed. Comedy was no longer to provoke laughter, but tears. The innovation consisted in destroying the sharp distinction then existing between tragedy and comedy in French literature. Indications of this change had been already offered in the work of Marivaux, and La Chaussée's plays led naturally to the domestic drama of Diderot and of Sedaine. The new method found bitter enemies. Alexis Piron nicknames the author "le Rêvend Père Chaussée," and ridiculed him in one of his most famous epigrams. Voltaire maintained that the *comédie larmoyante* was a proof of the inability of the author to produce either of the recognized kinds of drama, though he himself produced a play of similar character in *L'Enfant prodigue*. The hostility of the critics did not prevent the public from shedding tears nightly over the sorrows of La Chaussée's heroine. *L'École des mères* (1744) and *La Gouvernante* (1747) form, with those already mentioned, the best of his work. The strict moral aims pursued by La Chaussée in his plays seem hardly compatible with the tone of his other works. The idea of the same gay society as did the comte de Caylus and contributed to the *Recueils de ces messieurs*, La Chaussée died on the 14th of May 1754. Villemain said of his style that he wrote prosaic verses with purity, while Voltaire, usually an adverse critic of his work, said he was "in des premiers après ceux qui ont du génie."

For the *comédie larmoyante* see G. Lanson, *Nivole de la Chaussée et la comédie larmoyante* (1887).

**LACHES** (from Anglo-French *lachesse*, negligence, from *lasche*, modern *lâche*, unloosed, slack), a term for slackness or negligence, used particularly in law to signify negligence on the part of a person in doing that which he is by law bound to do, or unreasonable lapse of time in asserting a right, seeking relief, or claiming a privilege. Laches is frequently a bar to a remedy which might have been had, if prosecuted in proper time. Statutes of limitation specify the time within which various classes of actions may be brought. Apart from statutes of limitation courts of equity will often refuse relief to those
who have allowed unreasonable time to elapse in seeking it, on the principle vigilantibus ac non dormientibus jura subveniunt.

LACHINE, an incorporated town in Jacques Cartier county, Quebec, Canada, 8 m. W. of Montreal, on Lake St. Louis, an expansion of the St Lawrence river, and at the upper end of the Lachine canal. Pop. (1901) 5561. It is a station on the Grand Trunk railway and a port of call for steamers plying between Montreal and the Great Lakes. It is a favourite summer resort for the people of Montreal. It was named in 1669 in mockery of its then owner, Robert Cavelier de la Salle (1643-1687), who dreamed of a westward passage to China. In 1689 it was the scene of a terrible massacre of the French by the Iroquois.

LACHISH, a town of great importance in S. Palestine, often mentioned in the Tell el-Amarna tablets. It was destroyed by Joshua for joining the league against the Gibeonites (Joshua x 31-33) and assigned to the tribe of Judah (xv. 39). Rehoboam fortified it (2 Chron. x. 9). King Amaziah had his bed hither, was here murdered by conspirators (2 Kings xiv. 10). Sennacherib here conducted a campaign (2 Kings xviii. 13) during which Hezekiah endeavoured to make terms with him: the campaign is commemorated by bas-reliefs found in Nineveh, now in the British Museum (see G. Smith’s History of Sennacherib, p. 69). It was one of the last cities that resisted Nebuchadnezzar (Jer. xxxiv. 7). The meaning of Micah’s denunciation (i. 13) of the city is uncertain. The Onomasticon places it 7 m. from Eleutheropolis on the S. road, which agrees with the generally received identification, Tell el-Hesi, an important mound excavated for the Palestine Exploration Fund by Petrie and Bliss, 1890-1893. The name is preserved in a small Roman site in the neighbourhood, Umm Lakis, which probably represents a later dwelling-place of the descendants of the ancient inhabitants of the city.

See W. M. Flinders Petrie, Tell el-Hesi, and F. J. Bliss, A Mound of many Cities, both published by the Palestine Exploration Fund. (R. A. S. M.)

LACHMANN, KARL KONRAD FRIEDRICH WILHELM (1793-1851), German philologist and critic, was born at Brunswick on the 4th of March 1793. He studied at Leipzig and Göttingen, devoting himself mainly to philological studies. In 1815 he joined the Prussian army as a volunteer chasseur and accompanied his detachment to Paris, but did not encounter the enemy. In 1816 he became an assistant master in the Friedrich-Werder Gymnasium at Berlin, and a privat-docent at the university. The same summer he became one of the principal masters in the Friedrichs-Gymnasium of Königsberg, where he assisted his colleague, the Germanist Friedrich Karl Köcke (1785-1865), with his edition of Rudolf von Ems’ Berildam und Josephat (1818), and also assisted his friend in a contemplated edition of the works of Walther von der Vogelweide. In January 1818 he became professor extraordinarius of classical philology in the university of Königsberg, and at the same time began to lecture on Old German grammar and the Middle High German poets. He devoted himself during the following seven years to an extraordinarily minute study of those subjects, and in 1824 obtained leave of absence in order that he might search the libraries of middle and south Germany for further materials. In 1825 Lachmann was nominated extraordinary professor of classical and German philology in the university of Berlin (ordinary professor 1827); and in 1830 he was admitted a member of the Academy of Sciences. The remainder of his laborious and fruitful life as an author and a teacher was uneventful. He died on the 13th of March 1851.

Lachmann, who was the translator of the first volume of F. E. Muller’s edition of the scholasticum Alterius (1816), is a figure of considerable importance in the history of German philology (see Rudolf von Raumer, Geschichte der germanischen Philologie, 1870). In his Habilitationsschrift “Über die ur sprungliche Gestalt der Geschichten der Nebulange Nat (1816), and still more in his review of Hagen’s Nibelungen and Benecke’s Bonerius, contributed in 1817 to the Jenaische Literatureitung he had already laid down the rules of textual criticism and elucidated the phonetic and metrical principles of Middle High German in a manner which marked a distinct advance in that branch of investigation. The rigidly scientific character of his method becomes increasingly apparent in the Auswahl aus den hochdeutschen Dichtern des dreizehnten Jahrhunderts (1820), in the edition of Hartmann’s Ewern (1827), in that of Walther von der Vogelweide (1829), and in his edition of the Iliad consisting of the Berlin Academy edition, with the supplement of the Erlangen edition, and the Klaue (1826, 11th ed., 1892), which was followed by a critical commentary in 1836. Lachmann’s Betrachtungen über Homer’s Illus, first published in the Abhandlungen of the Berlin Academy in 1837, in which he shows that the Iliad consists of sixteen independent “lays” variously enlarged and interpolated, have had considerable influence on modern Homeric criticism (see Homer), although his views are no longer accepted. His smaller work on the Iliad was published in 1831, 3rd ed. 1846; and is longer, in two volumes, 1842-1850. The plan of Lachmann’s edition, explained by himself in the Stud. u. Krit. of 1830, is a modification of the unsuccessful project of Bentley. It seeks to restore the most ancient reading as current in the Eastern MSS., using the four main manuscripts in the order of their comparative value, and the single text which is believed to be the most primitive. The work was brought fairly completely in the 16th century, but was not to have been destroyed to build the episcopal palace at Croton. It is a Doric column with capital, about 27 ft. in height. Remains of marble roof-tiles have been seen on the spot (Livy xlii. 3) and architectural fragments were excavated in 1886-1887 by the Archaeological Institute of America. The sculptures found were mostly buried again, but a few fragments, some decorative terra-cottas and a dedicatory inscription to Hera of the 6th century B.C., in private possession at Croton, are described by F. von Duhn in Notizie degli scavi, 1897, 343 seq. The date of the erection of the temple may be given as 430-440 B.C.; it is not recorded by any ancient writer.

See R. Koldewey and O. Puchstein, Die griechischen Tempel in Unteritalien und Sicilien (Berlin 1899, 41).

LA CIOTAT, a coast town of south-eastern France in the départements of Bouches-du-Rhône, on the west shore of the Bay of La Ciotat, 26 m. S.E. of Marseilles by rail. Pop. (1906) 10,232. The port is easily accessible and well sheltered. The large shipbuilding yards and repairing docks of the Messageries Maritimes Company give employment to between 2000 and 3000 workmen. Fishing and an active coasting trade are carried on; the town is frequented for sea-bathing. La Ciotat was in ancient times the port of the neighbouring town of Citharistas (now the village of Ceyreste).

LA CLOCHE, JAMES DE ["Prince James Stuart"] (1644-1669), a character who was brought into the history of England by Lord Acton in 1862 (Home and Foreign Review, i. 146-174: "The Secret History of Charles II."). From information discovered by Father Boero in the archives of the Jesuits in Rome, Lord Acton averred that Charles II., when a lad at Lajedo, had a natural son, James. The evidence follows. On the 2nd of April 1668, as the register of the Jesuit House of Novices at Rome goes, "Il venne circonciso il beve de la cloche." His baggage was exiguous, his attire was clerical. He is described as "from the island of Jersey, under the king of England, aged 24." He possessed two documents in French, purporting to have been written by Charles II. at Whitehall, on the 25th of
September 1665, and on the 7th of February 1667. In both cases James acknowledges James to be his natural son, he styles him "James de la Cloche de Bourg du Jersey," and avers that he recognizes him publicly "would imperil the peace of the kingdoms"—why is not apparent. A third certificate of birth, in Latin, undated, is from Christina of Sweden, who declares that James, previously a Protestant, has been received into the church of Rome at Hamburg (where in 1667-1668 she was residing) on the 29th of July 1667. The next paper purports to be a letter from Charles II. of August 3/13 to Oliva, general of the Jesuits. The king writes, in French, that he has long wished to be secretly received into the church. He therefore desires that James, his son by a young lady "of the highest quality," and born to him when he was about sixteen, should be ordained a priest, come to England and receive him. Charles alludes to previous attempts of his own to be secretly admitted (1662). James must be sent secretly to London at once, and Oliva must say nothing to Christina (possibly he was enlisting a journey to Rome), and must never write to Charles except when James carries the letter. Charles next writes on August 29/September 9. He is most anxious that Christina should not meet James; if she knows Charles's design of changing his creed she will not keep it secret, and Charles will infallibly lose his life. With this letter there is another, written when the first had been sealed. Charles insists that James must not be accompanied, as novices were, when travelling, by a Jesuit socius or guardian. Charles's wife and mother have just heard that this is the rule, but the rule must be broken. James, who is to travel as "Henri de Rohan," must not come by way of France. Oliva will supply him with funds. On the back of this letter Oliva has written the draft of his brief reply to Charles (from Leghorn, October 14, 1668). He merely says that the bearer, a French gentleman (James spoke only French), will inform the king that his orders have been executed. Besides these two letters is one from Charles to James, of date August 4/14. It is addressed to "Le Prince Stuart," though none of Charles's bastards was allowed to bear the Stuart name. James is told that he may desert the clerical profession if he pleases. In that case "you may claim higher titles from us than the duke of Monmouth." (There was no higher title save prince of Wales!) If Charles and his brother, the duke of York, die childless, "the kingdoms belong to you, and parliament cannot legally oppose you, unless as, at present, they can only elect Protestant kings." This letter ought to have opened the eyes of Lord Acton and other historians who accept the myth of James de la Cloche. Charles knew that the crown of England was not elective, that there was no Exclusion Act, and that there were legal heirs if he and his brother died without issue. The last letter of Charles is dated November 18/28, and purports to have been brought from England to Oliva by James de la Cloche on his return to Rome. It reveals the fact that Oliva, despite Charles's orders, did send James by way of France, with a socius or guardian whom he was to pick up in France on his return to England. Charles says that James is to communicate certain matters to Oliva, and come back at once. Oliva is to give James all the money he needs, and Charles will later make an ample donation to the Jesuits. He acknowledges a debt to Oliva of £800, to be paid in six months. The reader will remark that the king has never paid a penny to James or to Oliva, and that Oliva has never communicated directly with Charles. The truth is that all of Charles's letters are forgeries. This is certain because in all he writes frequently as if his mother, Henrietta Maria, were in London, and constantly in company with him. Now she had left England for France in 1665, and to England she never returned. As the letters, including that to "Prince Stuart," are all forgeries, it is clear that de la Cloche was an impostor. His aim had been to get money from Oliva, and to pretend to travel to England, meaning to enjoy himself. He did not quite succeed, for Oliva sent a socius with him into France. His precautions to avoid a meeting with Christina of Sweden were necessary. She knew no more of him than did Charles, and would have exposed him.

The name of James de la Cloche appears not more in documents. He reached Rome in December 1668, and in January a person calling himself "Prince James Stuart" appears in Naples, accompanied by a socius styling himself a French knight of Malta. Both are on their way to England, but Prince James falls ill and stays in Naples, while his companion departs. The knight of Malta may be a Jesuit. In Naples, Prince James marries a girl of no position, and is arrested on suspicion of being a coiner. To his confessors (he had two in succession) he says that he is a son of Charles II. Our sources are the despatches of Kent, the English agent at Naples, and the Lettres, vol. iii., of Vincenzo Armanni (1674), who had his information from one of the confessors of the "Prince." The viceroy of Naples communicated with Charles II., who disowned the impostor; Prince James, however, was released, and died at Naples in August 1669, leaving a wild will, in which he claims for his sons, still unborn, the "apanage" of Monmouth or Wales, which is usual to bestow on natural sons of the king. The son lived till about 1730, a penniless pretend, and writer of begging letters.

It is needless to pursue Lord Acton's conjectures about later mysterious appearances of James de la Cloche at the court of Charles, or to discuss the legend that his mother was a lady of Jersey—or a sister of Charles! The Jersey myths may be found in The Man of the Mask (1908), by Monsignor Barnes, who argued that James was the man in the iron mask (see Iron Mask). Later Monsignor Barnes, who had observed that the letter of Charles to Prince James Stuart is a forgery, noticed the impossibility that Charles, in 1668, should constantly write of his mother as resident in London, which she left for ever in 1665.

Who de la Cloche really was it is impossible to discover, but he was a bold and successful swindler, who took in, not only the general of the Jesuits, but Lord Acton and a generation of guiltless historians. James de la Cloche had his opportunities, and made careful measurements of ancient buildings with a view to a precise determination of the length of the Roman foot. The journal of his voyage to South America was published in Paris in 1751. He also wrote in favour of inoculation, and on various other subjects, mainly connected with his work in South America. He died at Paris on the 4th of February 1774.

La Condamine, Charles Marie de (1701-1774), French geographer and mathematician, was born at Paris on the 28th of January 1701. He was trained for the military profession, but turned his attention to science and geographical exploration. After taking part in a scientific expedition in the Levant (1731), he became a member with Louis Godin and Pierre Bouguer of the expedition sent to Peru in 1735 to determine the length of a degree of the meridian in the neighbourhood of the equator. His associations with his principals were unhappy; the expedition was beset by many difficulties, and finally La Condamine separated from the rest and made his way from Quito down the Amazon, ultimately reaching Cayenne. His was the first scientific exploration of the Amazon. He returned to Paris in 1744 and published the results of his measurements and travels with a map of the Amazon in Mém. de l'académie des sciences, 1745 (English translation 1745-1747). On a visit to Rome La Condamine made careful measurements of the eternal flames, and the ancient buildings with a view to a precise determination of the length of the Roman foot. The journal of his voyage to South America was published in Paris in 1751. He also wrote in favour of inoculation, and on various other subjects, mainly connected with his work in South America. He died at Paris on the 4th of February 1774.
PARSON, consisting for the most part of barren limestone uplands scantily watered. The Eurotas valley, however, is fertile, and produces at the present day maize, olives, oranges and melons in great abundance. Laconia has no rivers of importance except the Eurotas and its largest tributary the Oenus (mod. Kefalina). The coast, especially on the east, is ragged and dangerous. Laconia has few good harbours, nor are there any islands lying off its shores with the exception of Cythera (Cerigo), S. of Cape Malea. The most important towns, besides Sparta and Gythium, were Bryseae, Amyclae and Pharis in the Eurotas plain, Pellana and Belbina on the upper Eurotas, Sellasia on the Oenus, Caryae on the Arcadian frontier, Prasiae, Zarax and Epidauros Limera on the east coast, Gerontea on the slopes of Pontar, Boeo, Asopus, Helos, Las and Teuthrone on the Laconian Gulf, and Hippola, Messa and Oetylos on the Messenian Gulf.

The earliest inhabitants of Laconia, according to tradition, were the autochthonous Leleges (q.v.). Mycenaean immigrants then settled at various places on the coast and even appear to have penetrated into the interior and to have founded Amycla. Phoenician traders, too, visited the shores of the Laconian Gulf, and there are a number of traditions conveying the impression that the Greeks inhabited the coast, e.g., a number of blocks of green Laconian porphyry from the quarries at Croceae have been found excavated for the palace of Minos at Knossos. In the Homeric poems Laconia appears as the realm of an Achaean prince, Menelaus, whose capital was perhaps Therapne on the left bank of the Eurotas, S.E. of Sparta; the Achaean conquerors, however, probably contended themselves with a suzerainty over Laconia and part of Messenia (q.v.) and were too few to occupy the whole land. The Achaean kingdom fell before the incoming Dorians, and throughout the classical period the history of Laconia is that of its capital Sparta (q.v.). In 650 B.C. the Laconian coast towns were freed from Spartan rule by the Roman general T. Quintius Flamininus, and became members of the Achaean League. When this was dissolved in 146 B.C., they remained independent under the title of the "Confederation of the Lacedaemonians" or "of the Free-Laconians" (κοινόν τῶν ἑλέαδαμονιῶν ἡ λεγέσις), the supreme officer of which was a στρατηγὸς (general) assisted by a τραχύς (treasurer). Augustus seems to have reorganized the league in some way, for Pausanias (iii. 21, 6) speaks of him as its founder. Of the twenty-four cities which originally composed the league, only eighteen remained members by the reign of Hadrian (see ACHAEO LEAGUE). In A.D. 395 a Gothic horde under Alaric devastated Laconia, and subsequently it was overrun by large bands of Slavic immigrants. Throughout the middle ages it was the scene of vigorous struggles between Slavs, Byzantines, Franks, Turks and Venetians, the chief memories of which are the ruined strongholds of Mistra near Sparta, Geraki (anc. Geronthrae) and Monemvasia, "the Gibraltar of Greece," on the east coast, and Passava near Gythium. A prominent part in the War of Independence was played by the Maniates or Mainotes, the inhabitants of the rugged peninsula formed by the southern part of Taygetus. They had all along maintained a virtual independence of the Turks and until quite recently retained their medieval customs, living in fortified towers and practising the vendetta or blood-feud.

The district has been divided into two departments (nomes), Laconia and Lacedaemon, with their capitals at Sparta and Gythium respectively. Pop. (1907) 61,552.

Archaeology. — Until 1904 archaeological research in Laconia was carried on only sporadically. Besides the excavations undertaken at Sparta, Gythium and Vaphio (q.v.), the most important were those at the Apollo sanctuary of Amyclae carried out by C. Tsountas in 1890 (Επιστ. άρχαιον. 1890, i, ii) and in 1904 by A. Furtwängler. At Kampos, on the western side of Taygetus, a small domed tomb of the "Mycenean" age was excavated in 1890 and yielded two lead statuettes of great interest, while at Arkig a similar tomb of poor construction was unearthed in the previous year. Important inscriptions were found at Gerontea (Geraki), notably five long fragments of the Edictum Diokletianian, and elsewhere. In 1904 the British Archaeological school at Athens undertook a systematic investigation of the ancient and medieval remains in Laconia. The results, of which the most important are summarized in the article SPARTA, are published in the British School Annual, x. ff. The acropolis of Geronthrae, a her-shrine at Angelina in the south-eastern highlands, and the sanctuary of Ino-Pasion in Thalamae have also been investigated.

Laconia, a city and the county-seat of Belknap county, New Hampshire, U.S.A., on both sides of the Winnipesaukee river, 28 m. N.N.E. of Concord. Pop. (1900) 8042 (1770 foreign-born); (1910) 10,183. Laconia is served by two divisions of the Boston & Maine railway, which has a very handsome granite passenger station (1802) and repair shops here. It is pleasantly situated in the lake district of central New Hampshire, and in the summer season Lake Winnissquam on the S. and W. and Lake Winnipesaukee on the N.E. attract many visitors. The city covers an area of 24.54 sq. m. (747 sq. m. annexed since 1860). Within the city limits, and about 6 m. from its centre, are the grounds of the Winnipesaukee Camp-Meeting Association, and the camping place for the annual reunions of the New Hampshire Veterans of the Civil War, both at The Weirs, the northermost point in the territory claimed by colonial Massachusetts; about 2 m. from the centre of Laconia is Lakeport (pop. 1900, 1352), which, like The Weirs, is a summer resort and a ward in the city of Laconia. Among the public institutions are the State School for Feeble-minded Children, a cottage hospital and the Laconia Public Library, lodged in the Gale Memorial Library building (1903). Another fine building is the Congregational Church (1906). The New Hampshire State Fish Hatchery is in Laconia. Water-power is furnished by the river. In 1905 Laconia ranked first among the cities of the state in the manufacture of hosiery and knit goods, and the value of these products for the year was 48.4% of the total value of the city's factory product; among its other manufactures are yarn, knitting machines, needles, sashes and blinds, axes, paper boxes, boats, gas and gasoline engines and freight, passenger and electric cars. The total value of the factory products increased from $2,152,379 in 1900 to $3,066,878 in 1905, or 43.9%. The portion of the city N. of the river, formerly known as Meredith Bridge, was set apart from the townships of Meredith and incorporated as a township under the name of Laconia in 1855; a section S. of the river was taken from the township of Concord in 1874; and Lakeport was added in 1893, when Laconia was chartered as a city. The name Laconia was first applied in New England to the region granted in 1629 to Mason and Gorges (see MAISON, JOHN).

Laconicum (i.e. Spartan, scavulcum, bath), the dry sweating room of the Roman thermae, contiguous to the caldarium or hot bath. The name is given to it as being the only form of warm bath that the Spartans admitted. The laconium was usually a circular room with niches in the axes of the diagonals and was covered by a conical roof with a circular opening at the top.
according to Vitruvius (v. 10), "from which a brazen shield is suspended by chains, capable of being so lowered and raised as to regulate the temperature." The walls of the lacockium were plastered with marble stucco and polished, and the conical roof covered with plastered and painted blue with gold stars. Sometimes, as in the old baths at Pompeii, the lacockium was provided in an apse at one end of the caldarium, but as a rule it was a separate room raised to a higher temperature and had no bath in it. In addition to the hypocaust under the floor the wall was lined with flue tiles. The largest lacockium, about 75 ft. in diameter, was that built by Agrippa in his thermae on the south side of the Pantheon, and is referred to by Cassius (lili. 23), who states that, in addition to other works, "he constructed the hot bath chamber which he called the Lacockicum Gymnasium." All traces of this building are lost; but in the additions made to the thermae of Agrippa by Septimius Severus another lacockium was built farther south, portions of which still exist in the so-called Arco di Giambelina.

LACORDAIRE, JEAN BAPTISTE HENRI (1802–1861), French ecclesiastic and orator, was born at Recy-sur-Suize, Côte d’Or, July 15, 1802. He was the eldest of the three sons of Jean Baptiste Henri Lacordaire (1801–1870), travelled a great deal in his youth, and was afterwards professor of comparative anatomy at Liége. For several years Lacordaire studied at Dion, showing a marked talent for rhetoric; this led him to the pursuit of law, and in the local debates of the advocates he attained a high celebrity. At Paris he thought of going on the stage, but was induced to finish his legal training and began to practise as an advocate (1817–1824). Meanwhile Lamennais had published his Essai sur l’Indifférence,—a passionate plea for Christianity and in particular for Roman Catholicism as necessary for the social progress of mankind. Lacordaire read, and his ardent and believing nature, weary of the theological negations of the Encyclopaedists, was convinced. In 1823 he became a theological student at the seminary of Saint Sulpice; four years later he was ordained and became almoner of the college Henri IV. He was called from it to co-operate with Lamennais in the editorship of L’Avenir, a journal established to advocate the union of the democratic principle with ultramontanism. Lacordaire strove to show that Catholicism was the best way of life in the modern world; he closely allied it with a well-defined liberty, equality and fraternity. But the new propagandism was denounced from Rome in an encyclical. In the meantime Lacordaire and Montalembert, believing that, under the charter of 1830, they were entitled to liberty of instruction, opened an independent free school. It was closed in two days, and the teachers fined before the court of peers. These reverses Lacordaire accepted with quiet dignity; but they brought his relationship with Lamennais to a close. He now began the course of Christian conferences at the Collège Stanislas, which attracted the art and intellect of Paris; thence he went to Notre Dame, and for two years his sermons were the delight of the capital. His presence was dignified, his voice capable of indefinite modulation, and his gestures animated and attractive. He still preached the gospel of the people’s sovereignty in civil life and the pope’s supremacy in religion, but brought to his propagandism the full resources of a mind familiar with philosophy, history and literature, and indeed led the reaction against Voltairean scepticism. He was asked to edit the Encyclopédie and to take a chair in the university. He declined both appointments, and in 1838 set out for Rome, reviving a great scheme for christianizing France by restoring the old order of St Dominic. At Rome he donned the habit of the preaching friar and joined the monastery of Minerva. His Mémoire pour le rétablissement en France de l’ordre des frères prêcheurs was then prepared and dedicated to his country; at the same time he collected the materials for the life of St Dominic. When he returned to France in 1841 he resumed his preaching at Notre Dame, but he had small success in re-establishing the order of which he had earlier been called himself monk. His funeral orations are the most notable in their kind of any delivered during his time, those devoted to Marshal Drouet and Daniel O’Connell being especially marked by point and clearness. He next thought that his presence in the National Assembly would be of use to his cause, but being debarred by his ecclesiastical superiors for declaring himself a republican, he resigned his seat ten days after his election. In 1850 he went back to Rome and was made provincial of the order, and for four years remained to make the Dominicans a religious power. In 1854 he retired to Serrôre to become director of a private lyceum, and remained there until he died on the 22nd of November 1861. He was elected to the Academy in the preceding year.

The best edition of Lacordaire’s works is the Œuvres complètes (6 vols., Paris, 1872–1873), published by C. Poussielgue, which contains, besides the Conférences, the exquisitely written, but uncritical, Vie et pensées de Dominique de Guzman ou le vie chrétienne. For a complete list of his published correspondence see L. Petit de Julleville’s Histoire de la langue et de la littérature française, vii. 598.

The authoritative biography is by Ch. Foiset (2 vols., Paris, 1870). The religious aspect of his character is best shown in Père B. Ch. Carmen’s Vie du Père Lacordaire (2 vols., Paris, 1850–1860—translated by A. Th. Drane, London, 1868); see also Count C. F. R. de Montalembert’s Un Moine au XIXe siècle (Paris, 1862—translated by F. Aylward, London, 1867). There are lives by Mrs H. L. Lear (London, 1882); by A. Ricard (1 vol. of L’École mahoméenne, Paris, 1883); by Comte O. d’Haussonville (1 vol. des Grands derniers Français series, Paris, 1897); by Gabriel Ledos (Paris, 1897); by J. B. Ledos (Paris, 1898). The Correspondance intime du Père Lacordaire, edited by H. Villard (Paris, 1870), may also be consulted. See also Saint-Beuve’s Essais de Littérature. Several of Lacordaire’s Conférences have been collected in articles (1866–1879), entitled Conférences, in God (1870); God and Man (1872); Life (1875). For a theological study of the Conférences de Notre Dame, see an article by Bishop J. C. Hedley in Dublin Review (October 1870).

LACQUER, or LACKER, a general term for coloured and frequently opaque varnishes applied to certain metallic objects and to wood. The term is derived from the resin lac, which substance is the basis of lacquers properly so called. Technically, among Western nations, lacquering is restricted to the coating of polished metals or metallic surfaces, such as brass, pewter and tin, with prepared varnishes which will give them a golden, brownish-red or other lustre as desired. Throughout the East Indies the lacquering of wooden surfaces is universally practised, large articles of household furniture, as well as small boxes, trays, toys and paper-mâché objects, being decorated with brightly-coloured and variegated lacquer. The lacquer used in the East is, in general, variously coloured sealing-wax, applied, smoothed and polished in a heated condition; and by various devices intricate marbled, streaked and mottled designs are produced. Quite distinct from these, and from all other forms of lacquer, is the lacquer work of Japan, for which see JAPAN, § Art.

LACRETTELLE, PIERRE LOUIS DE (1751–1824), French politician and writer, was born at Metz on the 9th of October 1751. He practised as a barrister in Paris; and under the Revolution was elected as a député suppléant in the Constituent Assembly, and later as deputy in the Legislative Assembly. He belonged to the moderate party known as the "Peuillants," but after the 10th of August 1792 he ceased to take part in public life. In 1803 he became a member of the Institute, taking the place of La Harpe; under the Restoration he was one of the seven members of the Ministère des Beaux Arts; he wrote an History of France, Sur le 18 Brumaire (1790), some Fragments politiques et littéraires (1817), and a treatise Des partis politiques et des factions de la prétendue aristocratie d’aujourd’hui (1819).

His younger brother, JEAN CHARLES DOMINIQUE DE LACRETTELLE, called Lacretelle le jeune (1766–1855), historian and journalist, was also born at Metz on the 3rd of September 1766. He was called to Paris by his brother in 1787, and during the Revolution belonged, like him, to the party of the Peuillants. He was for some time secretary to the duc de la Rochefoucauld-Liancourt, the celebrated philanthropist, and afterwards joined the staff of the Journal de Paris; then managed by Suard, and where he had as colleagues André Chénier and Antoine Roucher. He made no attempt to hide his monarchist sympathies, and this, together with the way in which he reported the trial and death of Louis XVI., brought him in peril of his life; to avoid this...
danger he enlisted in the army, but after Thermidor he returned to Paris and to his newspaper work. He was involved in the royalist movement led by 13th Vendémiaire and condemned to deportation on the 18th Fructidor; but, thanks to powerful influence, he was left “forgotten” in prison till after the 18th Brumaire, when he was set at liberty by Fouche. Under the Empire he was appointed a professor of history in the Faculté des Lettres of Paris (1809), and elected as a member of the Académie française (1811). In 1827 he was prime mover in the protest made by the French Academy against the minister Peyronnet’s law on the press, which led to the failure of that measure, but this step cost him, as it did Vilméman, his post as conseur royal. Under Louis Philippe he devoted himself entirely to his teaching and literary work. In 1848 he retired to Mâcon; but there, as in Paris, he was the centre of a brilliant circle, for he was a wonderful causeur, and an equally good listener, and had many interesting experiences to recall. He died on the 26th of March 1855.

His son Pierre Henri (1815-1890) was a humorous writer and politician of purely contemporary interest.

J. C. Lacretelle’s chief work is a series of histories of the 18th century, the Revolution and its sequel: Précis historique de la Révolution française, appended to the history of Rabaud St Etienne, and partly written in the prison of La Force (5 vols., 1801-1806); Histoire de France pendant le XVIIIe siècle (6 vols., 1808); Histoire de l’Assemblée Constituante (2 vols., 1821); L’Assemblée Constituante (1822); Histoire de 1814 (6 vols., 1824-1825); Histoire de France depuis la Restauration (1829-1835); Histoire du consulat et de l’Empire (4 vols., 1846). The author was a moderate and fair-minded man, but possessed neither great powers of style, nor striking historical insight, nor the special historian’s power of writing minute accuracy of detail with breadth of view. Carlyle’s sarcastic remark on Lacretelle’s history of the Revolution, that it “exists, but does not profit much,” is partly true of all his books. He had been an eyewitness of and an actor in the events which he describes, but his testimony must be accepted with caution.

LACROIX, ANTOINE FRANÇOIS ALFRED (1832-1917), French mineralogist and geologist, was born at Mâcon, Saône et Loire, on the 4th of February 1832. He took the degree of D. ès Sc. in Paris, 1859. In 1853 he was appointed professor of mineralogy at the Jardins des Plantes, Paris, and in 1860 director of the mineralogical laboratory in the École des Hautes Études. He paid especial attention to minerals connected with volcanic phenomena and igneous rocks, to the effects of metamorphism, and to mineral veins, in various parts of the world, notably in the Pyrenees. In his numerous contributions to scientific journals he dealt with the mineralogy and petrology of Madagascar, and published an elaborate and exhaustive volume on the eruptions in Martinique, La Montagne Pelée et ses éruptions (1904). He also issued an important work entitled Mineralogie de la France et de ses Colonies (1863-1868), and other works in conjunction with A. Michel Lévy. He was elected member of the Académie des Sciences in 1904.

LAGROIX, PAUL (1806-1884). French author and journalist, was born in Paris on the 27th of April 1806, the son of a novelist. He is best known under his pseudonym of P. L. Jacob, bibliophile, or “Bibliophile Jacob,” suggested by the constant interest he took in public libraries and books generally. Lagroix was an extremely prolific and varied writer. Over twenty historical romances alone came from his pen, and he also wrote a variety of serious historical works, including a history of Napoleon III, and the life and times of the Tsar Nicholas I. of Russia. He was the joint author with Ferdinand Séré of a five-volume work, Le Moyen Age et La Renaissance (1847), a standard work on the manners, customs and dress of those times, the chief merit of which lies in the great number of illustrations it contains. He also wrote many monographs on phases of the history of culture. Over the signature Pierre Dufour was published an exhaustive Histoire de la Prostitution (1851-1852), which has always been attributed to Lagroix. His works on bibliography were also extremely numerous. In 1885 he was appointed librarian of the Arnaud Library, Paris. He died in Paris on the 16th of October 1884.

LAGROM (Serbo-Croatian Lokrum), a small island in the Adriatic Sea, forming part of the Austrian kingdom of Dalmatia, and lying less than a half mile of Ragusa. Though barely 14 m. in length, Lagroma is remarkable for the beauty of its sub-tropical vegetation. It was a favourite resort of the archduke Maximilian, afterwards emperor of Mexico (1832-1867), who restored the château and park; and of the Austrian crown prince Rudolph (1857-1889). It contains an 11th-century Benedictine monastery; and the remains of a church, said by a very doubtful local tradition to have been founded by Richard I. of England (1157-1199), form part of the imperial château.

See Lacroix, an illustrated descriptive work by the crown princess Stéphanie (afterwards Countess Longy) (Vienna, 1892).

LA CROCE, a city and the county-seat of La Crosse county, Wisconsin, U.S.A., about 180 m. W.N.W. of Milwaukee, and about 120 m. S.E. of St Paul, Minnesota, on the E. bank of the Mississippi river, at the mouth of the Black and of the La Crose rivers. Pop. (1900) 25,805; (1910 census) 30,477. Of the total population in 1900, 7,722 were foreign-born, 3,130 being German and 2,025 Norwegian, and 17,555 were of foreign parentage (both parents foreign-born), including 7,853 of German parentage, 4,422 of Norwegian parentage, and 1062 of Bohemian parentage. La Crosse is served by the Chicago & North Western, the Chicago, Milwaukee & St Paul, the Chicago, Burlington & Quincy, the La Crosse & South Eastern, and the Green Bay & Western railways, and by river steamboat lines on the Mississippi. The river is crossed here by a railway bridge (C.M. & St P.) and a wagon bridge. The city is situated on a prairie, extending back from the river about 2½ m. to bluffs, from which fine views may be obtained. Among the city’s buildings and institutions are the Federal Building (1886-1887), the County Court House (1902-1903), the Public Library (with more than 20,000 volumes), the City Hall (1891), the High School Building (1905-1906), the St Francis, La Crosse and Lutheran hospitals, a Young Men’s Christian Association Building, a Young Women’s Christian Association Building, a U.S. Weather Station (1907), and a U.S. Fish Station (1905). La Crosse is the seat of a state Normal School. Among the city’s parks are Petitbon (an island in the Mississippi), Riverside, Burns, Fair Ground and Myrick. The city is the see of a Roman Catholic bishop. La Crosse is an important lumber and grain market, and is the principal wholesale distributing centre for a large territory in S.W. Wisconsin, Minnesota, and the northern part of the State. The city has grain elevators, flour mills (the value of flour and grist mill products in 1905 was $2,166,116), and breweries (product value in 1905, $1,440,639). Other important manufactures are agricultural implements ($542,425 in 1905), lumber and planing mill products, leather, woolen, knit and rubber goods, tobacco, cigars and cigarettes, carriages, foundry and machine-shop products, a cigar factory and its products, cooperage, pearl buttons, brooms and brushes. The total value of the factory product in 1905 was $8,139,432, as against $7,576,581 in 1900. The city owns and operates its water-work systems, the wagon bridge (1889-1891) across the Mississippi, and a toll road (2½ m. long) to the village of La Crescent, Minn.

Father Hennepin and du Lhut visited or passed the site of La Crosse as early as 1680, but it is possible that adventurous coureurs-des-bois preceded them. The first permanent settlement was made in 1841, and La Crosse was made the county-seat in 1855 and was chartered as a city in 1886.

LACROSSE, the national ball game of Canada. It derives its name from the resemblance of its chief implement used, the curved netted stick, to a bishop’s crozier. It was borrowed from the Indian tribes of North America. In the old days, according to Catlin, the warriors of two tribes in their war-paint would form the sides, often 500 or 1000 strong. The goals were rectangular, and practically no side boundaries. A solemn dance preceded the game, after which the ball was tossed into the air and the two sides rushed to catch it on "crosses," similar to those now in use. The medicine-men acted as umpires, and the squaws urged on the men by beating
them with switches. The game attracted much attention from the early French settlers in Canada. In 1763, after Canada had become British, the same game used by the Algonquins to carry out an ingenious piece of treachery. On the 4th of June, when the garrison of Fort Michilimackinac (now Mackinac) was celebrating the king’s birthday, it was invited by the Ottawas, under their chief Pontiac, to witness a game of “baggateway” (lacrosse). The players gradually worked their way close to the goal, when, throwing aside their crosses and seizing their tomahawks which the squaws suddenly produced from under their blankets, they rushed into the fort and massacred all the inmates except a few Frenchmen.

The game found favour among the British settlers, but it was not until 1867, the year in which Canada became a Dominion, that G. W. Beers, a prominent player, suggested that Lacrosse should be recognized as the national game, and the National Lacrosse Association of Canada was formed. From that time the game has flourished vigorously in Canada and to a less extent in the United States. In 1868 an English Lacrosse Association was formed, but, although a team of Indians visited the United Kingdom in 1867, it was not until sometime later that the game became at all popular in Great Britain. Its progress was marked by the founding of teams representing the Toronto Lacrosse Club in 1888 and 1902, the method of the Canadians and their wonderful “short-passing” exciting much admiration. In 1907 the Capitals of Ottawa visited England, playing six matches, all of which were won by the Canadians. The match North v. South has been played annually in England since 1882. A county championship was inaugurated in 1905. A North of England League, embracing ten clubs, began playing league matches in 1897; and a match between the universities of Oxford and Cambridge has been played annually since 1903. A match between England and Ireland was played annually from 1891 to 1904.

**Implements of the Game.**—The ball is made of indiarubber sponge, weighs between 4f and 4f oz., and measures 8 to 8½ in. in circumference. The crosse is formed of a light staff of hickory wood, the top being bent to form a kind of hook. The tip of which is sharpened, drawn and fastened to the shaft about 2 ft. from the other end. The oval triangle thus formed is covered with a network of gut or rawhide, loose enough to hold the ball but not to form a bag. At no

---

**LA CRUZ—LACTANTIUS FIRMIANUS**

LA CRUZ, RAMÓN DE (1731–1794), Spanish dramatist, was born at Madrid on the 28th of March 1731. He was a clerk in the ministry of finance, and is the author of three hundred _saínetes_, little farcical sketches of city life, written to be played between the acts of a longer play. He published a selection in ten volumes (Madrid, 1786–1791), and died on the 5th of March 1794. The best of his pieces, such as _Las Tertulias de Madrid_, are delightful specimens of satiric observation.

See E. Cotardo y Mori, _Don Ramón de la Cruz y sus obras_ (Madrid, 1899); C. Cambronería, _Saínetes inéditos existentes en la Biblioteca Municipal de Madrid_ (Madrid, 1900).

**LACRYMATORY (from Lat. _lacrima_, a tear), a class of small vessels of terra-cotta, or, more frequently, of glass, found in Roman and late Greek tombs, and supposed to have been bottles into which mourners dropped their tears. They contained unguents, and to the use of unguents at funeral ceremonies the finding of so many of these vessels in tombs is due. They are shaped like a spindle, or a flask with a long small neck and a body in the form of a bulb.**

**LACTANTIUS FIRMIANUS** (c. 360–c. 340), also called Lucius Caelius (or Caecilius) Lactantius Firmianus, was a Greek writer who from the beauty of his style has been called the "Christian Cicero." His history is very obscure. He was born of heathen parents in Africa about 260, and became a pupil of Aurbiosius, whom he far excelled in style though his knowledge of the Scriptures was equally slight. About 290 he went to Nicomedia in Bithynia while Diocletian was emperor, to teach rhetoric, but found little work to do in that Greek-speaking city. In middle age he became a convert to Christianity, and about 306 he went to Gaul (Trèves) on the invitation of Constantine the Great, and became tutor to his eldest son, Crispus. He probably died about 340.

Lactantius' chief work, _Dictinum Institutionum Libri Septem_, is an "apology" for and an introduction to Christianity, written in exquisite Latin, but displaying such ignorance as to have incurred the charge of favoring the Arian and Manichæan heresies. It seems to have been begun in Nicomedia about 304 and finished in Gaul before 312. Two long eulogistic addresses and most of the brief apostrophes to the emperor are from a later hand, which has added some dualistic touches. The twenty books of the work have separate titles given to them either by the author or by a later editor. The first, _De Falsa Religione_, and the second, _De Origine Erroris_, attack the polytheism of heathendom, show the unity of the God of creation and providence, and try to explain how men have been corrupted by demons. The third book, _De Falso Sapientia_, describes and criticizes the various systems of prevalent philosophy. The fourth book, _De Vera Sapientia et Religione_, insists upon the inseparable union of true wisdom and true religion, and maintains that this union is made real in the person of Christ. The fifth book, _De Justitia_, maintains that true righteousness is not to be found apart from Christianity, and that it springs from piety which consists in the knowledge of God. The sixth book, _De Vero Cultu_, describes the true worship of God, which is righteousness,
and consists chiefly in the exercise of Christian love towards God and man. The seventh book, *De Vita Beata*, discusses, among a variety of subjects, the chief good, immortality, the second advent and the resurrection. Jerome states that Lactantius wrote an epitome of these *Institutions*, and such a work, which may well be authentic, was discovered in MS. in the royal library at Turin in 1711 by C. M. Pfaff.

Besides the *Institutions* Lactantius wrote several treatises:
1. *De Ira Dei*, addressed to one Donatus and directed against the Epicurean philosophy.
2. *De Opificio Dei sine Formatione Hominis*, his earliest work, and one which reveals very little Christian influence. He exhorts a former pupil, Demetrinius, not to be led astray by wealth from virtue; and he demonstrates the providence of God from the adaptability and beauty of the human body.
3. A celebrated incendiary treatise, *De Moribus Persecutorum*, which describes God’s judgments on the persecutors of his church from Nero to Diocletian, and has served as a model for numberless writings. *De Mort. Persecut.* is not in the earlier editions of Lactantius; it was discovered and printed by Baluze in 1679.

Many critics ascribe to it an unknown Lucius Caecilius; there are certainly serious differences of grammar, style and temper between it and the writings already mentioned. It was probably composed in Nicomedea, c. 315. Jerome speaks of Lactantius as a poet, and several poems have been attributed to him:--*De Ave Phoenix* (which Harnack thinks makes use of 1 Clement), *De Passione Domini* and *De Resurrectione (Domini)* or *De Pascha ad Felicem Episcopum*. The first of these may belong to Lactantius’s heathen days; the second is a product of the Renaissance (c. 1500), the third was written by Venantius Fortunatus in the 6th century.

**LACTIC ACID** (hydroxypropionic acid). C$_7$H$_6$O$_4$. Two lactic acids are known, differing from each other in the position occupied by the hydroxyl group in the molecule; they are known respectively as α-hydroxypropionic acid (fermentation or inactivelactic acid), CH$_3$CH(OH)-CO$_2$H, and β-hydroxypropionic acid (hydroacrylic acid), (q.v.), CH$_2$OH-CO$_2$H. Although on structural grounds there should be only two hydroxypropionic acids, as a matter of fact four lactic acids are known. The third isomer (sarcolactic acid) is found in meat extract (J. v. Liebig), and may be prepared by the action of *Penicillium glaucum* on a solution of ordinary ammonium lactate. It is identical with α-hydroxypropionic acid in almost every respect, except with regard to its physical properties. The fourth isomer, formed by the action of *Bacillus laevo-lacti* on cane-sugar, resembles sarcolactic acid in every respect, except in its action on polarized light (see STEREOSISOMERISM).

**FERMENTATION**, or ethyldene lactic acid, was isolated by K. W. Scheele (*Trans. Stockholm Acad. 1780*) from sour milk (Lat. lactitii, milk, which was used as a preservative), and independently by A. F. de Fourrey and L. N. Vaugueuil, maintained that Scheele’s new acid was nothing but impropic acetic acid. This notion was combated by J. Berzelius, and finally refuted (1832) by J. V. L. Hering, who, by the elementary analyses of lactates, proved the existence of this acid as a distinct compound. It may be prepared by the lactic fermentation of starches, sugars, gums, &c., the sugar being dissolved in water and acidified with tarrary acid and then fermented by the addition of sour milk, with a little putrid cheese. Zinc carbonate is added to the mixture (to neutralize the acid formed), which is kept warm for some days and well stirred. On boiling it, the acid is neutralized out of the solution. The acid may also be synthesized by the decomposition of alanine (α-aminopropionic acid) by nitrous acid (K. Strecker, *Ann.*, 1850, 75, p. 27); by the oxidation of propylene glycol (A. Wurtz); by boiling an a-chloropropionic acid with caustic alkalis, or with silver oxide and water; by the reduction of pyruvic acid with sodium amalgam; or from acetaldehyde by the cyanhydrin reaction (J. Willicens, *Ann.*, 1863, 128, p. 13).

\[
\begin{align*}
\text{CH}_3\text{CHO} &\rightarrow \text{CH}_3\text{CH(OH)}\text{CN} \\
&\rightarrow \text{CH}_3\text{CH(OH)}\text{CO}_2\text{H}
\end{align*}
\]

It forms a colourless syrup, of specific gravity 1.2485 (15°C), and decomposes on distillation under ordinary atmospheric pressure; but at very low pressures (about 1 mm.), it distils at about 85° C., and then sets to a crystalline solid, which melts at about 18° C. It is soluble in water, and possesses the properties both of an acid and of an alcohol. When heated with dilute sulphuric acid to 130° C., under pressure, it is resolved into formic acid and acetaldehyde. Chromic acid oxidizes it to acetic acid and carbon dioxide; potassium permanganate oxidizes it to pyruvic acid, an acid to oxalic acid, and a mixture of manganese dioxide and sulphuric acid to acetaldehyde and carbon dioxide. Hydrobromic acid converts it to a-bromopropionic acid, and hydriodic acid into propionic acid.

**Lactate**, $O<\text{CH}_2\text{CH(OH)}\text{CH(OH)}\text{CO}_2\text{H}>\text{O}$, a crystalline solid, of melting-point 124° C., is one of the products obtained by the distillation of lactic acid.

**LACTONES**, the cyclic esters of hydroxy acids, resulting from the internal elimination of water between the hydroxy and carboxyl groups, this reaction taking place when the hydroxy acid is liberated from its salts by a mineral acid. The α and β-hydroxy acids do not form lactones, the tendency for lactone formation appearing first with the γ-hydroxy acids, thus γ-hydroxybutyric acid, CH$_3$OH-CH$_2$CO$_2$H, yields γ-butyrolactone, CH$_3$-CH$_2$-CH$_2$-CO-O. These compounds may also be prepared by the distillation of the γ-halogen fatty acids, or by the action of alkali carbonates on these acids, or from βγ-or βδ-unsaturated acids by digestion with hydrobromic acid or dilute sulphuric acid.

The lactones are mostly liquids which are readily soluble in alcohol, ether and water. On boiling with water, they are partially converted into the hydroxy acids. They are easily saponified by the caustic alkalis.

**γ-Butyrolactone** is a liquid which boils at 206° C. It is miscible with water in all proportions and is volatile in steam. γ-Sebacolactone, CH$_3$-CH$_2$-CH$_2$-CO-O, is a liquid which boils at 202°-208° C.

**LACTONES** are also known, and may be prepared by distilling the 5-chloro acids.

**LA CUEVA, JUAN DE** (1520?-1609?), Spanish dramatist and poet, was born at Seville, and towards 1579 began writing for the stage. His plays, fourteen in number, were published in 1588, and are the earliest manifestations of the dramatic methods developed by Lope de Vega. Abandoning the Senecan model hitherto universal in Spain, Cueva took for his themes matters of national legend, historic tradition, recent victories and the actualities of contemporary life: this amalgam of epic and realistic elements, and the introduction of a great variety of metres, prepared the way for the Spanish romantic drama of the 17th century. A peculiar interest attaches to *El Infamador*, a play in which the character of Lecinco anticipates the classic type of Don Juan. As an initiative force, Cueva is a figure of great historical importance; his epic poem, *La Conquista de Bética* (1603), shows his weakness as an artist. The last work to which his name is attached is the *Ejemplar político* (1609), and he is believed to have died shortly after its publication.

**LACUNAR**, the Latin name in architecture for a panelled or cofferred ceiling or soffit. The word is derived from *lacuna*, a cavity or hollow, a blank, hiatus or gap. The panels or coffers of a ceiling are by Vitruvius called *lacunaria*.

**LACUNA** (O. Fr. la cuazon, disturbance), the name given to the Franc-Comtois leader CLAUDE FROST (1667-1681), who was born at Longchaumois (department of Jura) on the 17th of June 1667. He gained his first military experience when the French invaded Burgundy in 1669, harrying the French
troops from the castles of Montaigu and St. Laurent-la-Roche, and devastating the frontier districts of Bresse and Bugey with fire and sword (1642-1643). In the first invasion of Franche-Comté by Louis XIV. in 1668, Lacuon was unable to make any effective resistance, but he played an important part in Louis's second invasion. In 1673 he defended Salins for some time; after the capitulation of the town he took refuge in Italy. He died at Milan on the 21st of December 1681.

**LACY, COUNT—LADAKH AND BALTISTAN**

Lacy, Count—Ladakh and Baltistan

Theresa's death, became the sovereign of the Austrian dominions as well as emperor. Lacy remained his most trusted friend. More serious than the War of the Bavarian Succession was the Turkish war which presently broke out. Lacy was now old and worn out, and his tenure of command therein was not marked by any greater measure of success than in the case of the other Austrian generals. His active career was at an end, although he continued his effective interest in the affairs of the state and the army throughout the reign of Joseph's successor, Leopold I. His last years were spent in retirement at his castle of Neuwaldegg near Vienna. He died at Vienna on the 24th of November 1801.

See memoir by A. v. Arnet in Allgemeine deutsche Biographie (Leipzig, 1883).

Lacy, Harriette Deborah (1807-1874), English actress, was born in London, the daughter of a tradesman named Taylor. Her first appearance on the stage was at Bath in 1827 as Julia in The Rivals, and she was immediately given leading parts in both comedy and tragedy. Her first London appearance was in 1830 as Nina, in Dimond's Carnival of Naples. Her Rosalind, Aspasia (to Macready's Melantius) in The Bridal, and Lady Teazle to the Charles Surface of Walter Lacy (1809-1809) — to whom she was married in 1839—confirmed her position and popularity. She was the original Helen in The Hunchback (1832), and also created Nell Gwynne in Jerrold's play of that name, and the heroine in his Housekeeper. She was considered the first Ophelia of her day. She retired in 1848.

Lacy, Michael Rophino (1705-1867), Irish musician, son of a merchant, was born at Bilbao and appeared there in public as a violinist in 1801. He was sent to study in Paris under Kreutzer, and soon began a successful career, being known as "Le Petit Espagnol." He played in London for some years after 1805, and then became an actor, but in 1818 resumed the musical profession, and in 1820 became leader of the ballet at the King's theatre, London. He composed or adapted for other composers a number of operas and an oratorio, The Israelites in Egypt. He died in London on the 20th of September 1867.

Lacydes of Cyrene, Greek philosopher, was head of the Academy at Athens in succession to Arcesilaus about 241 B.C. Though some regard him as the founder of the New Academy, the testimony of antiquity is that he adhered in general to the theory of Arcesilaus, and, therefore, that he belonged to the Middle Academy. He lectured in a garden called the Lacydeum, which was presented to him by Attalus I. of Pergamus, and for twenty-six years maintained the traditions of the Academy. He is said to have written treatises, but nothing survives. Before his death he voluntarily resigned his position to his pupils, Euander and Telecles. Apart from a number of anecdotes distinguished rather for sarcastic humour than for probability, Lacydes exists for us as a man of refined character, a hard worker and an accomplished orator. According to Athenaeus (x. 438) and Diogenes Laërtius (iv. 66) he died from excessive drinking, but the story is discredited by the eulogy of Eusebius (Praeap. Ev. xiv. 7), that he was in all things moderate.

See Ciceron, Acad. ii. 6; and Aelian, V.H. ii. 41; also articles ACADEMY, ARCESILAUS, CARNEADES.

Ladakh and Baltistan, a province of Kashmir, India. The name Ladak, commonly but less correctly spelt Ladak, and sometimes Ladag, belongs primarily to the broad valley of the upper Indus in West Tibet, but includes several surrounding districts in political connexion with it; the present limits are between 75° 40' and 86° 30' E., and between 32° 25' and 36° N. It is bounded N. by the Kuenlun range and the slopes of the Karakoram, N.W. and W. by the dependency of Baltistan or Little Tibet, S.W. by Kashmir proper, S. by British Himalayan territory, and E. by the Tibetan provinces of Ngari and Rudok.

The whole region lies very high, the valleys of Rupshu in the south-east being 15,000 ft., and the Indus near Lh 17,000 ft., while the average height of the surrounding ranges is 19,000 ft. The proportion of arable and even possible pasture land to barren rock and gravel is very small. Pop., including Baltistan (1901)
LADAKH AND BALTISTAN

165,992, of whom 30,216 in Ladakh proper are Buddhists, whereas the Baltis have adopted the Shiah form of Islam.

The natural features of the country may be best explained by reference to two native terms, under one or other of which every part is included; viz. Changtang, i.e. "northern, or high plain," where the amount of level ground is considerable, and rong, i.e. "deep valley," where the contrary condition prevails.

The former predominates in the east, diminishing gradually westwards. There, although the vast alluvial deposits which once filled the valley to a remarkably uniform height of about 15,000 ft. have left their traces on the mountainsides, they have undergone immense denudation, and their débris now forms secondary deposits, flat bottoms or shelving slopes, the only spots available for cultivation or pasture. These masses of alluvium are often either metamorphosed to a subcrystalline rock still showing the composition of the strata, or simply consolidated by lime.

Grand scenery is exceptional, for the valleys are confined, and from the higher points the view is generally of a confused mass of brown or yellow hills, absolutely barren, and of no great apparent height. The soil is sandy or subcrystalline. The main Himalayan ranges continues here, the direction being north-west and south-east. A central range divides the Indus valley, here 4 to 8 m. wide, from that of its north branch the Shyok, which with its fertile tributary valley of Nubra is again bounded on the north by the Karakoram. This central ridge is mostly syenitic gneiss, and north-east from it are found, successively, Silurian slates, Carboniferous shales and Triassic limestones, the gneiss recurring at the Turkestan frontier. The Indus lies along the line which separates the crystalline rocks from the Eocene sandstones and shales of the lower range of hills on the left bank, the lofty mountains behind them consisting of parallel bands of rocks from Silurian to Cretaceous.

Several lakes in the east districts at about 14,000 ft. have been of much greater extent, and connected with the river systems of the country, but they are now mostly without outlet, saline, and in process of desiccation.

Leh is the capital of Ladakh, and the road to Leh from Srinagar lies up the lovely Sind valley to the sources of the river at the Zoji La Pass (11,300 ft.) in the Zaskar range. This is the range which, skirting the southern edge of the upland plains of Deosai in Baltistan, divides them from the valley of Kashmir, and then continues to Nanga Parbat (26,650 ft.) and beyond that mountain stretches to the north of Swat and Bajour. To the south-east it is an unbroken chain till it merges into the line of snowy peaks seen from Simla and the plains of India—the range which reaches past Chini to the famous peaks of Gangotri, Nandadevi and Nampa. It is the most central and conspicuous range in the Himalaya.

The Zoji La, which curves from the head of the Sind valley on to the bleak uplands of Dras (where lies the road to the trough of the Indus and Leh), is, in spite of its altitude, a pass on which little snow lies; but for local accumulations, it would be open all the year round. It affords a typical instance of that cutting-back process by which a river-head may erode a channel through a watershed into the plateau behind, there being no steep fall towards the Indus on the northern side of the range. From the Zoji La the road continues by easy gradients, following the line of the Dras drainage, to the Indus, when it turns up the valley to Leh. From Leh there are many routes into Tibet, the best known being that from the Indus valley to the Tibetan plateau, by the Chang La, to Lake Pangong and Rudok (14,000 ft.). Rudok occupies a forward position on the western Tibetan border analogous to that of Leh in Kashmir. The chief trade route to Lhasa from Leh, however, follows the line offered by the valleys of the Indus and the Brahmaputra (or Tsanpo), crossing the divide between these rivers north of Lake Manasarowar.

The observatory at Leh is the most elevated observatory in Asia. The atmosphere of the Indus valley is remarkably clear and transparent, and the heat of the sun is very great. There is generally a difference of more than 60° between the reading of the exposed sun thermometer in vacuo and the air temperature in the shade, and this difference has occasionally exceeded 90°. The mean annual temperature at Leh is 40°, that of the coldest months (January and February) only 18° and 10°, but it rises rapidly from February to July, in which month it reaches 62° with a mean diurnal maximum of 80° both in that month and August, and an average difference of 29° or 30° between the early morning and afternoon. The mean highest temperature of the year is 90°, varying between 84° and 93° in the twelve years previous to 1893. On the other hand, in the winter the minimum thermometer falls occasionally below 0°, and in 1878 reached as low as 17° below zero. The extreme range of recorded temperature is therefore not less than 110°. The air is as dry as Quetta, and rather more uniformly so.... The amount of rain and snow is insignificant. The average rain (and snow) fall is only 2-7 in. in the year. The winds are generally light, and depend on the local direction of the valleys. At Leh, which stands at the entrance of the valley leading to the Kardang Pass, the most common directions are between south-east and north-west in the daytime and summer, and from north-east in the winter, especially in the later months of the year.

The present value of the trade between British India and Tibet passing through Ladakh is inconsiderable. Ladakh, however, is improving in its trade prospects apart from Tibet. It is curious that both Ladakh and Tibet import a considerable amount of treasure, tributes and other valuables from the former, although the Tibetans do not render these services for anything resembling cash payment. Ladakh is to some extent a barrier to the waste of the Tibetan territory, and the central position naturally entitles it to be a great trade mart.

The adjoining territory of Baltistan forms the west extremity of Tibet, whose natural limits here are the abrupt southward bend in 74° 45' E., and the mountains to the north and west, separating a comparatively peaceful Tibetan population from the fierce Aryan tribes beyond. Mahomedan writers about the 16th century speak of Baltistan as "Little Tibet," and of Ladakh as "Great Tibet," thus ignoring the really Great Tibet altogether. The Balti call Gilgit "a Tibet," and Dr. Leitner says that the Chilasi call themselves Bories or Titans; but, although these districts may have their great differences, on the basis of that race, the ethnological frontier coincides with the geographical one given. Baltistan is a mass of lofty mountains, the prevailing formation being gneiss. In the north is the Baltoro glacier, the largest out of Tibet, and the largest of the benzna or tsonkaks whose highest peaks to the south are 25,000 and to the north 28,265 ft. The Indus, as in Lower Ladakh, runs in a narrow gorge, widening for nearly 20 m., after receiving the Shyok. The capital, Skardu, a scattered collection of houses, and a market town.

The house roofs are flat, occupied only in part by a second story, the remaining space being devoted to drying apricots, the chief staple of the main valley, which supports little cultivation. But the rapid slope westwards is seen generally in the vegetation. British plants, apricots, apples and Pinus excelsa appear; the lower level supports walnut, pomegranate, pear, peach, vine and melon, and where irrigation is available, as in the North Shigar, and at the deltas of the tributary valleys, the crops are more luxuriant and varied.

History.—The earliest notice of Ladakh is by the Chinese pilgrim Fa-hien, A.D. 400, who, travelling in search of a purer

faith, found Buddhism flourishing there; the only novelty to
him being the prayer-cylinder, the efficacy of which he declares
is incredible. Ladakh formed part of the Tibetan empire until
its disruption in the 10th century, and since then has continued
ecclesiastically subject, and sometimes tributary, to Lhasa.
its inaccessibility saved it from any Mussian invasion until
1531, when Sultan Said of Kashgar marched an army across
the Karakoram, one division fighting its way into Kashmir
and wintering there. Next year they invaded eastern Tibet,
where nearly all perished from the effects of the climate.
Early in the 17th century Ladakh was invaded by its Mahom-
median neighbours of Baltistan, who plundered and destroyed
the temples and monasteries; and again, in 1685-1686, by the Sokpa,
who were expelled only by the aid of the lieutenant of Auranzeb
in Kashmir, Ladakh thereafter becoming tributary. The gyalpo
or king then made a nominal profession of Islam, and abandoned
a mosque to be founded at Leh, and the Kashmiri have ever
since addressed his successors by a Mahomedan title. When
the Sikhs took Kashmir, Ladakh, dreading their approach, offered
allegiance to Great Britain. It was, however, conquered and
annexed in 1834-1841 by Gulab Singh of Jammu—the unwar-
like Ladakis, even with nature fighting on their side, and against
indifferent generalship, being no match for the Dogra troops.
These next turned their arms successfully against the Baltis
(who in the 18th century were subject to the Mogul), and were
then tempted to revive the claims of Ladakh to the Chinese
provinces of Rudok and Ngari. This, however, brought down
an army from Lhasa, and after a three days' flight the Indian
force was almost annihilated—chiefly indeed by frostbite and
other sufferings, for the battle was fought in mid-winter, 15,000
ft. above the sea. The Chinese then marched on Ladakh, but
were soon driven out again, and peace was finally made on the basis
of the old frontier. The widespread prestige of China is illustrated
by the fact that tribute, though disguised as a present, is paid
to her, for Ladakh, by the maharaja of Kashmir.

Kashmir Territories; Cunningham, Ladak; Major J. Biddulph, The
Tripes of the Hindoo Koosh; Ramsay, Western Tibet; Godwin-
(1884)); W. Lawrence, The Valley of Kashmir (1890); H. F.
Blandford, The Climate and Weather of India (1886). (T. H. H.)
LADD, GEORGE TRUMBULL (1842—), American philos-
opher, was born in Findsville, Lake county, Ohio, on the
19th of January 1842. He graduated at Western Reserve
College in 1864, and at Andover Theological Seminary in
1869; preached in Edinburg, Ohio, in 1869-1871, and in the Spring
Street Congregational Church of Milwaukee in 1871-1879;
and was professor of philosophy at Bowdoin College in 1879-
1881, and Clark professor of metaphysics and moral philosophy at
Harvard until 1881 till 1891, when he took charge of the graduate
department of philosophy and psychology, being professor emeritus in 1905. In 1879-1882 he lectured on theology at
Andover Theological Seminary, and in 1883 at Harvard, where
in 1895-1896 he conducted a graduate seminar in ethics. He
lectured in Japan in 1892, 1899 (when he also visited the uni-
versities of India) and 1906-1907. He was much influenced by
Lotze, whose Outlines of Philosophy he translated (6 vols., 1877).
and was one of the first to introduce (1879) the study of experi-
mental psychology into America, the Yale psychological
labouratory being founded by him.
Publications.—The Principles of Church Polity (1882); The
Doctrine of Sacred Scripture (1884); What is the Bible (1888); Essays
on the Higher Education (1899), defending the "old" (Yale) system
against the Harvard or "new" education, as praised by George H.
Palmer; Elements of Physiological Psychology (1889, rewritten as Out-
tlines of Descriptive Psychology (1894); Philosophy of Psychology (1894); Psychology, Descriptive and Explanatory (1894);
and Outlines of Descriptive Psychology (1898); in "system of philosophy," Philosophy of the Mind (1891); Philosophy of Knowledge (1897); A
Theological History of the Bible (1900); and Philosophy of
Religion (2 vols., 1905); In Korea with Marquis Ito (1908); and
Knowledge, Life and Reality (1909).
LADDER, (O. Eng. blader; of Teutonic origin, cf. Dutch leer,
Ger. Leiter; the ultimate origin is in the root seen in "lean,"
Gr. ἱππαῖος), a set of steps or "rungs" between two supports
to enable one to get up and down; usually made of wood and
sometimes of metal or rope. Ladders are generally movable,
and differ from a staircase also in having only treads and no
"risers." The term "Jacob's ladder," taken from the dream
of Jacob in the Bible, is applied to a rope ladder with wooden
steps used at sea to go aloft, and to a common garden plant of
the genus Polemonium on account of the ladder-like formation
of the leaves. The flower known in England as Solomon's
seal is in some countries called the "ladder of heaven."
LADING (from "to load," O. Eng. bladan, to put cargo on
board; cf. "load"), the document given as receipt
by the master of a merchant vessel to the consignor of
goods, as a guarantee for their safe delivery to the consignee.
(See Affreightment.)
LADISLAUS [L.], Saint (1042-1093), king of Hungary, the
son of Béla I., king of Hungary, and the Polish princess Richenza,
was born in Poland, whether his father had sought refuge,
but was recalled by his elder brother Andrew I. to Hungary
(1047) and brought up there. He succeeded to the throne
on the death of his uncle Geza in 1077, as the eldest member of
the royal family, and speedily won for himself a reputation
scarcely inferior to that of Stephen I., by nationalizing Christian-
ity and laying the foundations of Hungary's political greatness.
Instinctively recognizing that Germany was the natural enemy
of the Magyars, Ladislaus formed a close alliance with the pope
and all the other enemies of the emperor Henry IV., including
the anti-emperor Rudolph of Swabia and his chief supporter Welf,
duke of Bavaria, whose daughter Adelaide he married. She
bore him one son and three daughters, one of whom, Piriska,
made the Hungarian emperor John Connenus. The collapse
of the German emperor in his struggle with the pope left Ladislaus
freely to extend his dominions towards the south, and colonize
and Christianize the wildernesses of Transylvania and the lower
Danube. Hungary was still semi-savage, and her native barbar-
ians were being perpetually recruited from the hordes of Peche-
negs, Kumanians and other races which swept over her during
the 11th century. Ladislaus himself had fought valiantly
in his youth against the Pechenegs, and to defend the land
against the Kumanians, who now occupied Moldavia and Wallachia
as far as the Al, he built the fortresses of Turnu-Severin and
Gyula Fehérvár. He also planted in Transylvania the Szeklers,
the supposed remnant of the ancient Magyars from beyond the
Dnieper, and founded the bishoprics of Nagy-Várad, or Gross-
wardein, and of Agram, as fresh foci of Catholicism in south
Hungary and the hitherto uncultivated districts between the
Drave and the Tisza, the latter temporarily conquering Croatia,
though here his authority was questioned by the pope, the
Venetian republic and the Greek emperor. Ladislaus died
suddenly in 1055 when about to take part in the first Crusade.
No other Hungarian king was so generally beloved. The whole
nation mourned for him for three years, and regarded him as a
saint long before his canonization. A whole cycle of legends
is associated with his name.
See J. Babik, Life of St Ladislaus (Hun.) (Eger, 1862); György
Pray, Dissertatio de St Ladisloa (Pressburg, 1774); Antal Gándor,
Diss. hist. crit. de St Ladisloa (Vietina, 1775). (R. N. B.)
LADISLAUS IV., The Kumanian (1262-1290), king of Hungary,
was the son of Stephen V., whom he succeeded in 1272.
From his tenth year, when he was kidnapped from his father's court
by the rebellious vassals, till his assassination eighteen years
later, his whole life, with one bright interval of military glory
was unrelieved tragedy. His minority, 1272-1277, was an
alternation of palace revolutions and civil wars, in the course
of which his brave Kumanian mother Elizabeth barely contrived
to keep the upper hand. In this terrible school Ladislaus matured
precociously. At fifteen he was a man, resolute, spirited, enter-
prising, with the germs of many talents and virtues, but rough,
reckless and very imperfectly educated. He was married
betimes to Elizabeth of Anjou, who had been brought up at
the Hungarian court. The marriage was a purely political one,
arranged by his father and a section of the Hungarian magnates
to counterpoise hostile German and Czech influences. During
the earlier part of his reign, Ladislaus obscurely followed the direction of the Neapolitan court in foreign affairs. In Hungary itself a large party was in favour of the Germans, but the civil wars which raged between the two factions from 1276 to 1278 did not prevent Ladislaus, at the head of 20,000 Magyars and Kumanians, from co-operating with Rudolph of Habsburg in the great battle of Dunkrecht (August 26th, 1278), which destroyed, once for all, the empire of the Premyslides. A month later a papal legate arrived in Hungary to inquire into the conduct of the king, who was accused by his neighbours, and many of his own subjects, of adopting the ways of his Kumanian kinsfolk and thereby undermining Christianity. Ladislaus was not really a pagan, or he would not have devoted his share of the spoil of Dunkrecht to the building of the Franciscan church at Pressburg, nor would he have venerated as he did his aunt St Margaret. Political enmity was largely responsible for the movement against him, yet the result of a very careful investigation (1279–1281) by Philip, bishop of Fermo, mostranian, justified many of the accusations brought against Ladislaus. He clearly preferred the society of the semi-heathen Kumanians to that of the Christians; wore, and made his court wear, Kumanian dress; surrounded himself with Kumanian concubines, and neglected and ill-used his ill-favoured Neapolitan consort. He was finally compelled to take up arms against his Kumanian friends, whom he routed at Hodmező (May 1282) with fearful loss; but, previously to this, he had arrested the legate, whom he subsequently attempted to starve into submission, and his conduct generally was regarded as so unsatisfactory that, after repeated warnings, the Holy See resolved to supersede him by his Angevin kinsfolk, whom he had also alienated, and on the 8th of August 1285 Pope Nicholas IV. proclaimed a crusade against him. For the next two years all Hungary was convulsed by a horrible civil war, during which the unhappy young king, who fought for his heritage to the last with desperate valour, was driven from one end to the other like a hunted beast. On the 23rd of December 1289 he issued a manifesto to the lesser gentry, a large portion of whom sided with him, urging them to continue the struggle against the magnates and their foreign supporters; but on the 10th of July 1290 he was murdered in his camp at Korosseg by the Kumanians, who never forgive him for deserting them.

See Karoly Szabó, *Ladislaus the Cumanian* (Hung.), (Budapest, 1886); and Acsády, *History of the Hungarian Realm*, i. 2 (Budapest, 1903). The latter is, however, too favourable to Ladislaus.

(R. N. B.)

**LADISLAUS V.** (1440–1457), king of Hungary and Bohemia, the only son of Albert, king of Hungary, and Elizabeth, daughter of the emperor Sigismund, was born at Komróm on the 22nd of February 1440, four months after his father's death, and was hence called Ladislaus Posthumus. The estates of Hungary had already elected Wladislaus III. of Poland their king, but Ladislaus's mother caused the holy crown to be stolen from its guardians at Visegrad, and compelled the primate to crown the infant king at Székesfejővár on the 15th of May 1440; whereupon, for safety's sake, she placed the child beneath the guardianship of his uncle the emperor Frederick III. On the death of Wladislaus III. (Nov. 10th, 1444), Ladislaus V. was elected king by the Hungarian estates, though not without considerable opposition, and a deputation was sent to Vienna to induce the emperor to surrender the child and the holy crown; but it was not till 1452 that Frederick was compelled to relinquish both. The child was then transferred to the pernicious guardianship of his maternal grandfather Ulrich Cillei, who corrupted him soul and body and inspired him with a jealous hatred of the Hunyadis. On the 28th of October 1453 he was crowned king of Bohemia, and henceforth spent most of his time at Prague and Vienna. He remained supinely indifferent to the Turkish peril; at the instigation of Cillei, did his best to hinder the defensive preparations of the great Hunyadi, and fled from the country on the tidings of the siege of Belgrade. On the death of Hunyadi he made Cillei governor of Hungary at the diet of Futtak (October 1456), and when that traitor paid with his life for his murderous attempt on Laszló Hunyadi at Belgrade, Ladislaus procured the decapitation of young Hunyadi (15th of March 1457), after a mock trial which raised such a storm in Hungary that the king fled to Prague, where he died suddenly (Nov. 23rd, 1457), while making preparations for his marriage with Magdalena, daughter of Charles VII. of France. He is supposed to have been poisoned by his political opponents in Bohemia.

**LA DIXERIE, NICOLAS BRICAIRE DE** (c. 1730–1791), French man of letters, was born at Lamothe (Haute-Marne). While still young he removed to Paris, where the rest of his life was spent in literary activity. He died on the 26th of November 1791. His numerous works include *Contes philosophiques et moraux* (1765), *Les Deux Âges du goût et du génie sous Louis XIV. et sous Louis XV.* (1769), a parallel and contrast, in which the decision is given in favour of the latter; *L'Espagne littéraire* (1774); *Éloge de Voltaire* (1779) and *Éloge de Montaigne* (1781).

**LADO ENCLAVE**, a region of the upper Nile formerly administered by the Congo Free State, but since 1910 a province of the Anglo-Egyptian Sudan. It has an area of about 15,000 sq. m., and a population estimated at 250,000 and consisting of Bari, Madi, Kuku and other Nilotic Negros. The enclave is bounded S.E. by the north-west shores of Albert Nyanza—as far south as the port of Mahagi—E. by the western bank of the Nile (Bahr-el-Jebel) to the point where the river is intersected by 5° 30' N., which parallel forms its northern frontier from the Nile westward to 30° E. This meridian forms the west frontier to 4° N., the frontier thence being the Nile-Congo watershed to the point nearest to Mahagi and from that point direct to Albert Nyanza. The country is a moderately elevated plateau sloping northward from the higher ground marking the Congo-Nile watershed. The plains are mostly covered with bush, with stretches of forest in the northern districts. Travelling the plateau are two parallel mountainous chains having a general north to south direction. One chain, the Kuku Mountains (average height 2000 ft.), approaches close to the Nile and presents, as seen from the river, several apparently isolated peaks. At other places these mountains form precipices which stretch in a continuous line like a huge wall. From Dufiile in 3° 34' N. to below the Bedden Rapids in 4° 40' N. the bed of the Nile is much obstructed and the river throughout this reach is un navigable (see Nile). Below the Bedden Rapids rises the conical hill of Rejaf, and north of that point the Nile valley becomes flat. Ranges of hill, however, are visible farther westwards, and a little north of 5° N. is Jebel Lado, a conspicuous mountain 2500 ft. high and some 12 m. distant from the Nile. It has given its name to the district, which the south hill runs from the Nile in the ascent of some 1000 m. from Khardtum. On the river at Rejaf, at Lado, and at Kiro, 28 m. N. of Lado, are government stations and trading establishments. The western chain of hills has loftier peaks than those of Kuku, Jebel Loka being about 3000 ft. high. This western chain forms a secondary watershed separating the basin of the Nile, a large river, some 400 m. in length, which runs almost due north to join the Nile, from the other streams of the enclave, which have an easterly or north-easterly direction and join the Nile after comparatively short courses.

The northern part of the district was first visited by Europeans in 1841–1842, when the Nile was ascended by an expedition despatched by Mehemet Ali to the foot of the rapids at Bedden. The neighbouring posts of Gondokoro, on the east bank of the Nile, and Lado, soon became stations of the Khartum ivory and slave traders. After the discovery of Albert Nyanza by Sir Samuel Baker in 1864, the whole country was overrun by Arabs, Levantines, Turks and others, whose chief occupation was slave raiding. The region was claimed as part of the Egyptian Sudan, but it was not until the arrival of Sir Samuel Baker at Gondokoro in 1870 as governor of the equatorial provinces, for a spell with the dual role of governor and district commissioner. While on a mission to the north, in 1871, Baker was captured by the French, who, in turn, released him under the Treaty of London, which confirmed Baker's claims to the region.
that any effective control of the slave traders was attempted. Baker was succeeded by General C. G. Gordon, who established a separate administration for the Bahrl-el-Ghazal. In 1878 Emn Pasha became governor of the Equatorial Province, a term henceforth confined to the region adjoining the main Nile above the Sobat confluence, and the region south of the Bahrl-el-Ghazal province. (The whole of the Lado Enclave thus formed part of Emn's old province.) Emn made his headquarters at Lado, whence he was driven in 1883 by the Mahdists. He then removed to Wadelin, a station farther south, but in 1889 the pasha, to whose aid H. M. Stanley had conducted an expedition from the Congo, evacuated the country and with Stanley made his way to the east coast. While the Mahdists remained in possession at Rejaf, Great Britain in virtue of her position in Uganda claimed the upper Nile region as within the British sphere; a claim admitted by Germany in 1890. In February 1894 the union jack was hoisted at Wadelin, while in May of the same year Great Britain granted to Leopold II., as sovereign of the Congo State, a lease of large areas lying west of the upper Nile inclusive of the Bahrl-el-Ghazal and Fashoda. Pressed however by France, Leopold II. agreed to occupy only that part of the leased area east of 30° E. and south of 3°50', and in this manner the actual limits of the Lado Enclave, as it was thereafter called, were fixed. Congo State forces had penetrated to the Nile valley as early as 1891, but it was not until 1897, on the 17th of February Commandant Chaltin inflicted a decisive defeat on the Mahdists at Rejaf, that their occupation of the Lado Enclave was assured. After the withdrawal of the French from Fashoda, Leopold II. revived (1899) his claim to the whole of the area, leased to him in 1894. In this claim he was unsuccessful, and the lease, by a new agreement made with Great Britain in 1906, was annulled (see Africa, § 9). The king however retained the enclave, with the stipulation that six months after the termination of the lease it should be handed over to the Anglo-Sudanese government (see Treaty Secr. No. 136, 1906).

See Le Mouvement géographique (Brussels) passim, and especially articles in the 1910 issues.

LADOGA (formerly NEVO), a lake of northern Russia, between 59° 56' and 61° 46' N., and 29° 53' and 32° 39' E., surrounded by the governments of St Petersburg and Olonets, and of Viborg in Finland. It has the form of a quadrilateral, elongated from N.W. to S.E. Its eastern and southern shores are flat and marshy, the north-western craggy and fringed by numerous small rocky islands, the largest of which are Valamo and Konnevitz, together having an area of 14 sq. m. Ladoga is 7000 sq. m. in area, that is, thirty-six times larger than the Lake of Geneva; but its depth being less, it contains only nineteen times as much water as the Swiss lake. The greatest depth, 730 ft., is in a trough in the north-western part, the average depth not exceeding 250 to 350 ft. The level of Lake Ladoga is 55 ft. above the Gulf of Finland, but it rises and falls about 7 ft., according to atmospheric conditions, a phenomenon very similar to the seiches of the Lake of Geneva being observed in connexion with this.

The western and eastern shores consist of boulder clay, as well as a narrow strip on the southern shore, south of which runs a ridge of crags of Silurian sandstones. The hills of the north-western shore afford a variety of granites and crystalline slates of the Laurentian system, whilst Valamo island is made up of a rock which Russian geologists describe as orthoclastic hyperthene. The granite and marble of Serdobol, and the sandstone of Putilovo, are much used for buildings at St Petersburg; copper and tin from the Pitkäpelä mines are also exported.

No fewer than seventy rivers enter Ladoga, pouring into it the waters of numberless smaller lakes which lie at higher levels round it. The Volkov, which conveys the waters of Lake Vologda; the Neva, which flows from Lake Ladoga into the waters of the Svir; and the Saima system of lakes of eastern Finland contribute the Vuoxen and Taipale rivers; the Syas brings the waters from the smaller lakes and marshes of the Valdai plateau. Ladoga also serves as a waterway for the trade of the Neva, which flows from its south-western corner into the Gulf of Finland, rolling down its broad channel 104,000 cubic ft. of water per second.

The water of Ladoga is very pure and cold; in May the surface temperature does not exceed 50F., and even in August it reaches only 59° and 53°, the average yearly temperature of the air at Valamo being 36°-8. The lake begins to freeze in October, but it is only about the end of December that it is frozen in its deeper parts; and it remains ice-bound until the end of March, though broad ice-bergs are so large as to float in the middle of the lake until April by gales. Only a small part of the Ladoga ice is discharged by the Neva; but it is enough to produce in the middle of June a return of cold in the northern capital. The thickness of the ice does not exceed 3 ft., but, during the alterations of cold and warm gales, with strong gales, in winter, stacks of ice, 70 and 80 ft. high, are raised on the shores and on the icefields. The water is in continuous rotatory motion, being carried along the western shore from north to south by the Lado, and along the eastern shore, thence to the Gulf of Finland.

Fishing is very extensively carried on. Navigation, which is limited for only one hundred and eighty days in the year, is rather difficult owing to fogs and gales, which are often accompanied, even in April and September, with snow-storms. The prevailing winds blow from N.W. and S.W., and cause the water to rise in the south-western part of the lake by from 10 ft. to 15 ft. Swell and plagues regularly in two directions from St Petersburg—to the monasteries of Konnevitz and Valamo, and to the mouth of the Svir, whence they go up that river to Lake Onega and Petrozavodsk; and small vessels transport timber (600,000 ft.), planks (15,000,000 ft.), malt, local wines, and various small wares from the northern shore to Schvæblülsburg, and thence to St Petersburg. Navigation on the lake being too dangerous for small craft, canals with an aggregate length of 104 m. were dug in 1864 to 1873, and have a mean width of 80 ft., and are made up of an aggregate length of 104 m. along its southern shore, uniting with the Neva at Schvæblülsburg the mouths of the rivers Volkov, Syas and Svir, all links in the elaborate system of canals which connect the upper Volga with the Gulf of Finland.

The population (35,000) on the shores of the lake is sparse, and the towns—Schvæblülsburg (5285 inhabitants in 1897); New Ladoga (4144); Kexholm (1352) and Serdobol—are small. The monasteries of Valamo, on the south shore, of Lady Day on the middle of the lake between Ladoga and Onega, and of Konnevitz, on Konnevitz island, founded in 1393, are visited every year by many thousands of pilgrims. (F. A. K., J. T. B.)

LADY (O. Eng. hlæfdigæ, Mid. Eng. hlæfdi, hlævedi; the first part of the word is hlæf, loaf, bread, as in the corresponding hlæfdær, lord; the second part is usually taken to be from the root dig-, to knead, seen also in “dough” ; the sense development from bread-kneader, bread-maker, to the ordinary meaning, though not clearly to be traced historically, may be illustrated by that of “lord”), a term of which the main applications are two, (1) as the correlative of “lord” (q.v.) in certain of the usages of that word, (2) as the correlative of “gentleman” (q.v.). The primary meaning of mistress of a household is, if not obsolete, in present usage only a vulgarism. The special use of the word as a title of the Virgin Mary, usually “Our Lady,” represents the Lat. Domina Nostra. In Lady Day and Lady Chapel the word is properly a genitive, representing the O. Eng. hlæfdigrnan. As a title of nobility the uses of “lady” are mainly paralleled by those of “lord.” It is thus a less formal alternative to the full title giving the specific rank, of marchioness, countess, viscountess or baroness, whether as the title of the husband’s rank by right or courtesy, or as the lady’s title in her own right. In the case of the younger sons of a duke or marquess, who by courtesy have lord prefixed to their Christian and family name, the wife is known by the husband’s Christian and family name with Lady prefixed, e.g. Lady John B.; the daughters of dukes, marquesses and earls are by courtesy Ladies; here that title is prefixed to the Christian and family name of the lady, e.g. Lady Mary B., and this is preserved if the lady marry a commoner, e.g. Mr and Lady Mary C. “Lady” is also the customary title of the wife of a baronet or knight; the proper title, now only used in legal documents or on sepulchral monuments, is “dame” (q.v.); in the latter case the usage is to prefix Dame to the Christian name of the wife followed by the surname of the husband, thus Bessie Eleanor B., Jane. In the former, Lady, with the surname of the husband only, Sir A. and Lady B. During the 15th and 16th centuries “princesses” or daughters of the blood royal were usually known by their Christian names with “the Lady” prefixed, e.g. the Lady Elizabeth.
While "lord" has retained its original application as a title of nobility or rank without extension, an example which has been followed in Spanish usage by "don," "lady" has been extended in meaning to be the feminine correlative of "gentleman" throughout its sense developments, and in this is paralleled by Dame in German, madame in French, donna in Spanish, &c. It is the general word for any woman of a certain social position (see Gentleman).

LADYBANK, a police borough of Fifeshire, Scotland, 57 m. S.W. of Cumnor by the North British railway, ½ m. from the left bank of the Eden. Pop. (1901) 3400. Besides having a station on the main line to Dundee, it is also connected with Perth and Kinross and is a railway junction of some importance and possesses a locomotive depot. It is an industrial centre, linen weaving, coal mining and malting being the principal industries.

KETTLE, a village 1 m. S., has prehistoric bars and a fort. At Collesse, 23 m. N. by W., a standing stone, a mound and traces of ancient camps exist, while urns and coins have been found. Between the parishes of Collesse and Monimail the boundary line takes the form of a crescent known as the Bow of Fife. MONMAIL contains the Mount, the residence of Sir David Lindsay the poet (1400-1555). Its lofty site is now marked by a drum of trees. Here, too, is the Doric pillar, 100 ft. high, raised to the memory of John Hope, 4th earl of Hopetoun. Melville House, the seat of the earls of Leven, lies amidst beautiful woods.

LADYBRAND, a town of the Orange Free State, 80 m. E. of Bloemfontein by rail. Another railway connects it with Natal via Harrismith. Pop. (1904) 3862, of whom 2334 were whites. The town is pleasantly situated at the foot of a flat-topped hill (the Platberg), about 4 m. W. of the Caledon river, which separates the province from Basutoland. Ladybrand is the centre of a rich arable district, has a large wheat market and is also a health resort, the climate, owing to the proximity of the Maluti Mountains, being bracing even during the summer months (November-March). Coal and petroleum are found in the neighbourhood. It is named after the wife of Sir J. H. Brand, president of the Orange Free State.

LADY-CHAPEL, the chapel dedicated to the Blessed Virgin and attached to churches of large size. Generally the chapel was built eastward of the high altar and formed a projection from the main building, as in Winchester, Salisbury, Exeter, Wells, St Albans, Chichester, Peterborough and Norwich cathedrals,—in the two latter cases now destroyed. The earliest Lady-chapel built was that in the Saxon cathedral of Canterbury; this was transferred in the rebuilding by Archbishop Lanfranc to the west end of the nave, and again shifted in 1430 to the chapel on the east side of the north transept. The Lady-chapel at Ely cathedral is a distinct building attached to the north transept; at Rochester the Lady-chapel is west of the south transept. Probably the largest Lady-chapel was that built by Henry III. in 1220 at Westminster Abbey, which was 30 ft. wide, much in excess of any foreign example, and extended to the end of the site now occupied by Henry VII.'s chapel. Among other notable English examples of Lady-chapels are those at Ottery-St-Mary, Thetford, Bury St Edmund's, Wimborne, Christchurch, Hampshire; in Compton Church, Surrey, and Compton Martin, Somersetshire, and Darenth, Kent, it was built over the chancel. At Croyland Abbey there were two Lady-chapels. Lady-chapels exist in most of the French cathedrals and churches, where they form part of the ch.et; in Belgium they were not introduced before the 14th century; in some cases they are of the same size as the other chapels of the ch.et; but in others, probably rebuilt at a later period, they became much more important features, and in Italy and Spain during the Renaiss ance period they form some of its best examples.

LADY DAY, originally the name for all the days in the church calendar marking any event in the Virgin Mary's life, but now restricted to the feast of the Annunciation, held on the 25th of March in each year. Lady Day was in medieval and later times the beginning of the legal year in England. In 1752 this was altered to the 1st of January, but the 25th of March remains one of the Quarter Days; though in some parts old Lady Day, on the 6th of April, is still the date for rent paying. See Annunciation.

LADYSMITH, a town of Natal, 180 m. N.W. of Durban by rail, on the left bank of the Klip tributary of the Tugela. Pop. (1904) 5508, of whom 2260 were whites. It lies 328 ft. above the sea and is encircled by hills, while the Drakensberg are some 30 m. distant to the N.W. Ladysmith is the trading centre of northern Natal, and is the chief railway junction in the province, the main line from the south dividing here. One line crosses Van Reenen's pass into the Orange Free State, the other runs northwards to the Transvaal. There are extensive railway workshops. Among the public buildings are the Anglican church and the town hall. The church contains a tablet with the names of 3200 men who perished in the defence and relief of the town in the South African War (see below), while the clock tower of the town hall, partially destroyed by a Boer shell, is kept in its damaged condition.

Ladysmith, founded in 1851, is named after Juana, Lady Smith, wife of Sir Harry Smith, then governor of Cape Colony. It stands near the site of the camp of the Dutch farmers who in 1848 assembled for the purpose of trecking across the Drakensberg. Here they were visited by Sir Harry Smith, who induced the majority of the farmers to remain in Natal. The growth of the town, at first slow, increased with the opening of the railway from Durban in 1886 and the subsequent extension of the line to Johannesburg.

In the first and most critical stage of the South African War of 1899-1902 (see Transvaal) Ladysmith was the centre of the struggle. During the British concentration on the town there were fought the actions of Talana (or Dundee), in the Elandslangte on the 21st and Kiefontein on the 24th of October 1899. On the 30th of October the British sustained a serious defeat in the general action of Lombard's Kop or Farquhar's Farm, and Sir George White decided to hold the town, which had been fortified, against investment and siege until he was relieved directly or indirectly by Sir Redvers Buller's advance. The greater portion of Buller's available troops were despatched to Natal in November, with a view to the direct relief of Ladysmith, which meantime the Boers had closely invested. His first attempt was repelled on the 15th of December in the battle of Colenso, his second on the 24th of January 1900 by the successful Boer counter-stroke against Spion Kop, and his third was abandoned without serious fighting (Vaalkrantz, Feb. 3). But two or three days after Vaalkrantz, almost simultaneously with Lord Roberts's advance on Bloemfontein Sir Redvers Buller resumed the offensive in the hills to the east of Colenso, which he gradually cleared of the enemy, and although he was checked after reaching the Tugela below Colenso (Feb. 24) he was finally successful in carrying the Boer positions (Pieter's Hill) on the 27th and relieving Ladysmith, which during these long and anxious months (Nov. 1-Feb. 28) had suffered very severely from want of food, and on one occasion (Caesar's Camp, Jan. 6, 1900) had only with heavy losses and great difficulty repelled a powerful Boer assault. The garrison displayed its unbroken resolution on the last day of the investment by setting on foot a mobile column, composed of all men who were not too enfeebled to march out, in order to harass the Boer retreat. This expedition was however countermanded by Buller.

LAELIUS, the name of a Roman plebeian family, probably settled at Tibur (Tivoli). The chief members were:

GAIUS LAELIUS, general and statesman, was a friend of the elder Scipio, whom he accompanied on his Spanish campaign (218-206 B.C.). In Scipio's consulsipship (203), Laelius went with him to Sicily, whence he conducted an expedition to Africa. He defeated the Massacyan prince Syphax, who, breaking his alliance with Scipio, had joined the Carthaginians, and at Zama (202) rendered considerable service in command of the cavalry. In 197 he was plebeian aedile and in 196 prae tor of Sicily. As consul in 190 he was employed in organizing the recently conquered territory in Cisalpine Gaul. Placentia and Cremona were repeopled, and a new colony founded at Bononia.
He is last heard of in 170 as ambassador to Transalpine Gaul. Though little is known of his personal qualities, his intimacy with Scipio is proof that he must have been a man of some importance. Silius Italicus (Punicus, xv, 450) describes him as a man of great endowments, an eloquent orator and a brave soldier.

See Index to Livy; Polybius x. 9, 39, xi. 32, xiv. 4, 8, xv. 9, 12, 14; Appian, Hær. 25-29; Cicero, Philippica, xi. 7.

His son, GAIUS LAELIUS, is known chiefly as the friend of the younger Scipio, and as one of the speakers in Cicero’s De senectute, De amicitia (or Laelius) and De Republica. He was surnamed Sapiens (‘the wise’), either from his scholarly tastes or because, when tribune, he ‘prudently’ withdrew his proposal (151 B.C.) for the relief of the farmers by distributions of land, when he saw that it was likely to bring about disturbances. In the third Punic War (147) he accompanied Scipio to Africa, and distinguished himself at the capture of the Cothon, the military harbour of Carthage. In 143 he carried on operations with moderate success against Virithius in Spain; in 140 he was elected consul. During the Gracchan period, as a staunch supporter of Scipio and the aristocracy, Laelius became associated with the democrats. He was associated with P. Popillius Laenas in the prosecution of those who had supported Tiberius Gracchus, and in 131 opposed the bill brought forward by C. Papirius Carbo to render legal the election of a tribune to a second year of office. The attempts of his enemies, however, failed to shake his reputation. He was a highly accomplished man and belonged to the so-called ‘Scipionic circle.’ He studied philosophy under the Stoics Diogenes Babylonius and Panaetius of Rhodes; he was a poet, and the plays of Terence, by reason of their elegance of diction, were sometimes attributed to him. With Scipio he was mainly instrumental in introducing the study of the Greek language and literature into Rome. He was a gifted orator, though his refined eloquence was perhaps less suited to the forum than to the senate. He delivered speeches De Colegiis (145) against the proposal of the tribune C. Licinius Crassus to deprive the pious colleges of their right of co-optation and to transfer the power of election to the people; Pro Publicanis (139), on behalf of the farmers of the revenue; against the proposal of Carbo noticed above; Pro Se, a speech in his own defence, delivered in answer to Carbo and Gracchus; funeral orations, amongst them two on his friend Scipio. Much information is given concerning him in Cicero, who compares him to Socrates.

See Index to Cicero; Plutarch, Tib. Graccus, 8; Appian, Punicus, 126; Horace, Sat. ii. 1. 72; Quintilian, Inst. xii. 10. 10; Suetonius, Vida Terentii; Terence, Adelphi, Prolog. 15, with the commentators.

LAENAS, the name of a plebeian family in ancient Rome, notorious for cruelty and arrogance. The two most famous of the name are:

GAIUS POPILLIUS LAENAS, consul in 172 B.C. He was sent to Greece in 174 to allay the general dissatisfaction, but met with little success. He took part in the war against Perseus, king of Macedon (Livy xlviii. 17, 22). When Antiocbus Epiphanes, king of Syria, invaded Egypt, Laenas was sent to arrest his progress. Meeting him near Alexandria, he handed him the decree of the senate, demanding the evacuation of Egypt. Antiocbus having asked time for consideration, Laenas drew a circle round him with his staff, and told him he must give an answer before he stepped out of it. Antiocbus thereupon submitted (Livy xlv. 12; Polybius xxix. 11; Cicero, Philippica, viii. 8; Vell. Pat. i. 10).

PUFFUS PUBILLUS LAENAS, son of the preceding. When consul in 132 B.C. he incurred the hatred of the democrats by his harsh measures as head of a special commission appointed to take measures against the accomplices of Tiberius Gracchus. In 123 Gaius Gracchus brought in a bill prohibiting all such commissions, and declared that, in accordance with the old laws of appeal, a magistrate who pronounced sentence of death against a citizen, without the people’s assent, should be guilty of high treason. It is not known whether the bill contained a retrospective clause against Laenas, but he left Rome and sentence of banishment from Italy was pronounced against him. After the restoration of the aristocracy the enactments against him were cancelled, and he was recalled (121).

See Cicero, Brutus, 25. 34. and De domo sua, 31; Vell. Pat. ii. 7; Plutarch, C. Gracchus, 4.

LAER (or LAAR), PIETER VAN (1613-c. 1675), Dutch painter, was born at Laarzen in Holland. The influence of a long stay in Rome begun at an early age is seen in his landscape and backgrounds, but in his subjects he remained true to the Dutch tradition, choosing generally lively scenes from peasant life, as markets, feasts, bowling scenes, farriers’ shops, robbers, hunting scenes and peasants with cattle. From this taste, or from his personal deformity, he was nicknamed Bamboccio by the Italians. On his return to Holland about 1630, he lived chiefly at Amsterdam and Haarlem, in which latter city he died in 1674 or 1675. His pictures are marked by skilful composition and good drawing; he was especially careful in perspective. His works, which are now in the Rijksmuseum at Amsterdam, contain very clear, but oftener heavy, and his execution broad and spirited.” Certain etched plates are also attributed to him.

LAESTRYGONES, a mythical race of giants and cannibals. According to the Odyssey (x. 80) they dwelt in the farthest north, where the nights were so short that the shepherd who was driving out his flock met another driving it in. This feature of the tale contains some hint of the long nightless summer in the Arctic regions, which perhaps reached the Greeks through the merchants who fetched amber from the Baltic coasts. Odysseus in his wanderings arrived at the coast inhabited by the Laestrygones, and escaped with only one ship, the rest being sunk by the giants with masses of rock. Their chief city was Telepylus, founded by a former king Lamus, their ruler at that time being Antiphates. This is a purely fanciful name, but Lamus takes us into a religious world where we can trace the origin of the legend, and observe the god of an older religion becoming the subject of fairy tales (see Lamia) in a later period.

The later Greeks placed the country of the Laestrygones in Sicily, to the south of Aetna, near Leonia; but Horace (Odes, iii. 16. 22) and other Latin authors speak of them as living in southern Latium, near Formiae, which was supposed to have been founded by Lamus.

LAETUS, JULIUS POMPONIUS [Giulio Pomponio Lelo], (1425-1498), Italian humanist, was born at Salerno. He studied at Rome under Laurentius Valla, whom he succeeded (1457) as professor of eloquence in the Gymnasium Romanum. About this time he founded an academy, the members of which adopted Greek and Latin names, met on the Quirinal to discuss classical questions and celebrated the birthday of Romulus. Its constitution resembled that of an ancient priestly college, and Laetus was styled pontifex maximus. The pope (Paul II.) viewed these proceedings with suspicion, as savouring of paganism, heresy and republicanism. In 1468 twenty of the academicians were arrested during the carnival; Laetus, who had taken refuge in Venice, was sent back to Rome, imprisoned and put to the torture, but refused to plead guilty to the charges of infidelity and impiety. For want of evidence, he was acquitted and allowed to resume his professorial duties; but it was forbidden to utter the name of the academy even in jest. Sixtus IV. permitted the resumption of its meetings, which continued to be held till the sack of Rome (1527) by Constable Bourbon during the papacy of Clement VII. Laetus continued to teach in Rome until his death on the 9th of June 1498. As a teacher, Laetus, who has been called the first head of a philological school, was extraordinarily successful; in his own words, like Socrates and Christ, he expected to live on in the person of his pupils, amongst whom were many of the most famous scholars of the period. His works, written in pure and simple Latin, were published in a collected form (Opera Pomponii Laeti varia, 1521). They contain treatises on the Roman magistrates, priests and lawyers, and a compendium of Roman history from
the death of the younger Gordian to the time of Justin III. Laetus also wrote commentaries on classical authors, and promoted the publication of the edict of the empress of Virgil at Rome in 1469.

See The Life of Leto by Sabellius (Strassburg, 1510); G. Voigt, Die Wiedervereinigung des klassischen Alterthums, ii.; F. Gregorovius, Geschichte der Stadt Rom im Mittelalter, vii. (1894), p. 576, for an account of the academy; Sandys, History of Classical Scholarship (1908), ii. 92.

LAEVUS (c. 80 b.c.), a Latin poet of whom practically nothing is known. The earliest reference to him is perhaps in Suetonius (De grammaticis, 3), though it is not certain that the Laevius Milusus there referred to is the same person. The reference is before the third century (Fronto, Ep. ad M. Caes. i. 3; Aulus Gellius, Noct. Att. ii. 24, xii. 10, xix. 9; Apuleius, De magia, 30; Porphyrian, Ad Horat. carm. iii. 1, 2). Some sixty miscellaneous lines are preserved (see Bährrens, Fragn. poet. rom. pp. 287-293), from which it is difficult to see how ancient critics could have regarded him as the master of Ovid or Catullus. Gellius and Ausonius state that he composed an Erotopeagia, and in other sources he is credited with Adonis, Alectis, Centauri, Helena, Ino, Poetae Satyriam, Sirencirca, Phoenix, which, however, may be but the parts of the Erotopeagia. They were not serious poems, but light and often licentious skits on the heroic myths.

See O. Ribbeck, Geschichte der römischen Dichtung, i.; H. de la Ville Miro, Étude biographique et littéraire sur le poète Laevius (Paris, 1900), with critical ed. of the fragments, and remarks on vocabulary and syntax; A. Weichert, Poetarum latinorum reliquiae (Leipzig, 1839); M. Schanz, Geschichte der römischen Litteratur (2nd ed.), pt. 1, p. 163; W. Teuffel, Hist of Roman Literature (Eng. tr.), § 150, 4; a convenient summary in F. Plessis, La Poésie latine (1909), pp. 139-142.

LAEVULIC ACID (β-acetopropionic acid), C₆H₁₀O₃, or CH₂CO-CH₂-CO₂H, a ketonic acid prepared from laevulose, inulin, starch, &c., by boiling them with dilute hydrochloric or sulphuric acids. It may be synthesized by condensing sodium acetocetate with monochloroacetic ester, the aceticoxocinest ester produced being then hydrolysed with dilute hydrochloric acid (M. Conrad, Ann., 1877, 188, p. 222).

CH₂O·CO·CH₂·CO₂H \rightarrow CO₂R \rightarrow CH₂CO₂CH₂·CO₂H

It may also be prepared by heating the anhydride of γ-methylol-γ-glutaric acid with concentrated sulphuric acid, and by oxidation of methyl heptene and of geranial. It crystallizes in plates, which melt at 32-5 to 35°C. and boil at 142-144°C. (15 mm.) (A. Michael, Jour. prak. Chem., 1891 [2], 44, p. 114). It is readily soluble in alcohol, ether and water. The acid, when distilled slowly, is decomposed and yields α and β-angelica lactones. When heated with hydriodic acid and phosphorus, it yields N-valeric acid; and with iodine and caustic soda solution it gives iodoxol, even in the cold. With hydroxyamine it yields an oxime, which by the action of concentrated sulphuric acid rearranges itself to N-methylsuccinimide (CH₂COO-NH₂).

LA FARGE, JOHN (1835-1910), American artist, was born in New York, on the 31st of March 1835, of French parentage. He received instruction in drawing from his grandfather, Binse de St Victor, a painter of miniatures; studied law and architecture; entered the atelier of Thomas Couture in Paris, where he remained a short time, giving special attention to the study and copying of old masters at the Louvre; and began by making illustrations to the poets (1859). An intimacy with the artist William M. Hunt had a strong influence on him, the two working together at Newport, Rhode Island. La Farge painted landscape, still life and figure alike in the early sixties. But from 1866 on he was for some time incapacitated for work, and when he regained strength he did some decorative work for Trinity church, Boston, in 1876, and turned his attention to stained glass, becoming president of the Society of Mural Painters. Some of his important commissions include windows for St Thomas's church (1877), St Peter's church, the Paulist church, the Brick church (1882), the churches of the Incarnation (1885) and the Ascension (1887), New York; Trinity church, Buffalo, and the “Battle Window” in Memorial Hall at Harvard; ceilings and windows for the house of Cornelius Vanderbilt, windows for the houses of W. H. Vanderbilt and D. O. Mills, and panels for the house of Whitelaw Reid, New York; panels for the Congressional Library, Washington; Bowdoin College, the Capitol at St Paul, Minn., besides designs for many stained glass windows. He was also a prolific painter in oil and water colour, the latter seen notably in some water-colour sketches, the result of a voyage in the South Seas, shown in 1895. His influence on American art was powerfully exhibited in such men as Augustus St Gaudens, Wilton Lockwood, Francis Lathrop and John Humphreys Johnston. He became president of the Society of American Artists, a member of the National Academy of Design in 1886; an officer of the Legion of Honour of France; and received many medals and decorations. He published Considerations on Painting (New York, 1891); Hokasai: A Talk about Hokasai (New York, 1897); and An Artist's Letters from Japan (New York, 1897).

See Cecilia Weir, La Farge, Artist and Writer (London, 1866, No. 26 of The Portfolio).

LA FARINA, GIUSEPPE (1815-1863), Italian author and politician, was born at Messina. On account of the part he took in the insurrection of 1837 he had to leave Sicily, but returning in 1839 he conducted various newspapers of liberal tendencies, until his efforts were completely interdicted, when he removed to Florence. In 1840 he had published Messina ed i suoi monumenti, and after his removal to Florence he brought out La Germania coi suoi monumenti (1842), L'Italia coi suoi monumenti (1842), La Storia storica ed artistica (1842-1843), La Chine, 4 vols. (1843-1847), and Storia d'Italia, 7 vols. (1846-1854). In 1845 he established at Florence a democratic journal, L'Alba, in the interests of Italian freedom and unity, but on the outbreak of the revolution in Sicily in 1848 he returned thither and was elected deputy and member of the committee of war. In August of that year he was appointed minister of public instruction and later of war and marine. After vigorously conducting a campaign against the Bourbon troops, he was forced into exile, and repaired to France in 1849. In 1850 he published his Storia documentata della Rivoluzione Siciliana del 1848-1849, and in 1851-1852 his Storia d'Italia dal 1815 al 1838, in 6 vols. He returned to Italy in 1854 and settled at Turin, and in 1856 he founded the Piccolo Corriere d'Italia, an organ which had great influence in propagating the political sentiments of the Società Nazionale Italiana, of which he ultimately was chosen president. With Daniele Manin (q.v.), one of the founders of that society, he advocated the unity of Italy under Victor Emmanuel even before Cavour, with whom at one time he had daily interviews, and organized the emigration of volunteers from all parts of Italy into the Piedmontese army. He also negotiated an interview between Cavour and Garibaldi, with the result that the latter was appointed commander of the Cacciatori delle Alpi in the war of 1859. Later he supported Garibaldi's expedition to Sicily, where he himself went soon after the occupation of Palermo, but he failed to bring about the immediate annexation of the island to Piedmont as Cavour wished. In 1866 he was chosen a member of the first Italian parliament and was subsequently made councillor of state. He died on the 5th of September 1863.

LA FAYETTE, GILBERT MOTIER DE (1766-1802), marshal of France, was brought up at the court of Louis II., 3rd duke of Bourbon. He served under Marshal Boucault in Italy, and on his return to France after the evacuation of Genoa in 1499 became seneschal of the Bourbons. In the English wars he was with John I., 4th duke of Bourbon, at the capture of Soubise in 1413, and of Compiegne in 1415. The duke then made him lieutenant-general in Languedoc and Guienne. He failed to defend Caen and Falaise in the interest of the dauphin (afterwards Charles VII.) against Henry V. in 1417 and 1418, but in the latter year he held Lyons for some time against Jean sans Peur, duke of Burgundy. A series of successes over the English
and Burgundians on the Loire was rewarded in 1420 with the government of Dauphiné and the office of marshal of France. La Fayette commanded the Franco-Scottish troops at the battle of Bauçé (1422), though he did not, as has been sometimes stated, slay Thomas, duke of Clarence, with his own hand. In 1424 he was taken prisoner by the English at Verneuil, but was released shortly afterwards, and fought with Joan of Arc at Orleans and Patay in 1429. The marshal had become a member of the grand council of Charles VII, and with the exception of a short disgrace about 1430, due to the ill-will of Georges de la Trémouille, he retained the royal favour all his life. He took an active part in the army reform initiated by Charles VII., and the establishment of military posts for the suppression of brigandage. His last campaign was against the English in Normandy in 1440. He died on the 23rd of February 1462. His line was continued by Gilbert IV, de La Fayette, son of his second marriage with Jeanne de Joyeuse.

**LA FAYETTE, LOUISE DE (c. 1516–1666)**, was one of the fourteen children of John, comte de La Fayette, and Marguerite de Bourbon-Busset. Louise became maid of honour to Anne of Austria, and Richelieu sought to attract the attention of Louis XIII. to her in the hope that she might counterbalance the influence exercised over him by Marie de Hautefort. The affair did not turn out as the minister wished. The king did in fact make her the confidante of his affairs and of his resentment against the cardinal, but she, far from repeating his confidences to the minister, set herself to encourage the king in his resistance to Richelieu's dominion. She refused, nevertheless, to become Louis's mistress, and after taking leave of the king in Anne of Austria's presence retired to the convent of the Filles de Sainte-Marie in 1637. Here she was repeatedly visited by Louis, with whom she maintained a correspondence. Richelieu intercepted the letters, and by omissions and falsifications succeeded in destroying their mutual confidence. The cessation of their intercourse was regretted by the queen, who had been educated with her daughter and through the influence of Louise. At the time of her death in January 1665 Mlle de La Fayette was superior of a convent of her order which she had founded at Chaillot. See *Mémoires de Madame de Montesquieu; Victor Cousin, Madame de Hautefort* (Paris, 1868); *L'Abbé Sorin, Louise-Andéole de La Fayette* (Paris, 1893).

**LA FAYETTE, MARIE JOSEPH PAUL YVES ROCH GILBERT DU MOTIER, MARQUIS DE (1757–1834)**, was born at the château of Chavaniac in Auvergne, France, on the 6th of September 1777. His father¹ was killed at Minden in 1759, and his mother and his grandfather died in 1770, and thus at the age of thirteen he was left an orphan with a princely fortune. He married at sixteen Marie Adrienne Françoise de Noailles (d. 1807), daughter of the duc d'Ayen and granddaughter of the duc de Noailles, then one of the most influential families in the kingdom. La Fayette chose to follow the career of his father, and entered the Guards. La Fayette was a captain of dragons when the English colonies in America proclaimed their independence. 

"At the first news of this quarrel," he afterwards wrote in his memoirs, "my heart was enrolled in it." The count de Broglie, whom he consulted, discouraged his zeal for the cause of liberty. Finding his purpose unpursueable, however, he presented the young enthusiast to Johann Kalb, who was also seeking service in America, and through Silas Deane, American agent in Paris, an arrangement was concluded, on the 7th of December 1776, by which La Fayette was to enter the American service as major-general. At this moment the news arrived of grave disasters to the American arms. La Fayette's friends again advised him to abandon his purpose. Even the American envoys, Franklin and Arthur Lee, who had superseded Deane, withheld further encouragement and the king himself forbade his leaving. At the instance of the British ambassador at Versailles orders were issued to seize the ship La Fayette was fitting out at Bordeaux, and La Fayette himself was arrested. But the ship was sent from Bordeaux to a neighbouring port in Spain, La Fayette escaped from custody in disguise, and before a second lettre de cachet could reach him he was aboard with eleven chosen companions. Though two British cruisers had been sent in pursuit of him, he landed safely near Georgetown, S.C., after a tedious voyage of nearly two months, and hastened to Philadelphia, then the seat of government of the colonies.

When this lad of nineteen, with the command of only what little English he had been able to pick up on his voyage, presented himself to Congress with Deane's authority to demand a commission of the highest rank after the commander-in-chief, his reception was a little chilly. Deane's contracts were so numerous, and for officers of such high rank, that it was impossible for Congress to ratify them without injustice to Americans who had become entitled by their service to promotion. La Fayette appreciated the situation as soon as it was explained to him, and immediately expressed his desire to serve in the American army upon two conditions—that he should receive no pay, and that he should act as a volunteer. These terms were so different from those made by other foreigners, they had been attended with such substantial sacrifices, and they promised such important indirect advantages, that Congress passed a resolution, on the 31st of July 1777, "that his services be accepted, and that, in consideration of his zeal, illustrious family and connexions, he have the rank and commission of major-general of the United States." Next day La Fayette met Washington, whose lifelong friend he became. Congress intended his appointment as purely honorary, and the question of giving him a command was left entirely to Washington's discretion. His first battle was Brandywine (q.v.) on the 11th of September 1777, where he showed courage and activity and received a wound. Shortly afterwards he secured what he most desired, the command of a division—the immediate result of a communication from Washington to Congress of November 1, 1777, in which he said:

"The only satisfaction of having a command equal to his rank. I do not know in what light Congress will view the matter, but it appears to me, from a consideration of his illustrious and important connexions, the attachment which he has manifested for our cause, and the consequences which his return in disgust might produce, that it will be advisable to gratify his wishes, and the more so as several gentlemen from France who came over under some assurances have gone back disappointed in their expectations. His conduct with respect to them stands in a favourable point of view—having interested himself to remove their uneasiness and urged the improbity of their making any unfavourable representations upon their arrival at home. Besides, he is the last man in his class who has exhibited any disinterestedness in our language, and from the disposition he discovered at the battle of Brandywine possesses a large share of bravery and military ardour." 

Of La Fayette's military career in the United States there is not much to be said. Though the commander of a division, he never had many troops in his charge, and whatever military talents he possessed were not of the kind which appeared to conspicuous advantage on the theatre to which his wealth and influential rank gave him a right to be called. In the first months of 1778 he commanded troops detailed for the projected expedition against Canada. His retreat from Barren Hill (May 28, 1778) was commended as masterly; and he fought at the battle of Monmouth (June 28), and received from Congress a formal recognition of his services in the Rhode Island expedition (August 1778).

The treaties of commerce and defensive alliance, signed by the insurgents and France on the 6th of February 1778, were promptly followed by a declaration of war by England against the latter, and La Fayette asked leave to revisit France and to consult his king as to the further direction of his services. This leave was readily granted; it was not difficult for Washington to replace the major-general, but it was impossible to find another equally competent, influential and devoted champion of the American cause near the court of Louis XVI. In fact, he went on a mission rather than a visit. He embarked on the 11th of January 1779, was received with enthusiasm, and was made a colonel in the French cavalry. On the 4th of March following Franklin wrote to the president of Congress: "The marquis de La Fayette... is infinitely esteemed and beloved here, and I am persuaded will

¹. The family of La Fayette, to the cadet branch of which he belonged, received its name from an estate in Aix, Auvergne, which belonged in the 13th century to the Motier family.

---

XVI. 3
do everything in his power to merit a continuance of the same affection from America.” He won the confidence of Vergennes.

La Fayette was absent from America about six months, and his return was the occasion of a complimentary resolution of Congress. From April until October 1781 he was charged with the defence of Virginia, in which Washington gave him the credit of doing all that was possible with the forces at his disposal; and he showed his zeal by borrowing money on his own account to provide his soldiers with necessaries. The battle of Yorktown, in which La Fayette bore an honourable if not a distinguished part, was the last of the war, and terminated his military career in the United States. He immediately obtained leave to return to France, where it was supposed he might be useful in negotiations for a general peace. He was also occupied in the preparations for a combined French and Spanish expedition against some of the British West India Islands, of which he had been appointed chief of staff, and a formidable fleet assembled at Cadiz, but the armistice signed on the 20th of January 1783 between the belligerents put a stop to the expedition. He had been promoted (1781) to the rank of maréchal de camp (major-general) in the French army, and he received every token of regard from his sovereign and his countrymen. He visited the United States again in 1784, and remained some five months as the guest of the nation.

La Fayette did not appear again prominently in public life until 1787, though he did good service to the French Protestants, and became actively interested in plans to abolish slavery. In 1787 he took his seat in the Assembly of Notables. He demanded, and he alone signed the demand, that the king convokve the states-general, thus becoming a leader in the French Revolution. He showed Liberal tendencies both in that assembly and after its dispersal, and in 1788 was deprived, in consequence, of his active command. In 1789 La Fayette was elected to the states-general, and took a prominent part in its proceedings. He was chosen vice-president of the National Assembly, and on the 11th of July 1789 presented a declaration of rights, modelled on Jefferson’s Declaration of Independence in 1776. On the 15th of July, the second day of the new régime, La Fayette was chosen by acclamation colonel-general of the new National Guard of Paris. He also proposed the combination of the colours of Paris, red and blue, and the royal white, into the famous tricolor cockade of modern France (July 17). For the succeeding three years, until the end of the constitutional monarchy in 1792, his history is largely the history of France. His life was beset with very great responsibility and peril, for he was ever the mind’s eye of such men as Robespierre and a frenzied people who had come to regard order and humanity as phases of treason. He rescued the queen from the hands of the populace on the 4th and 6th of October 1789, saved many humbler victims who had been condemned to death, and he risked his life in many unsuccessful attempts to rescue others. Before this, disgusted with enormities which he was powerless to prevent, he had resigned his commission; but so impossible was it to replace him that he was induced to resume it. In the Constituent Assembly he pleaded for the abolition of arbitrary imprisonment, for religious tolerance, for popular representation, for the establishment of trial by jury, for the gradual emancipation of slaves, for the freedom of the press, for the abolition of titles of nobility, and the suppression of privileged orders. In February 1790 he refused the supreme command of the National Guard of the kingdom. In May he founded the “Society of 1789” which afterwards became the Feuillants Club. He took a prominent part in the celebration of July 14, 1790, the first anniversary of the destruction of the Bastille. After suppressing an émeute in April 1791 he again resigned his commission, and was again compelled to retain it. He was the friend of liberty as well as of order, and when Louis XVI. fled to Varennes he issued orders to stop him. Shortly afterwards he was made lieutenant-general in the army. He commanded the troops in the suppression of another émeute, on the occasion of the proclamation of the constitution (September 18, 1791), after which, feeling that his task was done, he retired into private life. This did not prevent his friends from proposing him for the mayoralty of Paris in opposition to Pétion.

When, in December 1791, three armies were formed on the western frontier to attack Austria, La Fayette was placed in command of one of them. But events moved faster than La Fayette’s moderate and humane republicanism, and seeing that the lives of the king and queen were each day more and more in danger, he definitely opposed himself to the further advance of the Jacobin party, intending eventually to use his army for the restoration of a limited monarchy. On the 19th of August 1792 the Assembly declared him a traitor. He was compelled to take refuge in the neutral territory of Liège, whence as one of the prime movers in the Revolution he was taken and held as a prisoner of state for five years, first in Prussian and afterwards in Austrian prisons, in spite of the intercession of America and the pleadings of his wife. Napoleon, however, though he had a low opinion of his capacities, stipulated in the treaty of Campo Formio (1797) for La Fayette’s release. He was not allowed to return to France by the Directory. He returned in 1799; in 1802 voted against the life consulsate of Napoleon; and in 1804 he voted against the imperial title. He lived in retirement during the First Empire, but returned to public affairs under the First Restoration and took some part in the political events of the Hundred Days. From 1812 to 1824 he was deputy for the Sarthe, speaking and voting always on the Liberal side, and even becoming a carbonaro. He then revisited America (July 1824-September 1825) where he was overwhelmed with popular applause and voted the sum of $200,000 and a township of land. From 1825 to his death he sat in the Chamber of Deputies for Meaux. During the revolution of 1830 he again took command of the National Guard and pursued the same line of conduct, with equal want of success, as in the first revolution. In 1834 he made his last speech—on behalf of Polish political refugees. He died at Paris on the 20th of May 1834. In 1876 in the city of New York a monument was erected to him, and in 1883 another was erected at Puy.

Few men have owed more of their success and usefulness to their family rank than La Fayette, and still fewer have abused it less. He never achieved distinction in the field, and his political career proved him to be incapable of ruling a great national movement; but he had strong convictions which always impelled him to study the interests of humanity, and a pertinacity in maintaining them, which, in all the strange vicissitudes of his eventful life, secured him a very unusual measure of public respect. No citizen of a foreign country has ever had so great a hold on the sympathies of Americans, nor does any statesman in France appear to have ever possessed uninteruptedly for so many years so large a measure of popular influence and respect. He had what Jefferson called a “canine appetite” for popularity and fame, but in him the appetite only seemed to make him more anxious to merit the fame which he enjoyed. He was brave to rashness; and he never shrank from danger or responsibility if he saw the way open to spare life or suffering, to protect the defenceless, to sustain the law and preserve order.

His son, Georges Washington Motier de La Fayette (1779-1834), entered the army and was aide-de-camp to General Grouchy through the Austrian, Prussian and Polish (1805-07) campaigns. Napoleon’s distrust of his father rendering promotion improbable, Georges de La Fayette retired into private life in 1807 until the Restoration, when he entered the Chamber of Representatives and voted consistently on the Liberal side. He was away from Paris during the revolution of July 1830, but he took an active part in the “campaign of the banquet,” which led up to that of 1848. He died in December of the next year. His son, Oscar Thomas Gilbert Motier de La Fayette (1815-1881), was educated at the École Polytechnique, and served as an artillery officer in Algeria. He entered the Chamber of Representatives in 1846 and voted, like his father, with the extreme Left. After the revolution of 1848 he received a post in the provisional government, and as a member of the Constituent Assembly he became secretary of the war committee. After the dissolution of the Legislative Assembly in 1851, he retired from public life, but emerged on the establishment of
the third republic, becoming a life senator in 1875. His brother Edmond Motier de La Fayette (1818–1890) shared his political opinions. He was one of the secretaries of the Constituent Assembly, and a member of the senate from 1876 to 1888.

LA FAYETTE, MARIE-MADELEINE PICHE DE LA VERGNE, COMTESSE DE (1634–1662), French novelist, was baptized in Paris on the 18th of March 1634. Her father, Marc Pioche de la vergne, commandant of Havre, died when she was sixteen, and her mother seems to have been more occupied with her own than her daughter’s education. The vergne family was comparatively wealthy, and Marie's brother was connected with Mme de Sévigné, who was destined to be a lifelong friend. She studied Greek, Latin, and Italian, and inspired in one of her tutors, Gilles de Ménage, an enthusiastic admiration which he expressed in verse in three or four languages. Marie married in 1655 François Motier, comte de La Fayette. They lived on the count's estates in Auvergne, according to her own account (in a letter to Ménage) quite happily; but after the birth of her two sons her husband disappeared so effectually that it was long supposed that he died about 1660, though he really lived until 1683. Mme de La Fayette had returned to Paris, and about 1665 contracted an intimacy with the duc de la Rochefoucauld, then engaged on his Maximes. The constancy and affection that marked this liaison on both sides justified it in the eyes of society, and when in 1680 La Rochefoucauld died Mme de La Fayette received the sincerest sympathy.

Her first novel, La Princesse de Montpensier, was published about 1671; R. Sarrin, La Fayette et la Révolution de 1830, his name of J. R. de Segrais; and in 1678 his masterpiece, La Princesse de Clèves, also under the name of Segrais. The history of the modern novel of sentiment begins with the Princesse de Clèves. The interminable pages of Mlle de Scudéry with the Precieuses and their admirers masquerading as Persians or ancient Romans had already been discredited by the burlesques of Paul Scarron and Antoine Furetière. It remained for Mme de La Fayette to achieve the more difficult task of substituting something more satisfactory than the disconnected episodes of the roman comique. This she accomplished in a story offering in its shortness and simplicity a complete contrast to the extravagant and lengthy romances of the time. The interest of the story depends not on incident but on the characters of the personages. They act in a perfectly reasonable way and their motives are analysed with the finest discrimination. No doubt the semi-autobiographical character of the material partially explains Mme de La Fayette's refusal; a contemporary critic, Mme de Sévigné amongst them, found fault with the avowal made by Mme de Clèves to her husband.

In answer to these criticisms, which her anonymity prevented her from answering directly, Mme de La Fayette wrote her last novel, the Comtesse de Tendre.

The character of her work and her history have combined to give an impression of melancholy and sweetness that only represents one side of her character, for a correspondence brought to light comparatively recently showed her as the acute diplomatic agent of Jeanne de Nemours, Duchess of Savoy, under whose immediate direction she wrote her Histoire de Madame Henriette d'Angleterre, which only appeared in 1720. She wrote memoirs of the reign of Louis XIV., which, with the exception of two chapters, for the years 1688 and 1689 (published at Amsterdam, 1731, were lost through her son's carelessness. Madame de La Fayette died on the 25th of May 1692.

See Sainte-Beuve, Portraits de femmes: the comte d'Haussonville, Madame de La Fayette (1891), in the series of Grands écrivains français; M. de Lesure's notice preceded an edition of the Princesse de Clèves (1881); and a critical edition of the historical memoirs by Eugène Asse (1890). See also L. Rea, Marie Madeleine, comtesse de La Fayette (1898).

LAFAYETTE, a city and the county-seat of Tippecanoe county, Indiana, U.S.A., situated at the former head of naviga-

the Wabash river, about 64 m. N.W. of Indianapolis. Pop. (1900) 18,116, of whom 2266 were foreign-born: (1910 census) 20,851. It is served by the Chicago, Indianapolis & Louisville, the Cleveland, Cincinnati, Chicago & St Louis, the Lake Erie & Western, and the Wabash railways, and by the Terre Haute, Indianapolis & Eastern (electric), and the Fort Wayne & Wabash Valley (electric) railways. The river is not now navigable at this point. Lafayette is in the valley of the Wabash river, which is sunk below the normal level of the plain, the surrounding heights being the walls of the Wabash basin. In 1769 an Indian village, the Wabash, was destroyed by a general massacre of 377 men, women, and children.

The city lies in the heart of a rich agricultural region, and is an important market for grain, produce and horses. Among its manufactures are beer, foundry and machine shop products (the Chicago, Indianapolis & Louisville railway has a foundry at Lafayette), flour and other foods, meat and meat products, chilled meats, canned goods, flour and carpets; the value of the factory product increased from $3,514,270 in 1900 to $4,631,415 in 1905, or 31.8 per cent. The municipality owns its water works.

Lafayette is about 5 m. N.E. of the site of the ancient Wea (Miami) Indian village known as Ouatanon, where the French established a post about 1720. The French garrison gave way to the English about 1760; the stockade fort was destroyed during the conspiracy of Pontiac, and was never rebuilt. The head-quarters of Tecumseh and his brother, the "Prophet," were established 7 m. N. of Lafayette near the mouth of the Tippecanoe river, and the settlement there was known as the "Prophet's Town." Near this place, and near the site of the present village of Battle Ground (where the Indiana Methodists now have a summer encampment and a camp meeting in August), was fought on the 7th of November 1811 the battle of Tippecanoe, in which the Indians were decisively defeated by Governor William Henry Harrison, the whites losing 188 in killed and wounded and the Indians about an equal number. The battle ground is owned by the state; in 1907 the state legislature and the United States Congress each appropriated $12,500 for a monument, which took the form of a granite shaft 50 ft. high. The first American settlers on the site of Lafayette appeared about 1820, and the town was laid out in 1825, but for many years its growth was slow. The completion of the Wabash and Erie canal marked a new era in its development, and in 1854 Lafayette was incorporated.

LA FERTÉ, the name of a number of localities in France, differentiated by agnomes. La Ferté Imbault (department of Loir-et-Cher) was in the possession of Jacques d'Étampes (1390-1668), marshal of France and ambassador in England.
who was known as the marquis of La Ferté Imbault. La Ferté Nabet (the modern La Ferté Saint Aubin, department of Loiret) was acquired in the 16th century by the house of Saint Nectaire (corrupted to Senneterre), and erected into a duchy in the peerage of France (duché-pairie) in 1665 for Henri de Saint Nectaire, marshal of France. It was called La Ferté Lowendal after the Lowendal (Jermeti) statue of Louis XVI, which was erected in the Flamboyant Gothic style. The town hall occupies the superstructure and flanking towers of a fortified gateway of the 15th century.

La Ferté-Bernard owes its origin and name to a stronghold (fermelé) built about the 11th century and afterwards held by the family of Bernard. In 1424 it did not succumb to the English troops till after a four months' siege. It belonged in the 16th century to the family of Guise and supported the League, but was captured by the French on 24th January 1590.

LA FERTÉ-MILON, a town of northern France in the department of Aisne on the Ourcq, 47 m. W. by S. of Reims by rail. Pop. (1906) 1,563. The town has imposing remains comprising one side flanked by four towers of an unfinished castle built about the beginning of the 15th century by Louis of Orleans, brother of Charles VI. The churches of St Nicholas and Notre-Dame, chiefly of the 16th century, both contain fine old stained glass. Jean Racine, the poet, was born in the town, and a statue by David d'Angers has been erected to him.

Laffitte, Jacques (1767–1844), French banker and politician, was born at Bayonne on the 24th of October 1767, one of the ten children of a carpenter. He became clerk in the banking house of Perregaux in Paris, was made a partner in the business in 1800, and in 1804 succeeded Perregaux as head of the firm. The house of Perregaux, Laffitte et Cie., became one of the greatest in Europe, and Laffitte became regent (1809), then governor (1814) of the Bank of France and president of the Chamber of Commerce (1814). He raised large sums of money for the provisional government in 1814 and for Louis XVIII. during the Hundred Days, and it was with him that Napoleon deposited five million francs in gold before leaving France for the last time. Rather than permit the government to appropriate the money from the Bank he supplied two million from his own pocket for the arrears of the imperial troops after Waterloo. He was returned by the department of the Seine to the Chamber of Deputies in 1816, and took his seat on the Left. He spoke chiefly on financial questions; his known Liberal views did not prevent Louis XVIII. from insisting on his inclusion on the commission on the public finances. In 1818 he saved Paris from a financial crisis by buying a large amount of stock, but next year, in consequence of his heated defence of the liberty of the press and the electoral law of 1827, the government of the Bank was taken from him. One of the earliest and most determined of the partisans of a constitutional monarchy under the duke of Orleans, he was deputy for Bayonne in July 1830, when his house in Paris became the headquarters of the revolutionary party. When Charles X., after retracting the hated ordinances, sent the comte d'Argout1 to Laffitte to negotiate a change of ministry, the banker replied, "It is too late. There is no longer a Charles X.," and it was he who secured the nomination of Louis Philippe as lieutenant-general of the kingdom. On the 3rd of August he became president of the Chamber of Deputies, and on the 9th he received in this capacity Louis Philippe's oath to the new constitution. The clamour of the Paris mob for the death of the imprisoned ministers of Charles X., which in October culminated in riots, induced the more moderate members of the government—including Guizot, the duc de Broglie and Casimir-Périer—to hand over the administration to a ministry which, possessing the confidence of the revolutionary Parisians, should be in a better position to save the ministers from their fury. On the 5th of November, accordingly, Laffitte became minister-president of a government pledged to progress (reconstruction), holding at the same time the portfolio of finance. The government was torn between the necessity for preserving order and the no less pressing necessity (for the moment) of conciliating the Parisian populace; with the result that it succeeded in doing neither one nor the other. The impeached ministers were, indeed, saved by the courage of the Chamber of Peers and the attitude of the National Guard; but their safety was bought at the price of Laffitte's popularity. His policy of a French intervention in favour of the Italian revolutionists, by which he might have regained his popularity, was thwarted by the diplomatic policy of Louis Philippe. The resignation of Lafayette and Dupont de l'Eure still further undermined the government, which, incapable even of keeping order in the streets of Paris, ended by being discredited with all parties. At length Louis Philippe, anxious to free himself from the hammering control of the agents of his own state, thought it safe to surrender his confidence in the man who had made him king. Thereupon, in March 1831, Laffitte resigned, begging pardon of God and man for the part he had played in raising Louis Philippe to the throne. He left office politically and financially a ruined man. His affairs were wound up in 1836, and next year he created a credit bank, which prospered as long as he lived, but failed in 1848. He died in Paris on the 26th of May 1844.

See P. Thureau-Dangin, La Monarchie de Juillet (vol. i. 1884).

Laffitte, Pierre (1823–1903), French Positivist, was born on the 21st of February 1823 at Béguey (Gironde). Residing at Paris as a teacher of mathematics, he became a disciple of Comte, who appointed him his literary executor. On the schism of the Positivist body which followed Comte's death, he was recognized as head of the section which accepted the full Comtian doctrine; the other section adhering to Littre, who rejected the religion of humanity as inconsistent with the materialism of Comte's earlier period. From 1853 Laffitte delivered Positivist lectures in the room formerly occupied by Comte in the rue Monsieur le Prince. He published Les Grands Types de l'humanité (1873) and Cours de philosophie première (1888). In 1893 he was appointed to the new chair founded at the Collège de France for the exposition of the general history of science, and it was largely due to his inspiration that a statute to Comte was erected in the Place de la Sorbonne in 1902. He died on the 4th of January 1903.

La Flèche, a town of western France, capital of an arrondissement in the department of Sarthe on the Loire, 31 m. S.S.W. of Le Mans by rail. Pop. (1906) 7,800; commune 10,663. The chief interest of the town lies in the Prayеннée, a famous school for the sons of officers, originally a college founded for the Jesuits in 1607 by Henry IV. The buildings, including a fine chapel, were erected from 1620 to 1653 and are surrounded by a park. A bronze statue of Henry IV. stands in the marketplace. La Flèche is the seat of a sub-prefecture and of a tribunal of first instance, and carries on tanning, flour-milling, and the manufacture of paper, starch, wooden shoes and gloves. It is an agricultural market.

The lords of La Flèche became counts of Maine about 1100, but the lordship became separate from the county and passed in the 16th century to the family of Bourbon and thus to Henry IV.

La Font, Pierre Chéri (1707–1873), French actor, was born at Bordeaux on the 13th of May 1797. Abandoning his profession as assistant ship's doctor in the navy, he went to Paris to study singing and acting. He had some experience at the small theatre, and was preparing to appear at the Opéra Comique when the director of the Vaudeville offered him an engagement. Here he made his début in 1821 in La Sonnambule, and his good looks and excellent voice soon brought him into

---

1 Apollinaire Antoine Maurice, comte d'Argout (1782–1858), afterwards reconciled to the July monarchy, and a member of the Laffitte, Casimir-Périer and Thiers cabinets.
LA FONTAINE, Jean de (1621-1695), French poet, was born at Château Thierry in Champagne, probably on the 8th of July 1621. His father was Charles de La Fontaine, "maître des eaux et forêts"—a kind of deputy-ranger—of the duchy of Château Thierry; his mother was Françoise Picoux. On both sides his family was of the highest provincial middle class, but was not noble; his father was also fairly wealthy. Jean, the eldest child, was educated at the collège (grammar-school) of Reims, and at the end of his school days he entered the Oratory in May 1641, and the seminary of Saint-Magloire in the same year; but a very short sojourn proved to him that he had mistaken his vocation. He then apparently studied law, and is said to have been admitted as avocat, though there does not seem to be actual proof of this. He was, however, settled in life, or at least might have been so, somewhat early. In 1647 his father resigned his rangership in his favour, and arranged a marriage for him with Marie Héricart, a girl of sixteen, who brought him twenty thousand livres, and expectations. She seems to have been both handsome and intelligent, but the two did not get on well together. There appears to be absolutely no ground for the vague scandal as to her conduct, which was, for the most part long afterwards, raised by gossips or personal enemies of La Fontaine. All that is positively said against her is that she was a negligent housewife and an inveterate novel reader; La Fontaine himself was constantly away from home, was certainly not strict in point of conjugal fidelity, and was so bad a man of business that his affairs became involved in hopeless difficulty, and a separation de biens had to take place in 1658. This was a perfectly amicable transaction for the moment, but the family were far from happy; there was no actual quarrel, ceased to live together, and for the greater part of the last forty years of La Fontaine's life he lived in Paris while his wife dwelt at Château Thierry, which, however, he frequently visited. One son was born to them in 1653, and was educated and taken care of wholly by his mother.

Even in the earlier years of his marriage La Fontaine seems to have been much at Paris, but it was not till about 1656 that he became a regular visitor to the capital. The duties of his office, which were only occasional, were compatible with this non-residence. It was not till he was past thirty that his literary career began. The reading of Malherbe, it is said, first awoke poetical fancies in him, but for some time he attempted nothing but trifles in the fashion of the time—epigrams, ballades, rondels, &c. His first serious work was a translation or adaptation of the Ennuichus of Terence (1654). At this time the Maecenases of French letters was the Superintendent Fouquet, to whom La Fontaine was introduced by Jacques Jannart, a connexion of his wife's. Few people who paid their court to Fouquet went away empty-handed, and La Fontaine soon received a pension of 1000 livres (1659), on the easy terms of a copy of verses for each quarter's receipt. He began too a medley of prose and poetry, entitled Le Songe de Vaux, on Fouquet's famous country house. It was about this time that his wife's property had to be separately secured to her, and he seems by degrees to have had to sell everything of his own; but, as he never lacked powerful and generous patrons, this was of small importance to him. In the same year he wrote a ballad, Les Rieurs du Beau-Richard, and this was followed by many small pieces of occasional poetry addressed to various personages from the king downwards. Fouquet soon incurred the royal displeasure, but La Fontaine, like most of his literary protégés, was not unfaithful to him, the well-known elegy Pleurez, nymphes de Vaux, being by no means the only proof of his devotion. Indeed it is thought not improbable that a journey to Limoges in 1658 in company with Jannart, and of which we have an account written to his wife, was not wholly spontaneous, as it certainly was not on Jannart's part. Just at this time his affairs did not look promising. His father and himself had assumed the title of esquire, to which they were not strictly entitled, and, some old edicts on the subject having been put in force, an informer procured a sentence against the poet fining him 2000 livres. He found, however, a new protector in the duke and still more in the duchess of Bouillon, his feudal superiors at Château Thierry, and nothing more is heard of the fine. Some of La Fontaine's liveliest verses are addressed to the duchess, Anne Mancini, the youngest of Mazarin's nieces, and it is even probable that the taste of the duke and duchess for Ariosto had something to do with the writing of his first work of real importance, the first book of the Contes, which appeared in 1664. He was then forty-three years old, and his previous printed productions had been comparatively trivial, though much of his work was handed about in manuscript long before it was regularly published. It was about the time that the quartette La Fâcheuse, or Columbier, so famous in French literary history, was formed. It consisted of La Fontaine, Racine, Boileau and Molière, the last of whom was almost of the same age as La Fontaine, the other two considerably younger. Chapelle was also a kind of outsider in the coterie. There are many anecdotes, some pretty obviously apocryphal, about these meetings. The most characteristic is perhaps that which asserts that a copy of Chapelle's unlucky Pleurez always lay on the table, a certain number of lines of which was the appointed punishment for offences against the company. The coterie furnished under feigned names the personages of La Fontaine's version of the Cupid and Psyche story, which, however, with Adonis, was not printed till 1669. Meanwhile the poet continued to find friends. In 1664 he was regularly commissioned and sworn in as gentleman to the duchess dowager of Orléans, and was installed in the Luxembourg. He still retained his rangership, and in 1666 we have something like a reprint from Colbert suggesting that he should look into some malpractices at Château Thierry. In the same year he published volume 1 of Contes, and in 1671 the first six books of the Fables, with more of both kinds in 1671. In this latter year a curious instance of the docility with which the poet lent himself to any influence was afforded by his officiating, at the instance of the Port-Royalists, as editor of a volume of sacred poetry dedicated to the prince de Conti. A year afterwards his situation, which had for some time been decidedly flourishing, showed signs of changing very much for the worse. The duchess of Orléans died, and he apparently had to give up his rangership, probably selling it to pay debts. But there was always a providence for La Fontaine. Madame de la Sablière, a woman of great beauty, of considerable intellectual power and of high character, invited him to make his home in her house, where he lived for some twenty years. He seems to have had no trouble whatever about his affairs thenceforward; and could devote himself to his two different lines of poetry, as well as to that of theatrical composition.

In 1692 he was, at more than sixty years of age, recognized as one of the first men of letters of France. Madame de Sévigné, one of the soundest literary critics of the time, and by no means given to praise mere novelties, had spoken of his second collection of Fables published in the winter of 1678 as divine; and it is pretty certain that this was the general opinion. It was not unreasonable, therefore, that he should present himself to the Academy, and, though the subjects of his Contes were scarcely calculated to propagate that decorous assembly, while his attachment to Fouquet and to more than one representative of the old Frontonde party made him suspect to Colbert and the king, most of the members were his personal friends. He was first proposed in 1682, but was rejected for Dangeau. The next year Colbert died and La Fontaine was again nominated. Boileau was also a candidate, but the first ballot gave the fabulist
sixteen votes against seven only for the critic. The king, whose assent was necessary, not merely for election but for a second ballot in case of the failure of an absolute majority, was ill-pleased, and the election was left pending. Another vacancy occurred, however, some months later, and to this Boileau was elected. The king hastened to approve the choice effusively, adding, "Vous pouvez incessamment recevoir La Fontaine, il a promis d'être sage." His admission was indirectly the cause of the only serious literary quarrel of his life. A dispute took place between the Academy and one of its members, Antoine Furetière, on the subject of the latter's French dictionary, which was decided to be a breach of the Academy's corporate privileges. Furetière, a man of no small ability, bitterly assailed those whom he considered to be his enemies, and among them La Fontaine, whose unlucky Contes made him particularly vulnerable, his second collection of these tales having been the subject of a police condemnation. The death of the author of the Roman Bourgeois, however, put an end to this quarrel. Shortly afterwards La Fontaine had a share in a still more famous affair, the celebrated Ancient-and-Modern squabble in which Boileau and Perrault were the chiefs, and in which La Fontaine (though he had been specially singled out by Perrault for favourable comparison with Aesop and Phaedrus) took the Ancient side. About the same time (1685–1687) he made the acquaintance of the last of his many hosts and protectors, Monsieur and Madame d'Hervart, and fell in love with a certain Madame Ulrich, a lady of some position but of doubtful character. This acquaintance was accompanied by a great familiarity with Vendôme, Chaufeu and the rest of the libertine coterie of the Temple; but, though Madame de la Sablière had long given herself up almost entirely to good works and religious exercises, La Fontaine continued an inmate of her house until her death in 1693. What followed is told in one of the best known of the many stories bearing on his childlike nature. Hervart, on hearing of the death, had set out at once to find La Fontaine. He met him in the street in great sorrow, and begged him to make his home at his house. "J'y allais" was La Fontaine's answer. He had already undergone the process of conversion during a severe illness the year before. An energetic young priest, M. Poucet, had brought him, not indeed to understand, but to acknowledge the impropriety of the Contes, and it is said that the destruction of a new play of some merit was demanded and submitted to as a proof of repentance. A pleasant story is told of the young duke of Burgundy, Fénélon's pupil, who was then only eleven years old, sending 50 louis to La Fontaine as a present of his own motion. But, though La Fontaine recovered for the time, he was broken by age and infirmity, and his new hosts had to nurse rather than to entertain him, which they did very carefully and kindly. He did a little more work, completing his Fables among other things; but he did not survive Madame de la Sablière much more than two years, dying on the 13th of April 1695, at the age of seventy-three. He was buried in the cemetery of the Holy Innocents. His wife survived him eighteen years longer.

The curious personal character of La Fontaine, like that of some other men of letters, has been enshrined in a kind of legend by literary tradition. At an early age his absence of mind and indifference to business gave a subject to Tallemant des Réaux. His later contemporaries helped to swell the tale, and the 18th century finally accepted it, including the anecdotes of his meeting his son, being told who he was, and remarking, "Ah, yes, I thought I had seen him somewhere!" of his insisting on fighting as a duel with a supposed admirer of his wife, and then imploring him to visit at his house just as before; of his going into company with his stockings wrong side out, &c., with, for a contrast, those of his awkwardness and silence, if not positive rudeness, in company. It ought to be remembered, as a comment on the unfavourable description by La Bruyère, that La Fontaine was a special friend and ally of Benserade, La Bruyère's chief literary enemy. But after all deductions much will remain, especially when it is remembered that one of the chief authorities for these anecdotes is Louis Racine, a man who possessed intelligence and moral worth, and who received them from his father, La Fontaine's attached friend for more than thirty years. Perhaps the best worth recording of all these stories is one of the Vielle Coulombier quartette, which tells how Molière, while Racine and Boileau were exercising their wits upon "le bonhomme" or "le bon" (by both which titles La Fontaine was familiarly known), remarked to a bystander, "Nos beaux esprits ont beau faire, ils n'effacerront pas le bonhomme." They have not.

The works of La Fontaine, the total bulk of which is considerable, fall no less naturally than traditionally into three divisions, the Fables, the Contes and a variety of other works. The Fables, which may be said to be known universally, the second to be known to all lovers of French literature, the third to be with a few exceptions practically forgotten. This distribution of the judgment of postery is not entirely just, not even though these different things in the Œuvres Diverses, but their excellence is only occasional, and it is not at the best equal to that of the Fables or the Contes. It was thought by contemporary judges who were both competent and friendly to La Fontaine that if any one of his works, except perhaps something in the criticism. His dramatic efforts are especially weak. The best pieces usually published under his name—Ragot, Le Fioretin, Le Coupe enchantée, were originally fathered not by La Fontaine, but by one of his most devoted admirers who, in the meanness of his own talent, was not given to understand the worth of any other than his own—La Fontaine's jealousy of Racine and Charles de Sévigné. His avowed work was chiefly in the form of opera, a form of no great value at its best. Psyche has all the advantages of its charming story and of La Fontaine's taste, style, and invention, and the music, by the way, because of the framework of personal conversation already alluded to. The mingled prose and verse of the Songe de Vasco is not unintestible, but its best things, such as the description of night—

"Laissant tomber le fleurs et le ses emprumant,
Which has enchanted French critics, are little more than conceits, though as in this case sometimes very beautiful conceits. The elegies, the epistles, the epigrams, the ballades, contain many things the student of every man who has ever written a line of verse de la société, but even if they be taken according to the wise rule of modern criticism, each in its kind, and judged simply according to their rank in that kind, they fall far below the merit of the best collections of Fables or of Contes. In this, as in a hundred other points, La Fontaine was paralleled by his contemporaries. Between the actual literary merits of the two there is not much to choose, but the change of manners and the altered standard of literary decency have thrown the Contes into the shade. These tales have been brought down in a way which is as difficult to explain as it is easy to comprehend. These Contes, which contain the best part of the moralising of the Fables, may perhaps now be an object of interest to the modern student, who beholds in them so marvellous a faculty of saying more or less outrageous things in the most polite and gentlemanly manner. These Contes have indeed certain drawbacks. They are not penetrated by the half pagan sense of physical beauty and the delights of sense which animate and excurses the early Italian Renaissance. They have not the subtle mixture of passion and sensuality, of poetry and appetite, which distinguishes the work of Marmontel and of the Pléiade. They are not, as a whole, a commentary, as are the Fables, on the life of Voltaire, as a confection of the best gallois of the fabliau writers and of Rabelais, deuctose of the grossness of envelope which had formerly covered that spirit. A comparison of La Fontaine of the du roi de Garbe's, as well as of the first saucy essay as a commentary) will illustrate better than anything else what they have and what they have not. Some writers have pleaded hard for the admission of actual passion of the poetical sort in the Fables, of which there are few instances, as "Amour amoureux," but as a whole must be admitted to be absent.

The Fables, with hardly less animation and narrative art than the Contes, are free from disadvantages (according to modern notions) of moralising, and exhibit, in the treatment of what may be called the author's talent perhaps even more fully. La Fontaine had many predecessors in the fabe and especially in the beast fabe. In his first issue, comprising what are now called the first six books, he adhered to the path of these predecessors with some closeness; but in the later collections he allowed himself far more liberty, and it is in these parts that his genius is most fully manifested. The boldness of the politics is as much to be considered as the ingenuity of the moralising, as the intimate knowledge of human nature displayed in the substance of
the narratives, or as the artistic mastery shown in their form. It has sometimes been objected that the view of human character which La Fontaine expresses is unduly dark, and resembles too much that of La Rochefoucauld, for whom the poet had a profound admiration. However, as Coleridge observes, "La Fontaine did not copy.

It may only be said that satire (and La Fontaine is eminently a satirist) necessarily concerns itself with the darker rather than with the lighter shades. Indeed the objection has become pretty nearly obsolete since the work of Lessing. Lamartine has found for himself, in the Home of Telemaque, a theme that has been found for him in no other. Its ambiguity, its part in the sequence, things: of country; perhaps were of the classics, Fables, pamphlets and any class of effect. La Fontaine's Fables is that of Silvestre de Sacy, to the effect that they supply three several delights to three several ages: the child rejoices in the freshness and vivacity of the story, the young man in the moral and virtue of the art with which it is told, the experienced man of the world in the subtle reflections on character and life which it conveys. Nor has any one, with the exception of a few paradoxes like Rousseau and a few sentimentalists like Lamartine, denied that the moral tone of the whole is as fresh and healthy as its literary interest is vivid. The book has therefore naturally become the standard reading book of French both at home and abroad, a position which it shares in verse with the Télemaque de Pérouse in prose. It is no small testimony to its merit that not even this use or misuse has interfered with its popularity.

The general literary character of La Fontaine is, with allowance made for the difference of subject, visible equally in the Fables and in the Poémes. But the difference of the harbours in which he was born for an English student is the dictum of Joubert to the effect that "Il y a dans La Fontaine une plénitude de poésie qu'on ne trouve nulle part dans les autres auteurs français." The difficulty arises from the appearance of the art, for it is easy to observe a number of striking similarities in the observation of the rules of art La Fontaine observes, if not the first, at least the first three among French poets. In his hands the oldest story becomes novel, the most hackneyed moral pliant, the most conventional, as the master of the art, and applied to the art, there has not been such unanimous agreement. It was used to be considered that La Fontaine's ceaseless diversity of metre, his archaisms, his licences in rhyme and orthography, were merely ingenious devices for the purpose of audacity and novelty, the triumphs of the most accurate metrical critic and one of the most skillful metrical practitioners that France has ever had, Théodore de Banville; and it is only surprising that it should ever have been entertained by any poet, even by La Fontaine himself, by the use, that is to say, the regulated, his cadences carefully arranged, and the whole effect may be said to be (though, of course, in a light and tripping measure instead of a stately one) similar to that of the stanzas of the English pindaric ode. As Joubert says of La Fontaine, "S'il n'est rien de plus contraire à La Fontaine sur le score de invention et de mémoire sur le score de art. But something more, at least according to English standards, is wanted to make up a "plénitude of poetry", and this something more is the verse itself. The theory of the use, for example of the words of Joubert himself elsewhere, he never "transports!" The faculty of transporting is possessed and used in very different manners by different poets. In some it takes the form of passion, in some of his own particular, its peculiarism, its brooding, its melancholy, its eloquence, in some of moral fervour. La Fontaine has none of these things: he is always amusing, always sensible, always clever, sometimes even affecting, but at the same time more always more or less prosaic, were it not for his admirable observations. La Fontaine might be perhaps not even a great humorist; but he is the most admirable teller of light tales in verse that has ever existed in any time or country; and he has established in his verse-tale a model which is never to be excelled.

La Fontaine did not during his life issue any complete edition of his works, nor even of the two greatest and most popular collections of his works. The most remarkable of his separate publications have been the second, third, and fourth volumes of Le Drame de la Rose (1675), one of the pieces inspired by the Port-Royalists, the Poème du Quinquin (1695), a piece of task work also, though of a very different kind, and a number of pieces published either in small pamphlets, of which copies of some of the latter may be still in the same books the works of his friend Maurois (1685). The year after his death some homonymous works appeared, and some years after his son's death (1700) the unemblemized and unembodied work which he had written were published by the family in manuscript, were corrected, and published as OEuvres diverses (1729). During the 18th century the two of the most magnificent illustrated editions ever published of any of the works of La Fontaine, the two volumes of the Fables were illustrated by Oudry (1755-1756), the Contes by Etienne (1762). This latter under the title of "Édition des Fiers-Merisiers Généraux" fetches a high price. During the first thirty years of the 19th century Wackenroder, a great student of French 17th-century classics, published for the house of Diderot three successive editions of La Fontaine, the last (1826-1827) being perhaps entitled to the rank of the standard edition, as his Histoire de la vie et des ouvrages de La Fontaine is the standard biography and bibliography. The later editions of M. Marty-Laveaux in the Bibliothèque éclairée, A. A. de Lamartine, and L. M. de Lamartine have done much for the study of the poet, and if an illustrated edition published by the Librairie des Bibliophiles (1874) deserves to be mentioned as not unworthy of its 18th-century predecessors. The works of M. Grouchy, Documents intérieurs sur la vie de La Fontaine (1863); of G. Lafenestre, Jean de La Fontaine (1905), and of Émile Faguet, Jean de La Fontaine (1900), should be mentioned.

LAFONTAINE, SIR LOUIS HIPPOLYTE, BART. (1807-1864), Canadian statesman and judge, third son of Antoine Ménard LaFontaine (1777-1813) and Marie-Jeanne Fontaine, was born at Boucherville in the province of Quebec on the 4th of October 1807. LaFontaine was educated at the Collège de Montréal under the direction of the Sulpicians, and was called to the bar of the province of Lower Canada on the 18th of August 1830. He married firstly Adèle, daughter of A. Bertheloit of Quebec; and, secondly, Janette, daughter of Charles Morison, of Berthier, by whom he had two sons. In 1836 he was elected a member of the House of Assembly for the county of Terrebonne, and became an ardent supporter of Louis Joseph Papineau in opposing the administration of the governor-in-chief, which led to the rebellion of 1837. LaFontaine, however, did not approve the violent methods of his leader, and after the hostilities at Saint Denis he presented a petition to Lord Gosford requesting him to summon the assembly and to adopt measures to stem the revolutionary course of events in Lower Canada. The rebellion broke out afresh in the autumn of 1838; the constitution of 1837 was suspended; LaFontaine was imprisoned for a brief period, and Papineau, who favoured annexation by the United States, was in exile. At this crisis in Lower Canada the French Canadians turned to LaFontaine as their leader, and under his direction maintained their opposition to the union of the two Canadian councils, composed of nominees of the crown. In 1839 Lord Sydenham, the governor-general, offered the solicitor generalship to LaFontaine, which he refused; and after the Union of 1841 LaFontaine was defeated in the county of Terrebonne through the governor's influence. During the next year he obtained a seat in the assembly of the province of Canada, and on the death of Sydenham he was called by Sir Charles Bagot to form an administration with Robert Baldwin. The ministry resigned in November 1843, as a protest against the actions of Lord Metcalfe, who had succeeded Bagot. In 1848 LaFontaine formed a new administration with Baldwin, and remained in office until 1851, when he retired from public life. It was during the ministry of LaFontaine-Baldwin that the Amnesty Bill was passed, which occasioned grave riots in Montreal, personal violence to Lord Elgin, and the destruction of the parliament buildings. After the death of Sir James Stuart in 1853 LaFontaine was appointed chief justice of Lower Canada and president of the seigneurial court, which settled the vexed question of land tenure in Canada; and in 1854 he was created a baronet. He died at Montreal on the 26th of February 1864.

LaFontaine was well versed in constitutional history and French law; he reasoned closely and presented his conclusions with directness. He was upright in his conduct, sincerely attached to the traditions of his race, and laboured conscientiously to establish responsible government in Canada. He was the author of the 'Reglement du conseil spécial sur les baux d'hypothèques' (Montreal, 1842); Observations on the questions seigneuriales (Montreal, 1854); see La Fontaine, by A. DeCelles (Toronto, 1906).

B. (A. G. D.)

LOFOSSE, CHARLES DE (1640-1716), French painter, was born in Paris. He was one of the most noted and least servile pupils of Le Brun, under whose direction he shared in the chief of the great decorative works undertaken in the reign of Louis XIV. Leaving France in 1662, he spent two years in Rome and three in Venice, and the influence of his prolonged studies of Veronese is evident in his "Finding of Moses" (Louvre), and in his "Rape of Proserpine" (Louvre), which he presented to the Royal Academy as his diploma picture in 1673.
at once named assistant professor, and in 1874, the full responsibilities of the office devolved on him, but his engagements did not prevent his accepting in 1889 the invitation of Lord Montagu to decorate Montagu House. He visited London twice, remaining on the second occasion—together with Rousseau and Monnoyer—more than two years. William III. vainly strove to detain him in England by the proposal that he should decorate Hampton Court, for Le Brun was dead, and Mansart pressed Lacroix to return to Paris to take in hand the cupula of the Invalides. The decorations of Montagu House are destroyed, those of Versailles are restored, and the dome of the Invalides (engraved, Picart and Cochin) is now the only work existing which gives a full measure of his talent. During his latter years Lacroix executed many other important decorations in public buildings and private houses, notably in that of Crozat, under whose roof he died on the 23rd of December 1776.

LAGARDE, PAUL ANTON DE (1827-1891), German biblical scholar and orientalist, was born at Berlin on the 2nd of November 1827. His real name was Bötticher, Lagarde being his mother's name. At Berlin (1844-1846) and Halle (1846-1847) he studied theology, philosophy and oriental languages. In 1852 his studies took him to London and Paris. In 1854 he became a teacher at a Berlin public school, but this did not interrupt his biblical studies. He edited the Didascalia apostolorum syriacae (1854), and other Syriac texts collected in the British Museum and in Paris. In 1860 he received three years' leave of absence to collect fresh materials, and in 1869 succeeded Heinrich Ewald as professor of oriental languages at Göttingen. Like Ewald, Lagarde was an active worker in a variety of subjects and languages; but his chief aim, the elucidation of the Bible, was almost always kept in view. He edited the Aramaic translation (known as the Targum) of the Prophets according to the Codex Rechlinianus preserved at Carlsluhe, Prophetae chaldaicae (1872), the Hagiographa chaldaica (1874), an Arabic translation of the Gospels, Die vier Evangelien, arabisch, Paris (1878), and the Syriac translation of the Old Testament Apocrypha, Libri V. T. apocryphi syriacae (1861), a Coptic translation of the Pentateuch, Der Pentateuch koptisch (1867), and a part of the Lucianic text of the Septuagint, which he was able to reconstruct from manuscripts for nearly half the Old Testament. He devoted himself ardently to oriental scholarship, and published Zur Urschichte der Aramäer (1874) and Aramäische Studien (1877). He was also a student of Persian, publishing Isaias persicus (1883) and Persische Studien (1884). He followed up his Coptic studies with Aegyptiaca (1883), and published many minor contributions to the study of oriental languages in Gesammelte Abhandlungen (1866), Symmica (i. 1877, ii. 1880), Semitica (i. 1878, ii. 1879), Orientalia (1879-1880) and Miththeilungen (1884). Mention should also be made of the valuable Onomastica sacra (1870; 2nd ed., 1887). Lagarde also took some part in politics. He belonged to the Prussian Conservative party, and was a violent anti-Semite. The bitterness which he felt appeared in his writings. He died at Göttingen on the 22nd of December 1891.

See the article in Herzog-Hauck, Realencyclopädie; and cf. Anna de Lagarde, Paul de Lagarde (1894).

LAGASH, or SARPIRLA, one of the oldest centres of Sumerian civilization in Babylonia. It is represented by a rather low, long line of ruin mounds, along the dry bed of an ancient canal, some 3 m. E. of the Shatt-el-Hai and a little less than 10 m. N. of the modern Turkish town of Shatra. These ruins were discovered in 1877 by Ernest de Sarzec, at that time French consul at Basra, who was allowed, by the Montefich chief, Nasir Pasha, the first Walli-Pasha, or governor-general, of Basra, to excavate at his pleasure in the territories subject to that official. At the outset on his own account, and later as a representative of the French government, under a Turkish firman, de Sarzec continued excavations at this site, with various intermissions, until his death in 1901, after which the work was continued under the supervision of the Commandant Croz. The principal excavations were made in two larger mounds, one of which proved to be the site of the temple, E-Ninnu, the shrine of the patron god of Lagash, Nin-girsu or Ninib. This temple had been razed and a fortress built upon its ruins, in the Greek or Seleucid period, some of the bricks found bearing the inscription in Aramaic and Greek of a certain Hadad-nadin-akhe, king of a small Babylonian kingdom. It was beneath this fortress that the numerous statues of Gudea were found, which constitute the gem of the Babylonian collections at the Louvre. These had been decapitated and otherwise mutilated, and thrown into the foundations of the new fortress. From this stratum came also various fragments of bas reliefs of high artistic excellence. The excavations in the other larger mound resulted in the discovery of the remains of buildings containing objects of all sorts in bronze and stone, dating from the earliest Sumerian period onward, and enabling us to trace the art history of Babylonia to a date some hundreds of years before the time of Gudea. Apparently this mound had been occupied largely by store houses, in which were stored not only grain, figs, &c., but also vessels, weapons, sculptures, and every possible object, connected with the use and administration of palace and temple. In this small mound de Sarzec discovered the archives of the temple, about 30,000 inscribed clay tablets, containing the business records, and revealing with extraordinary minuteness the administration of an ancient Babylonian temple, the character of its property, the method of farming its lands, herding its flocks, and its commercial and industrial dealings and enterprises; for an ancient Babylonian temple was a great industrial, commercial, agricultural and stock-raising establishment. Unfortunately, before these archives could be removed, the galleries containing them were rifled by the Arabs, and large numbers of the tablets were sold to antiquity dealers, by whom they have been scattered all over Europe and America. From the inscriptions found at Tello, it appears that Lagash was a city of great importance in the Sumerian period, some time probably in the 4th millennium B.C. It was at that time ruled by independent kings, the kings of the Guti and Khattusilis, who were engaged in contests with the Elamites on the east and the kings of Kengi and Kh in the north. With the Semitic conquest it lost its independence, its rulers becoming patesis, dependent rulers, under Sargon and his successors; but it still remained Sumerian and continued to be a city of much importance, and, above all, a centre of artistic development. Indeed, it was in this period and under the immediately succeeding supremacy of the kings of Ur, Ur-Gur and Dungi, that it reached its highest artistic development. At this period, also, under its patesis, Ur-bau and Gudea, Lagash had extensive commercial communications with distant realms. According to his own records, Gudea brought cedars from the Amanus and Lebanon mountains in Syria, diorite or dolomite from eastern Arabia, copper and gold from central and southern Arabia and from Sinai, while his armies, presumably under his over-lord, Ur-Gur, were engaged in battles in Elam on the east. His was especially the era of artistic development. Some of the earlier works of the Nin-Nadin-akhe temple, and others, before the Semitic conquest, are also extremely interesting, especially the famous stele of the vultures and a great silver vase ornamented with what may be the coat of arms of Lagash, a lion-headed eagle with wings outspread, grasping a lion in each talon. After the time of Gudea, Lagash seems to have lost its importance; at least we know nothing more about it until the construction of the Seleucid fortress mentioned, when it seems to have become part of the Greek kingdom of Characene. The objects found at Tello are the most valuable art treasures up to this time discovered in Babylonia.

See E. de Sarzec, Découvertes en Chaldée (1888 fol.).

LAGHMAN, a district of Afghanistan, in the province of Jalalabad, between Jalalabad and Kabul, on the northern side of the Peshawar road, one of the richest and most fertile tracts in Afghanistan. It is the valley of the Kabul river between the Tagao and the Kunar and merges on the north into Kafiristan. The inhabitants, Ghilzais and Tajiks, are supposed to be the cleverest business people in the country. Sugar, cotton and rice are exported to Kabul. The Laghman route between Kabul
and India crossing the Kunar river into the Mohmand country is the route now followed by Alexander the Great and Baber; but it has now been supplanted by the Khyber.

**LAGOON** (Fr. lagune, Lat. lacuna, a pool), a term applied to
1. a sheet of salt or brackish water near the sea,
2. a sheet of fresh water of no great depth or extent,
3. the expanse of smooth water enclosed by an atoll. Sea lagoons are formed only where the shores are low and protected from wave action. Under these conditions a bar may be raised above sea-level or a spit may grow until its end touches the land. The enclosed shallow water is then isolated in a wide stretch, the seaward banks broaden, and the lagoon becomes a permanent area of still shallow water with peculiar faunal features. In the old lake plains of Australia there are occasional wide and shallow depressions where water collects permanently. Large numbers of aquatic birds, black swans, wild duck, teal, migrant spoon-bills or pelicans, resort to these fresh-water lagoons.

**LAGOS**, the western province of Southern Nigeria, a British colony and protectorate in West Africa. The province consists of three divisions: (1) the coast region, including Lagos Island, being a part of Lagos; (2) small native settlements adjacent to the colony; and (3) the northern or Yoruba country, further inland. The total area is some 27,000 sq. m., or about the size of Scotland. The province is bounded S. by the Gulf of Guinea, (from 2° 46’ 55” to 4° 30’ E.); W. by the French colony of Dahomey; N. and E. by other provinces of Nigeria.

**Physical Features.**—The coast is low, marshy and maladroit, and all along the shore the great Atlantic billows cause a dangerous surf. Behind the coast line stretches a series of lagoons, in which are small islands of mossy mud. The sand bars have an area of 170 square miles and are surrounded by mangrove swamps. The lagoons and mangrove swamps is a broad zone of dense primeval forest. The bush is cut which completely separates the arable lands from the coast. The water-pumping of the streams flowing north on both sides of the lagoon has resulted in the development of Ogun, Oti, Oshun, Omi, and Oluwa, falls in continuous undulations to the coast, the open cultivated ground gradually giving place to forest tracts, where the most characteristic tree is the oil-palm. Flowering trees, certain kinds of rubber vines, and shrubs are abundant in the lagoons. The northern regions the shea-butter tree is found. The fauna resembles that of the other regions of the Guinea coast, but large game is becoming scarce. Leopards, antelopes and monkeys are common, and on the coast, large sea-turtles are abundant.

The lagoons, lying between the outer surf-beaten beach and the inner shore line, form a navigable highway of still waters, many miles in extent. They are almost entirely free from rock, though they are often thralled with schools of fish. The most extensive are Lekki in the east, and Ikotun (Lagos) in the west. At its N.W. extremity the Lagos lagoon receives the Ogun, the largest river in Yorubaland, whose current is strong enough to keep the seaward channel open throughout the year. Hence the importance of the port of Lagos, which lies in smooth water at the northern end of this channel. The outer entrance is obstructed by a dangerous sand bar.

**Climate and Health.**—The climate is unhealthy, especially for Europeans. The rainfall has not been ascertained in the interior. In the northern districts it is probably considerably less than at Lagos, where it is about 70 in. a year. The variation is, however, very great. In 1901 the rainfall was 112 in., in 1902 but 47. These figures being respectively the highest and lowest recorded in a period of several years. Such rains occurred on the northern side of the Lagos Lagoon, the range being from 68° to 91°. At certain seasons sudden heavy squalls of wind and rain that last for a few hours are common. The hurricane and typhoon are unknown. The principal diseases are malaria, fever, dysentery, intestinal diseases, smallpox, whooping cough, measles, typhoid fever, cholera, yellow fever, dysentery, and scarlatina is noteworthy. A mild form of yaws is endemic.

**Inhabitants.**—The population is estimated at 1,750,000. The Yoruba people, a Negro race divided into many tribes, form the majority of the inhabitants. Notwithstanding their political feuds and their proved capacity as fighting men, the Yoruba are distinguished above all the surrounding races for their generally peaceable disposition, industry, friendliness, courtesy and hospitality towards strangers. They are also intensely patriotic. Physically they resemble closely their Ewe and Dahomey neighbours, but are of somewhat lighter complexion, taller and of less pronounced Negro features. They exhibit high administrative ability, possess a marked capacity for trade, and have made remarkable progress in the industrial arts. The different tribes are distinguished by tattoo markings, usually some simple pattern of two or more parallel lines, disposed horizontally or vertically on the cheeks or other parts of the face. The feeling for religion is deeply implanted among the Yoruba. The majority are pagans, or dominated by pagan beliefs, but Islam has made great progress since the cessation of the Fula wars, while Protestant and Roman Catholic missions have been at work since 1848 at Abeokuta, Oyo, Ibadan and other large towns. Samuel Crowther, the first Negro bishop in the Anglican church, who was distinguished as an explorer, geographer and linguist, was a native of Yorubaland, rescued (1822) by the English from slavery and educated at Sierra Leone (see YORUBAS).

**Towns.**—Besides Lagos (q.v.), pop. about 50,000, the chief towns in the colony proper are Epe, pop. 16,000, on the northern side of the lagoons, and Badagry (a notorious place during the slave-trade period) and Iwo, both on the coast. Inland the chief towns are Abeokuta (q.v.), pop. about 60,000, and Ibadan (q.v.), pop. estimated at 150,000.

**Agriculture and Trade.**—The chief wealth of the country consists in forest produce, the staple industries being the collection of palm-kernels and palm oil. Besides the oil-palm forests large areas are covered with timber trees, the wood chiefly cut for commercial purposes being a kind of mahogany. The destruction of immature trees and the fluctuations in price render this a very uncertain trade. The rubber industry was started in 1894, and in 1896 the rubber exported was valued at £347,000. In 1899, owing to reckless methods of tapping the vines, 75% of the rubber plants died. Precautions were then taken to preserve the remainder and allow young plants to grow. The collection of rubber recommenced in 1904 and the industry again became one of importance. A considerable area is devoted to cocoa plantations, all owned by native cultivators. Coffee and tobacco of good quality are cultivated and shea-butter is largely used as an oil. The Yoruba country is the greatest agricultural centre in West Africa. For home consumption the Yoruba grow yams, maize and millet, the chief articles of food, cassava, sweet potatoes, sesame and beans. Model farms have been established for experimental culture and for the tuition of the natives. A palatable wine is obtained from the Raphia vinifera and native beers are also brewed. Imported spirits are largely consumed. There are no manufactures on a large scale save the making of "country cloths" (from cotton grown, spin and woven in the country) and mats. Pottery and agricultural implements are made, and tanning, dyeing and foraging practised in the towns, and along the rivers and lagoons boats and canoes are built. Fishing is extensively engaged in, the fish being dried and sent up country. Except iron there are no valuable minerals in the country.

The cotton plant from which the "country cloths" are made is native to the country, the soil of which is capable of producing the very finest grades of cotton. The Egba branch of the Yoruba have the largest grove of cotton in this district. In 1869 the cotton exported was valued at £81,057, but owing to low prices the natives ceased to grow cotton for export, so that in 1879 the value of exported cotton was only £526. In 1902 planting for export was recommenced by the Egba on scientific lines, and was started in the Abeokuta district with encouraging results.

The Yoruba profess to be unable to alienate land in perpetuity, but native custom does not preclude leasing, and land concessions have been taken up by Europeans on long leases. Some concessions are only for cutting and removing timber; others permit of cultivation. The northern parts of the protectorate are specially suitable for stock raising and poultry culture.

The chief exports are palm-kernels, palm-oil, timber, rubber and cocoa. Palm-kernels alone constitute more than a half in value of the total exports, and with palm-oil over three-fourths.
LAGOS

The trade in these products is practically confined to Great Britain and Germany, the share of the first-named being 25% to Germany's 75%. Minor exports are coffee, "country cloths," maize, shea-butter and ivory.

Cotton goods are the most important of the imports, spirits coming next, followed by building material, haberdashery and hardware and tobacco. Over 90% of the cotton goods are imported from Great Britain, whilst nearly the same proportion of the spirit imports come from Germany. Nearly all the liquors consist of "Trade Spirits," chiefly gin, rum and a concoction called "alcohol," introduced (1901) to meet the growing taste of the people for stronger liquor. This stuff contained 90% of pure alcohol and sometimes over 4% of fusel oil. To hinder the sale of this noxious compound legislation was prohibited in 1903 the import of liquor containing more than 4% of fusel oil, whilst the states of Abeokuta and Ifadan prohibited the importation of liquor stronger than proof. The total trade of the country in 1905 was valued at £2,244,754, the imports slightly exceeding the exports. There is a large transit trade with Dahomey.

Communications.—Lagos is well supplied with means of communication. A 3½ ft. 6 in. gauge railway starts from Iddo Island, and extends past Abeokuta, 64 m. from Lagos, Ifadan (123 m.), Oshogbo (175 m.), to Ikorin (247 m.) in Northern Nigeria, whence the line is continued to Jebba and Zanguru (see Nigeria). Abeokuta is served by a spur line from Aro on the main line. Railway bridges connect Iddo Island both with the mainland and with Lagos Island (see Lagos, town). This line was begun in 1895 and opened to Ifadan in 1901. In 1905 the building of the section Ibadan—Ifadan—Ilorin was undertaken. The railway was built by the government and cost about £7000 per mile. The lagoon offers convenient channels for numerous small craft, which, with the exception of steam launches, are almost entirely native-built canoes. Branch steamers run between the Forcados mouth of the Niger and Lagos, and also between Lagos and Porto Novo, in French territory, and do a large transit trade. Various roads through the bush are made by the government. There is telegraphic communication with Europe, Northern and Southern Africa, and steamships ply regularly between Lagos and Liverpool, and Lagos and Hamburg (see Lagos, town).

Administration, Justice, Education, &c.—The small part of the province which constitutes "the Colony of Southern Nigeria", was governed as a crown colony. Elsewhere the native governments are retained, the chiefs and councils of elders receiving the advice and support of British commissioners. There is also an advisory native council, consisting of representatives of the various tribes, the great civil servants are natives of the country, some of whom have been educated in England. The legal status of slavery is not recognized by the law courts and dealing in slaves is suppressed. As an institution it became extinct and only ended by domestic means.

The cost of administration is met, mainly, by customs, largely derived from the duties on imported spirits. From the railways, a government monopoly, a considerable net profit is earned. Expenditure for public works, military and police, health, and education, the revenue increased in the ten years 1895-1905 from £4,023,949 to £41,250. In the same period the expenditure rose from £14,494 to £41,250.

The defence of the province is entrusted to the Lagos battalion of the West African Frontier Force, a body under the control of the Colonial Office in London and composed of Hausa (four-fifths) and Yoruba (one-fifth) from the British colony.

The judicial system in the colony proper is based on that of England. The colonial supreme court, by agreement with the rulers of Abeokuta, Ifadan and other states in the protectorate, with the chiefs of these states, all cases of importance being tried by the native courts. Other cases are tried by mixed courts, or, where Yoruba alone are concerned, by native courts.

There is a government board of education which maintains a few schools and subsides those voluntary. The established, chiefly those of various missionary societies, who, besides primary schools, have a few secondary schools. The Mahommades have their own schools. Grants from public funds are made to the voluntary schools, the native urban and the rural. All payments to manual teaching, the laws of health and the teaching of English, which is spoken by about one-fourth of the native population.

History.—Lagos was an island in the lagoon named Lagos also. Between Lagos and the mainland is Iddo Island. An iron bridge for road and railway traffic 2600 ft. long connects Lagos and Iddo Islands, and another iron bridge, 917 ft. long, joins Iddo Island to the mainland. The town lies but a foot or two above sea-level. The principal buildings are a large government house, the law courts, the merchant hall erected to commemorate the services of Sir John Glover, used for public meetings and entertainments, an elaborate club-house provided from public funds, and the police quarters. There are many substantial villages that serve as quarters for the officers of the civil service, as well as numerous solidly-built handsome private buildings. The streets are well kept; the town is supplied with electric light, and there is a good water service. The chief stores and depôts for goods are.
all on the banks of the lagoon. The swamps of which originally
Lagos Island entirely consisted have been reclaimed. In
connexion with this work a canal, 25 ft. wide, has been cut right
through the island and a sea-wall built round its western half.
There is a commodious public hospital, of the cottage type,
on a good site. There is a racecourse, which also serves as a
general public recreation ground. Shifting banks of sand form
a bar at the sea entrance of the lagoon. Extensive works were
undertaken in 1908 with a view to making Lagos an open port.
A mole has been built at the eastern entrance to the harbour
and dredgers are at work on the bar, which can be crossed by
vessels drawing 13 ft. Large ocean-going steamers anchor
not less than 2 m. from land, and goods and passengers are
there transhipped into smaller steamers for Lagos. Heavy
cargo is carried by the large steamers to Forcados, 200 m. farther
down the coast, transhipped there into branch boats, and taken
via the lagoons to Lagos. The port is 4279 m. from Liverpool,
1203 from Freetown, Sierra Leone (the nearest safe port west-
ward), and 315 from Cape Coast.

The inhabitants, about 50,000, include, besides the native
tribes, Sierra Leonis, Fanti, Krumen and the descendants of
some 6000 Brazilian emancipados who were settled here in
the early days of British rule. The Europeans number about 400.
Rather more than half the populace are Moslems.

LAGOS, a seaport of southern Portugal, in the district of Faro
(formerly the province of Algarve); on the Atlantic Ocean, and
on the estuary of the small river Lagos, here spanned by a fine
stone bridge. Pop. (1906) 8291. The city is defended by fortifi-
cations erected in the 17th century. It is supplied with water
by an aqueduct 900 yds. long. The harbour is deep, capacious,
and completely sheltered on the north and west; it is frequently
visited by the British Channel fleet. Vines and figs are extensively
cultivated in the neighbourhood, and Lagos is the centre of
important sardine and sanny fisheries. Its trade is chiefly

carried on by small coasting vessels, as there is no railway.
Lagos is on or near the site of the Roman Lacobiaca. Since
the 15th century it has held the formal rank and title of city.
Cape St Vincent, the ancient Promontorium Sacrum, and the
southwestern extremity of the kingdom, is 22 m. W. It is famous
for its connexion with Prince Henry (q.v.), the Navigator, who
here founded the town of Sagres in 1411; and for several
British naval victories, the most celebrated of which was won
in 1797 by Admiral Jervis (afterwards Earl St Vincent) over a
larger Spanish squadron. In 1759 Admiral Boscawen defeated
a French fleet off Lagos. The great earthquake of 1755 destroyed
a large part of the city.

LA GRACE, or LES GRACES, a game invented in France during
the first quarter of the 19th century and called there le jeu des
Graces. It is played with two light sticks about 16 in. long and
a wicker ring, which is projected into the air by placing it over
the sticks crossed and then separating them rapidly. The ring
is caught upon the stick of another player and thrown back,
the object being to prevent it from falling to the ground.

LA GRAND’ COMBE, a town of southern France, in the depart-
ment of Gard on the Gardon, 39 m. N.N.W. of Nimes by rail.
Pop. (1906) town, 6406; commune, 11,202. There are extensive
coal mines in the vicinity.

LAGRANGE, JOSEPH LOUIS (1736-1813), French mathe-
matician, was born at Turin, on the 25th of January 1736. He
was of French extraction, his great grandfather, a cavalry
captain, having passed from the service of France to that of
Sardinia, and settled in Turin under Emmanuel II. His father,
Joseph Louis Lagrange, married Maria Theresa Gros, only
dughter of a rich physician at Cambiano, and had by her eleven
children, of whom only the eldest (the subject of this notice)
and the youngest survived infancy. His education as treasurer
at war, together with his wife’s fortune, provided him with
ample means, which he lost by rash speculations, a circumstance
regarded by his son as the prelude to his own good fortune; for
had he been rich, he used to say, he might never have known
mathematics.

The genius of Lagrange did not at once take its true bent.

His earliest tastes were literary rather than scientific, and he
learned the rudiments of geometry during his first year at the
college of Turin, without difficulty, but without distinction.
The perusal of a tract by Halley (Phil. Trans. xviii. 960)
roused his enthusiasm for the analytical method, of which he
was destined to develop the utmost capabilities. He now entered,
unaided save by his own unerring tact and vivid apprehen-

sion, upon a course of study which, in two years, placed him on a level
with the greatest of his contemporaries. At the age of nineteen
he communicated to Leonard Euler his idea of a general method
of dealing with “isoperimetrical” problems, known later as the
Calculus of Variations. It was eagerly welcomed by the
Berlin mathematician, who had the generosity to withhold from
publication his own further researches on the subject, until his
youthful correspondent should have had time to complete and
opportunity to claim the invention. This prosperous opening
gave the key-note to Lagrange’s career. Appointed, in 1754,
Professor of geometry in the royal school of artillery, he formed
with some of his pupils—for the most part his seniors—friend-
ships based on community of scientific ardour. With the aid of
the marquis de Saluces and the anatomist G. F. Cigna,
he founded in 1758 a society which became the Turin Academy of
Sciences. The first volume of its memoirs, published in
the following year, contained a paper by Lagrange entitled
Recherches sur la nature et la propagation du son, in which the power of
his analysis and his address in its application were equally con-
nspicuous. He made his first appearance in public as the critic
of Newton, and the arbiter between d’Alembert and Euler.
By considering only the particles of air found in a right line, he
reduced the problem of the propagation of sound to the solution
of the same partial differential equations that include the motions
of vibrating strings, and demonstrated the insufficiency of the
methods employed by both his great contemporaries in dealing
with the latter subject. He further treated in a masterly manner
of echoes and the texture of sounds, and explained the pheno-
menon of grave harmonics as due to the occurrence of beats so
rapid as to generate a musical note. This was followed, in the
second volume of the Miscellanea Taurinensia (1762) by his
“Essai d’une nouvelle méthode pour déterminer les maxima et
les minima des formules intégrales indéfinies,” together with the
application of this important development of analysis to the
solution of several dynamical problems, as well as to the demon-
stration of the mechanical principle of “least action.”

The essential point in his advance on Euler’s mode of investigat-
ing curves of maximum or minimum consisted in his purely analytical
conception of the subject. He not only freed it from all trammels
of geometrical construction, but by the introduction of the symbol δ gave it the efficacy of a new calculus. He is thus justly
regarded as the inventor of the “method of variations”—a
name supplied by Euler in 1766.

By these performances Lagrange found himself, at the age
of twenty-six, on the summit of European fame. Such a height
had not been reached without cost. Intense application
during early youth had weakened a constitution never robust, and led
to access of feverish exaltation culminating, in the spring of
1761, in an attack of bilious hypochondria, which permanently
lowered the tone of his nervous system. Rest and exercise,
however, temporarily restored his health, and he gave proof
of the undiminished vigour of his powers by carrying off, in
1764, the prize offered by the Paris Academy of Sciences for the
best essay on the liberation of the moon. His treatise was
remarkable, not only as offering a satisfactory explanation of the
coincidence between the lunar periods of rotation and revolution,
but as containing the first employment of his radical formula
of mechanics, obtained by combining with the principle of
d’Alembert that of virtual velocities. His success encouraged the
French Academy to propose, in 1766, as a theme for competition,
the hitherto unattempted theory of the Jovian system. The
prize was again awarded to Lagrange; and he earned the same
distinction with essays on the problem of three bodies in 1772,
on the secular equation of the moon in 1774, and in 1778 on the
theory of cometary perturbations.
He had in the meantime gratified a long felt desire by a visit to Paris, where he enjoyed the stimulating delight of conversing with such mathematicians as A. C. Clairaut, d’Alembert, Condorcet and the Abbé Marie. Illness prevented him from visiting London. The post of director of the mathematical department of the Berlin Academy (of which he had been a member since 1756) becoming vacant by the removal of Euler to St Petersburg, the latter and d’Alembert united to recommend Lagrange as his successor. Euler’s eulogium was enhanced by his desire to quit Berlin, d’Alembert’s by his dread of a royal command to repair thither; and the result was that an invitation, conveying the wish of the “greatest king in Europe” to have the “greatest mathematician” at his court, was sent to Turin. On the 6th of November 1766, Lagrange was installed in his new position, with a salary of 6000 francs, ample leisure for scientific research, and royal favour sufficient to secure him respect without exciting envy. The national jealousy of foreigners, was at first a source of annoyance to him; but such prejudices were gradually dissipated by the inoffensiveness of his demeanour. We are told that the universal example of his conduct, so far as any desire for female society, impelled him to matrimony; his choice being a lady of the Conti family, who, by his request, joined him at Berlin. Soon after marriage his wife was attacked by a lingering illness, to which she succumbed, Lagrange devoting all his time, and a considerable store of medical knowledge, to her care.

The long series of memoirs—some of them complete treatises of great moment in the history of science—communicated by Lagrange to the Berlin Academy between the years 1759 and 1787 were not the only fruits of his exile. His Mécanique analytique, in which his genius most fully displayed itself, was produced during the same period. This great work was the perfect realization of a design conceived by the author almost in boyhood, and clearly sketched in his first published essay. Its scope may be briefly described as the reduction of the theory of mechanics to certain general formulae, from the simple development of which should be derived the equations necessary for the solution of each separate problem. From the fundamental principle of virtual velocities, which thus acquired a new significance, Lagrange deduced, with the aid of the calculus of variations, the whole system of mechanical truths, by processes so elegant, lucid and harmonious as to constitute, in Sir William Hamilton’s words, “a kind of scientific poem.” This unification of method was one of matter also. By his mode of regarding a liquid as a material system characterized by the unshackled mobility of its minutest parts, the separation between the mechanics of matter in different forms of aggregation finally disappeared, and the fundamental equation of forces was for the first time extended to hydrostatics and hydrodynamics. Thus a universal science of matter and motion was derived, by an unbroken sequence of deduction, from one radical principle; and analytical mechanics assumed the clear and complete form of logical perfection which it now wears.

A publisher having with some difficulty been found, the book appeared at Paris in 1788 under the supervision of A. M. Legendre. But before that time Lagrange himself was on the spot. After the death of Frederick the Great, his presence was competed for by the courts of France, Spain and Naples, and a residence in Berlin having ceased to possess any attraction for him, he removed to Paris in 1787. Marie Antoinette warmly patronized him. He was lodged in the Louvre, received the grant of an income equal to that he had hitherto enjoyed, and, with the title of “veteran pensioner” in lieu of that of “foreign associate” (conferred in 1772), the right of voting at the deliberations of the Academy. In the midst of these distinctions, a profound melancholy seized upon him. His mathematical enthusiasm was for the time completely quenched, and during two years the printed volume of his Mécanique, which he had seen only in manuscript, lay unopened beside him. He relieved his dejection with miscellaneous studies, especially with that of chemistry, which, in the new form given to it by Lavoisier, he found “aise comme l’algèbre.” The Revolution roused him once more to activity and cheerfulness. Curiosity impelled him to remain and watch the progress of such a novel phenomenon; but curiously was changed into dismay as the terrific character of the phenomenon unfolded itself. He now bitterly regretted his temerity in braving the danger. “Tu l’as voulu” he would repeat self-reproachfully. Even from revolutionary tribunals, however, the name of Lagrange uniformly commanded respect. His pension was continued by the National Assembly, and he was partially indemnified for the depreciation of the currency by remunerative appointments. Nominated president of the Academical commission for the reform of weights and measures, his services were retained when its “purification” by the Jacobins removed his most distinguished colleagues. He again sat on the commission of 1799 for the construction of the metric system, and by his zealous advocacy of the decimal principle largely contributed to its adoption.

Meanwhile, on the 31st of May 1792 he married Mademoiselle Lemomier, daughter of the long deceased owner of that name, a young and beautiful girl, whose devotion ignored disparity of years, and formed the one tie with life which Lagrange found it hard to break. He had no children by either marriage. Although specially exempted from the operation of the decree of October 1793, imposing banishment on foreign residents, he took alarm at the fate of J. S. Bailly and A. L. Lavoisier, and prepared to resume his former situation in Berlin. His design was frustrated by the establishment of and his official connexion with the Ecole Normale, and the Ecole Polytechnique. The former institution had an ephemeral existence; but amongst the benefits derived from the foundation of the Ecole Polytechnique one of the greatest, it has been observed, was the restoration of Lagrange to mathematics. The remembrance of his teachings was long treasured by such of his auditors—amongst whom were J. B. J. Delambre and S. F. Lacroix—as were capable of appreciating them. In expounding the principles of the differential calculus, he started, as it were, from the level of his pupils, and ended with them by almost insensible gradations from elementary to abstruse conceptions. He seemed, not a professor amongst students, but a learner amongst learners; pauses for thought alternated with luminous exposition; invention accompanied demonstration; and thus originated his Théorie des fonctions analytiques (Paris, 1797). The leading idea of this work was contained in a paper published in the Berlin Memoirs for 1772. Its object was the elimination of the, to some minds, unsatisfactory conception of the infinite from the metaphysics of the higher mathematics, and the substitution for the differential and integral calculus of an analogous method depending wholly on the serial development of algebraical functions. By means of this “calculation of derived functions” Lagrange hoped to give to the solution of all analytical problems the utmost “rigour of the demonstrations of the ancients”; but it cannot be said that the attempt was successful. The validity of his fundamental position was impaired by the absence of a well-constituted theory of series; the notation employed was inconvenient, and was abandoned by its inventor in the second edition of his Mécanique; while his scruples as to the admission into analytical investigations of the idea of limits or vanishing ratios have long since been laid aside as idle. Nowhere, however, were the keenness and clearness of his intellect more conspicuous than in this brilliant effort, which, if it failed in its immediate object, was highly effective in secondary results. His purely abstract mode of regarding functions, apart from any mechanical or geometrical considerations, led the way to a new and sharply characterized development of the higher analysis in the hands of A. Cauchy, C. G. Jacobi, and others. The Théorie des fonctions is divided into three parts, of which the first explains the general doctrine of functions, the second deals with its...
application to geometry, and the third with its bearings on mechanics.

On the establishment of the Institute, Lagrange was placed at the head of the section of geometry; he was one of the first members of the Bureau des Longitudes; and his name appeared in 1791 on the list of foreign members of the Royal Society. On the annexation of Piedmont to France in 1796, a touching compliment was paid to him in the person of his aged father. By direction of Talleyrand, then minister for foreign affairs, the French commission repaired in state to the old man's residence in Turin, to congratulate him on the merits of his son, whom they declared "to have done honour to mankind by his genius, and whom Piedmont was proud to have produced, and France to possess." Bonaparte, who styled him "la haute pyramide des sciences mathématiques," loaded him with personal favours and official distinctions. He became a senator, a count of the empire, a grand officer of the legion of honour, and just before his death received the grand cross of the order of réunion.

The preparation of a new edition of Lagrange's Mécanique analytique exhausted his already failing powers. Frequent fainting fits gave pre-iance to a speedy end, and on the 8th of April 1813 he had a final interview with his friends B. Lacépède, G. Monge and J. A. Chaptal. He spoke with the utmost calm of his approaching death: "c'est une dernière fonction," he said, "qui n'est ni pénible ni désagréable." He nevertheless looked forward to a future meeting, when he promised to complete the autobiographical details which weakness obliged him to interrupt. They remained untold, for he died two days later on the 10th of April, and was buried in the Pantheon, the funeral oration being pronounced by Laplace and Lacépède.

Amongst the brilliant group of mathematicians whose magnificent rivalry contributed to accomplish the task of generalization and determination of the laws of nature, there is none who deserve for the 19th century, Lagrange occupies an eminent place. It is indeed by no means easy to distinguish and appertain the respective merits of the competitors. This is especially the case between Lagrange and Euler on the one side, and between Lagrange and Laplace on the other. The calculus of variations remained undeveloped in Euler's mode of treating isoperimetrical problems. The fruitful method, again, of the variation of elements was introduced by Euler, but adopted and perfected by Lagrange, who first recognized its supreme importance to analytical mechanics. The young mathematician was admitted unrivaled. Lagrange owned that he had despaired of effecting the integration of the differential equations relative to secular inequalities until Lagrange showed him the way. But Euler's method, he says, was more the spirit of a mathematician and the intuition of physical truth. Lagrange saw in the problems of nature so many occasions for analytical triumphs; Lagrange regarded analytical triumphs as the means of solving the problems of nature; but he felt that he had not the character of a mathematician and the intuition of physical truth. Lagrange saw in the problems of nature so many occasions for analytical triumphs; Lagrange regarded analytical triumphs as the means of solving the problems of nature.

The notable group of treatises communicated, 1781–1784, to the Berlin Academy, was designed, but did not prove to be his final contribution to the theory of the planets. After an interval of ten years, an interval during which Lagrange, who died on the 20th of June 1808, was once more attacked by Lagrange with all his pristige vigour and vigour of invention. Resuming the inquiry into the inequality of mean motions, Poisson carried the computation, the approximation, the theoretical and the practical, as far as the squares of the disturbing forces, hitherto neglected, with the same result as to the stability of the system. He had not attempted to include in his calculations the orbital variations of the disturbing bodies; but Lagrange had undertaken this step, and in 1806, twenty years after the circumstances of the discovery that Laplace, on being made acquainted by Lagrange with his new method, produced analogous expressions, to which his independent researches had led him. The final achievement of Lagrange was the determination of the variation of arbitrary constants, successfully used by him in the investigation of periodical as well as of secular inequalities, to any system whatever of mutually interacting bodies.

Without astonishment," even to himself, regard being had to the great generality of the differential equations, he reached a result so wide as to include, as a particular case, the solution of the planetary problem recently obtained by him. He proposed to apply the same method of the calculation of the disturbances produced in the rotation of the planets by external action on their equatorial protuberances, but was anticipated by Poisson, who gave formulae for the variation of the elements of rotation strictly corresponding with those obtained by Lagrange.

The Mécanique analytique was undertaken mainly for the purpose of embodying in it these new methods and final results, but was interrupted, when two-thirds completed, by the death of its author.

In the advancement of almost every branch of pure mathematics Lagrange took a conspicuous part. The calculus of variations is indissolubly associated with his name. In the theory of numbers he took the lead in the applications of the calculus of finite differences to the determination of the periods of the pendulum, and added some of his own. In algebra he discovered the method of approximating to the real roots of an equation by means of continued fractions, and imagined a general process of solving algebraical equations which had been proposed, among others, by Wronski and Prony.

To Lagrange, perhaps more than to any other, the theory of differential equations is indebted for its position as a science, rather than a collection of ingenious artifices for the solution of particular problems. The method of determining the coefficients of the beautiful formula of interpolation which bears his name; although substantially the same result seems to have been previously obtained by Euler. But it was in the application to mechanical questions of the discovery of the simplest method of solving the equations of motion with which he made his most famous discovery.

It was his just boast to have transformed mechanics (defined by him as a "geometry of four dimensions") into a branch of analysis, and to have exhibited the so-called mechanical principles as simple formulae which, in the words of Lagrange, "generalised coordinates," as it is now called, by which he attained this result, is the most brilliant achievement of the analytical method.

Instead of following the motion of each individual part of a material system, he showed that if the determinants of a certain class of quadratic and other polynomials of a number of variables, whose number is that of the degrees of freedom, the kinetic and potential energies of the system can be expressed in terms of these, and the equations of motion of the system can be obtained by simple differentiation. Besides this most important contribution to the general fabric of dynamical science, we owe to Lagrange several minor theorems of great elegance,—among which may be mentioned his theorem that the kinetic energy imparted to the elements of a planetary system by the gravitational forces is a minimum. To this entire branch of knowledge, in short, he successfully imparted that character of generality and completeness towards which his labours invariably tended.
LAGRANGE-CHANCEL—LA GUAIRA

Oeuvres de Lagrange, publiées sous les soins de M. J. A. Serret (Paris, 1867–1877). The first, second and third sections of this publication comprise respectively the papers communicated to him by the Academies of Sciences of Turin, Berlin and Paris; the fourth includes communications to other scientific collections, together with his additions to Euler’s Algebra, and "Oeuvres électorales" at the Ecole Nормale in 1795. Delambre’s notice of his life, extracted from the Mem. de l’ Instituit, 1812, is prefixed to the first volume. Lagrange’s first and last names are Resolution des équations numériques (1798, 2nd ed., 1808), and Leçons sur le calcul des fonctions (1805, 2nd ed., 1806), designed as a commentary and supplement to the first part of the Théorie des fonctions. His first volume of the enlarged edition of the Mécanique appeared in 1811, the second, of which the revision was made by MM Prony and Binet, in 1815. A third edition, in 2 vols. 4to, was issued in 1853–1855, and a second of the Théorie des fonctions in 1813.

*LA GRANGE-CHANTER [CHANTEL]*

FRAÇOIS JOSEPH (1677–1758), French dramatist and satirist, was born at Périgueux on the 1st of January 1677. He was an extremely precocious boy, and at Bordeaux, where he was educated, he produced a play there when he was nine years old. Five years later his mother took him to Paris, where he found a patron in the princesse de Conti, to whom he dedicated his tragedy of Jugurtha or, as it is called later, Adherbal (1694). Richard had given him advice and was present at the first performance, although he had lived in complete retirement. Other plays followed: Oronte et Pyladé (1697), Millegré (1699), Amasie (1701), and Ino et Mélite (1715). Lagrange hardly realized the high hopes raised by his precocity, although his only serious rival on the tragic stage was Camispon, but he obtained high favour at court, becoming maître d’hôtel to the duchess of Orleans. This prosperity ended with the publication in 1720 of his Philiquèques, odes advising the regent, Philip, duke of Orleans, of the most odious crimes. He might have escaped the consequences of this libel but for the bitter enmity of a former patron, the due de La Force. Lagrange found sanctuary at Avignon, but was enticed beyond the borders of the papal jurisdiction, where he was arrested and sent as a prisoner to the isles of Sainte Marguerite. He contrived, however, to escape to Corinna and thence to Spain and Holland, where he produced his fourth and fifth Philiquèques. On the death of the regent he was able to return to France. He was part author of a Histoire de Périgord left unfinished, and made a further contribution to history, or perhaps, more exactly, to romance, in a letter to Elie Fréon on the identity of the Man with the Iron Mask. Lagrange’s family life was embellished by a long lawsuit against his son. He died at Périgueux at the end of December 1758.

He had collected his own works (5 vols., 1758) some months before his death. His most famous work, the Philiquèques, was edited by M. J. Serret in 1858, and a sixth philippic by M. Diancourt in 1886.

LA GRANJA, or SAN IDELENSO, a summer palace of the kings of Spain, on the south-eastern border of the province of Segovia, and on the western slopes of the Sierra de Guadarrama, 7 m. by road S.E. of the city of Segovia. The royal estate is 3905 ft. above sea-level. The scenery of this region, especially in the gorge of the river Lozoya, with its granite rocks, its dense forest of pines, firs and birches, and its red-tiled farms, more nearly resembles the highlands of northern Europe than any other part of Spain. La Granja has an almost alpine climate, with a clear, cool atmosphere and abundant sunshine. Above the palace rise the wooded summits of the Guadarrama, culminating in the peak of Peñalara (7891 ft.); in front of it the wide plains of Segovia extend northwards. The village of San Ildefonso, the oldest part of the estate, was founded in 1450 by Henry IV., who built a hunting lodge and chapel here. In 1477 the chapel was presented by Ferdinand and Isabella to the monks of the Parral, a neighbouring Hieronymite monastery. The original granja (i.e. grange or farm), established by the monks, was purchased in 1719 by Philip V., after the destruction of his summer palace at Valsaín, the ancient Vallis Sapinorum, 2 m. S. Philip determined to convert the estate into a second Versailles. The palace was built between 1721 and 1723. Its façade is fronted by a mascaron in which the pillars reach to the roof. The state apartments contain some valuable 18th-century furniture, but the famous collection of sculptures was removed to Madrid in 1836, and is preserved there in the Museo del Prado. At La Granja it is represented by facsimiles in plaster. The collegiate church adjoining the palace dates from 1725, and contains the tombs of Philip V. and his consort Isabella Farnese. An artificial lake called El Mar, 4005 ft. above sea-level, irrigates the gardens, which are imitated from those of Versailles, and supplies water for the fountains. These, despite the antiqutated and sometimes tasteless style of their ornamentation, are probably the finest in the world; it is noteworthy that, owing to the high level of the lake, no pumps or other mechanism was needed to supply pressure. There are twenty-six fountains between lakes and waterfalls. Among the most remarkable are the group of the Perseus, Andromeda and the Sea-Monster, which sends up a jet of water 110 ft. high, the "Fame," which reaches 125 ft., and the very elaborate Bath of Diana. It is of the last that Philip V. is said to have remarked, "It has cost me three millions and amused me three minutes." Most of the fountains were made by order of Queen Isabella in 1727, during the king’s absence. The glass factory of San Ildefonso was founded by Charles III.

It was in La Granja that Philip V. resigned the crown to his son in January 1742, to resume it after his son’s death seven months later; that the treaties of 1777, 1778, 1796 and 1800 were signed (see Spain: History); that Ferdinand VII. summoned Don Carlos to the throne in 1832, but was induced to alter the succession in favour of his own infant daughter Isabella, thus involving Spain in civil war; and that in 1846 a military revolt compelled the Queen-regent Christina to restore the constitution of 1812.

LAGRÉE, LOUIS JEAN FRANÇOIS (1724–1805), French painter, was a pupil of Carle Vanloo. Born at Paris on the 30th of December 1724, in 1755 he became a member of the Royal Academy, presenting as his diploma picture the "Rape of Deianira" (Louvre). He visited St Petersburg at the call of the empress Elizabeth, and on his return was named in 1781 director of the French Academy at Rome; he there painted the "Indian Widow," one of his best-known works. In 1804 Napoleon conferred on him the cross of the legion of honour, and on the 10th of June 1805 he died in the Louvre, of which he was honorary keeper.

LA GUAIIRA, or LA GAYTRA (sometimes LAGUAIRA, &c.), a town and port of Venezuela, in the Federal district, 23 m. by rail and 64 m. in a direct line N. of Caracas. Pop. (1904, estimate) 14,000. It is situated between a precipitous mountain side and a broad, semi-circular indentation of the coast line which forms the roadstead of the port. The anchorage was long considered one of the most dangerous on the Venezuelan coast, and landing was attended with much danger. The harbour has been improved by the construction of a concrete breakwater running out from the eastern shore 2044 ft., built up from an extreme depth of 46 ft. or from an average depth of 29 ft., and rising 193 ft. above sea-level. This encloses an area of 768 acres, having an average depth of nearly 28 ft. The harbour is further improved by 1870 ft. of concrete quays and 1397 ft. of retaining sea-wall, with several piers (three covered) projecting into deep water. These works were executed by a British company, known as the La Guaira Harbour Corporation, Ltd., and were completed in 1891 at a cost of about one million sterling. The commerce of 1890 for 99 years and the additional charges which the company is authorized to impose are necessarily heavy. These improvements and the restrictions placed upon the direct trade between West Indian ports and the port of Guaira have greatly increased the foreign trade of La Guaira, which in 1905 was 52% of that of the four puertos habilitados of the republic. The shipping
entries of that year numbered 217, of which 203 entered with general cargo and 14 with coal exclusively. The exports included 152,625 bags coffee, 114,947 bags cacao and 152,891 hides. For 1905-1906 the imports at La Guaira were valued officially at £767,365 and the exports at £693,708. The city stands on sloping ground stretching along the circular coast line with a varying width of 130 to 330 ft. and having the appearance of an amphitheatre. The port improvements added 18 acres of reclaimed land to La Guaira’s area, and the removal of old shore batteries likewise increased its available breadth. In this narrow space is built the town, composed in great part of small, roughly-made cabins, and narrow, badly-paved streets, but with good business houses on its principal street. From the mountain side, reddish-brown in colour and bare of vegetation, the solar heat is reflected with tremendous force, the mean annual temperature being 84° F. The seaside towns of Maiquetia, 2 m. W. and Macuto, 3 m. E., which have better climatic and sanitary conditions and are connected by a narrow-gauge railway, are the residences of many of the wealthier merchants of La Guaira.

La Guaira was founded in 1588, was sacked by filibusters under Amias Preston in 1605, and by the French under Grammont in 1680, was destroyed by the great earthquake of the 26th of March 1812, and suffered severely in the war for independence. In 1893, pending the settlement of claims of Great Britain, Germany and Italy against Venezuela, La Guaira was blockaded by a British, German-Italian squadron.

His elder brother, Alfred Dubreuil Hélion, Comte de La Guérondière (1810-1884), who remained faithful to the Legitimist party, was also a well-known writer and journalist. He was consistent in his opposition to the July Monarchy and the Empire, but in a series of books on the crisis of 1870-1871 showed a more favourable attitude to the Republic.

Laguerrre, Jean Henri Georges (1838-1893), French lawyer and politician, was born in Paris on the 24th of June 1838. Called to the bar in 1879, he distinguished himself by brilliant pleadings in favour of socialist and anarchist leaders, defending Prince Kropotkin at Lyons in 1883, Louise Michel in the same year; and in 1886, with A. Millerand as colleague he defended Ernest Roché and Duc Quercy, the instigators of the Decazesville strike. His strictures on the procureur de la République on this occasion being declared libellous he was suspended for six months and in 1890 he again incurred suspension for an attack on the attorney-general, Quesnay de Beaupréau.

He lost his fortune in the course of his time, though from 1893 onwards exclusively in the provinces, his exclusion from the Parisian bar having been secured on the pretext of his connexion with La Presse. He entered the Chamber of Deputies for Apt in 1883 as a representative of the extreme revisionist programme, and was one of the leaders of the Boulangist agitation. He had formerly written for Georges Clemenceau’s organ La Justice, but when Clemenceau refused to impose any shibboleth on the radical party he became director of La Presse. He rejoined to the republican party in May 1891, some months before General Boulanger’s suicide. He was not re-elected to the Chamber in 1893. Laguerrre was an excellent lecturer on the revolutionary period of French history, concerning which he had collected many valuable and rare documents. He interested himself in the fate of the “Little Dauphin” (Louis XVII.), whose supposed remains, buried at Ste Marguerite, he proved to be those of a boy of fourteen.

Laguna, or La Laguna, an episcopal city and formerly the capital of the island of Tenerife, in the Spanish archipelago of the Canary Islands. Pop. (1890) 2,074. Laguna is 4 m. N. by W. of Santa Cruz, in a plain 230 ft. above sea-level, surrounded by mountains. Snow is unknown here, and the mean annual temperature exceeds 63° F; but the rainfall is very heavy, and in winter the plain is sometimes flooded. The humidity of the atmosphere, combined with the warm climate and rich volcanic soil, renders the district exceptionally fertile; wheat, wine and tobacco, oranges and other fruits, are produced in abundance. Laguna is the favourite summer residence of the wealthier inhabitants of Santa Cruz. Besides the cathedral, the city contains several picturesque convents, now secularized, a fine modern town hall, hospitals, a large public library and some ancient palaces of the Spanish nobility. Even the modern buildings have often an appearance of antiquity, owing to the decay caused by damp and the luxuriant growth of climbing plants.

La Harpe, Jean François de (1730-1803), French critic, was born in Paris of poor parents on the 20th of November 1730. His father, who signed himself Delharpe, was a descendant of a noble family originally of Vauc. Left an orphan at the age of nine, La Harpe was taken care of for six months by the sisters of charity, and his education was provided for by a scholarship at the Collège d’Harcourt. When nineteen he was imprisoned for some months on the charge of having written a satire against his protectors at the college. La Harpe always denied his guilt, but this culminating misfortune of an early life spent entirely in the position of a dependent had possibly something to do with the bitterness he evinced in later life. In 1763 his tragedy of Warwick was played before the court. This, his first play, was perhaps the best he ever wrote. The many authors whom he afterwards offended were always able to observe that the critic’s own plays did not reach the standard of excellence he set up. Timoleon (1764), Pharamond (1765) and Gustave Wasa (1766) were failures. Mélanie was a better play, but was never represented.

The success of Warwick led to a correspondence with Voltaire, who addressed to him a high compliment and asked him to correct his verses. In 1764 La Harpe married the daughter of a coffee house keeper. This marriage, which proved very unhappy and was dissolved, did not improve his position. They were very poor, and for some time were guests of Voltaire at Ferney. When, after Voltaire’s death, La Harpe in his praise of the philosopher ventured on some reasonable, but rather ill-timed, criticism of individual works, he was accused of treachery to one who had been his constant friend. In 1768 he returned from Ferney to Paris, where he began to write for the Mercure. He was a born fighter and had small mercy on the authors whose work he handled. But he was himself violently attacked, and suffered under many epigrams, especially those of Lebrun-Pindare. No more striking proof of the general hostility can be given than his reception (1776) at the Academy, which Sainte-Beuve calls his “execution.” Marmontel, who received him, used the occasion to eulogize La Harpe’s predecessor, Charles Pierre Colardieu, especially for his pacific, modest and indulgent disposition. The author addressed to the audience, who chose to regard it as a series of sarcasms on the new member. Eventually La Harpe was compelled to resign from the Mercure, which he had edited from 1770. On the stage he produced Les Barmécides (1778), Philoctète, Joanna de Naples (1781), Les Brames (1783), Coriolan (1784), Virginiè (1786). In 1786 he began a course of literature at the newly-established Lycée. In these lectures, published as the Cours de littérature ancienne et moderne, La Harpe is at his best, for he found a standpoint more or less independent of contemporary polemics. He is said to be inexact in dealing with the ancients,
LAHIRE—LA HOGUE, BATTLE OF

and he had only a superficial knowledge of the middle ages, but he is excellent in his analysis of 17th-century writers. Sainte-Beuve found in him the best critic of the French school of tragedy, which reached its perfection in Racine. La Harpe was a disciple of "philosophes," he supported the extreme party through the excesses of 1792 and 1793. In 1793 he edited the *Mercure de France* which adhered blindly to the revolutionary leaders. But in April 1794 he was nevertheless seized as a "suspect." In prison he underwent a spiritual crisis which he described in converting language, and he emerged an ardent Catholic and a reactionist in politics. When he resumed his chair at the Lycée, he attacked his former friends in politics and literature. He was imprudent enough to begin the publication (1801-1807) of his *Correspondance littéraire* (1774-1791) with the grand-duke afterwards the emperor Paul of Russia. In these letters he surpassed the brunt of the *Mercure*. He contracted a second marriage, which was dissolved after a few weeks by his wife. He died on the 11th of February 1803 in Paris, leaving in his will an incongruous exhortation to his fellow countrymen to maintain peace and concord. Among his posthumous works was a *Propoëtde la Caze* which Sainte-Beuve pronounces his best work. It is a sombre description of a dinner-party of notables long before the Revolution, when Jacques Cazotte is made to prophesy the frightful fates awaiting the various individuals of the company.

Among his works not already mentioned are:—Commentaire sur Racine (1795-1796), published in 1807; Commentaire sur le théâtre de Voltaire of earlier date (published posthumously in 1814), and an epic poem, *L'Impérium* (1803). His *Histoire de la littérature* has been reprinted. To the edition of 1825-1826 is prefixed a notice by Pierre Daunou. See also Sainte-Beuve, *Coursiers du lendemain*, vol. v.; G. Peignot, *Recherches historiques, bibliographiques et littéraires...* in La Harpe (1893).

LAHIRE, LAURENT DE (1660-1685). French painter, was born at Paris on the 27th of February 1660. He became a pupil of Lallemand, studied the works of Primaticcio at Fontainebleau, but never visited Italy, and belongs wholly to that transition period which preceded the school of Simon Vouet. His picture of Nicolas V. opening the crypt in which he discovers the corpse of St. Francis of Assisi standing (Louvre) was executed in 1630 for the Capuchins of the Marais; it shows a gravity and sobriety of character which marked Lahire's best work, and seems not to have been without influence on Le Sueur. The Louvre contains eight other works, and paintings by Lahire are in the museums of Strasbourg, Rouen and Le Mans. His drawings, of which the British Museum possesses a fine example, "Presentation of the Virgin in the Temple," are treated as seriously as his paintings, and sometimes show simplicity and dignity of effect. The example of the Capuchins, for whom he executed several other works in Paris, Rouen and Fécamp, was followed by the goldsmiths' company, for whom he produced in 1635 "St. Peter healing the Sick" (Louvre) and the "Conversion of St. Paul" in 1637. In 1646, with eleven other artists, he founded the French Royal Academy of Painting and Sculpture. Richelieu called Lahire to the Palais Royal; Chancellor Séguier, Taillevent de Réaux and many others entrusted him with important works of decoration; for the Gobelins he designed a series of large compositions. Lahire painted also a great number of portraits, and in 1654 united in one work for the town-hall of Paris those of the principal dignitaries of the municipality. He died on the 28th of December 1656.

LAHN, a river of Germany, a right-bank tributary of the Rhine. Its source is on the Jagdberg, a summit of the Rothaar Mountains, in the cellar of a house (Lahnhof), at an elevation of 1755 ft. It flows at first eastward and then southwest to Giessen, then turns south-westward and with a winding course reaches the Rhine between the towns of Oberhahnstein and Niederhahnstein. Its valley, the lower part of which divides the Taunus hills from the Westerwald, is often very narrow and precipitous; among the towns and sites of interest on its banks are Marburg and Giessen with their universities, Wetzlar with its cathedral, Runkel with its castle, Limburg with its cathedral, the castles of Schaumburg, Baldenstein, Laurenburg, Langenau, Burstein and Nassau, and the well-known health resort of Elms. The Lahn is about 153 m. long; it is navigable from its mouth to Giessen, and is partly canalized. A railway follows the valley practically throughout. In 1796 there were here several encounters between the French under General Jourdan and the troops of the archduke Johan, which resulted in the retreat of the French across the Rhine.

LAHND (properly Lahná or Lahíná, western, or Lahndlé-dí boi, the language of the West), an Indo-Aryan language spoken in the western Punjab. In 1901 the number of speakers was 3,337,017. Its eastern boundary is very indefinite as the language gradually merges into the Panjabi immediately to the east, but it is conventionally taken as the river Chenab from the Kashmir frontier to the town of Ramnagar, and thence as a straight line to the south-west corner of the district of Montgomery. Lahnda is also spoken in the north of the state of Bahawalpur and of the province of Sind, in which latter locality it is known as Siraki. Its western boundary is, roughly speaking, the river Indus, across which the language of the Afghan population is Pashto (Pushtu), while the Hindú settlers still speak Lahnda. In the Derajat, however, Lahnda is the principal language of all classes in the plains west of the river.

Lahnda is also known as Western Panjabi and as Jatki, or the language of the Jats, who form the bulk of the population whose mother-tongue it is. In the Derajat it is called Hindko or the language of Hindus. In 1819 the Serampur missionaries published a Lahnda version of the New Testament. They called the language Uchchí, from the important town of Uch near the confluence of the Jhelam and the Chenab. This name is commonly met with in old writings. It has numerous dialects, which fall into two main groups, a northern and a southern, the speakers of which are separated by the Salt Range. The principal varieties of the northern group are Hindki (the same in meaning as Hindko) and Pothwárí. In the southern group the most important are Khétrâní, Multání, and the dialect of Shaipur. The language possesses no literature.

Lahnda belongs to the north-western group of the outer band of Indo-Aryan languages (Gr.), the other members being Kashmiri (Gr.) and Sindhi, with both of which it is closely connected. See Sindhi; also HINDOSTANI.

LA HOGUE, BATTLE OF, the name now given to a series of encounters which took place from the 10th to the 23rd (O.S.) of May 1692, between an allied British and Dutch fleet and a French force, on the northern and eastern sides of the Cotentin in Normandy. A body of French troops, and a number of Jacobite exiles, had been collected in the Cotentin. The government of Louis XIV. prepared a naval armament to cover their passage across the Channel. This force was to have been composed of the French ships at Brest commanded by the count of Tourville, and of a squadron which was to have joined from Toulon. But the Toulon ships were scattered by a gale, and the combination was not effected. The count of Tourville, who had put to sea to meet them, had with him only 45 or 50 vessels, and when the French Government failed to join him, he steered up Channel to meet the allies, who were known to be in strength. On the 15th of May the British fleet of 63 sail of the line, under command of Edward Russell, afterwards earl of Orford, was joined at St Helens by the Dutch squadron of 36 sail under Admiral van Allemonde. The apparent rashness of the French admiral in seeking an encounter with very superior numbers is explained by the existence of a general belief that many British captains were discontented, and would pass over from the service of the government established by the Revolution of 1688 to their exiled king, James II. It is said that Tourville had orders from Louis XIV. to attack in any case, but the story is of doubtful authority. The British government, aware of the Jacobite intrigues in its fleet, and of the prevalence of discontent, took the bold course of appealing to the loyalty and patriotism of its officers. At a meeting of the flag-officers on board the "Britannia," Russell's flag-ship, on the 15th of May, they protested their loyalty, and the whole allied fleet put to sea on the 18th. On the 19th of May, when Cape Barfleur, the
north-eastern point of the Cotentin, was 21 m. S.W. of them, they sighted Tournville, who was then 20 m. to the north of Cape La Hague, the north-western extremity of the peninsula, which must not be confounded with La Hogue, or La Hogue, the place at which the fighting ended. The allies were formed in a line from S.S.W. to N.N.E. heading towards the English coast, the Dutch forming the White or van division, while the Red or centre division under Russell, and the Blue or rear under Sir John Ashby, were wholly composed of British ships. The wind was from the S.W. and the weather hazy. Tournville bore down and attacked about mid-day, directing his main assault on the centre of the allies, but telling off some ships to watch the van and rear of his enemy. As this first encounter took place off Cape Barfleur, the battle was formerly called by the name. On the centre, where Tournville was directly opposed to Russell, the fighting was severe. The British flag-ship the "Britannia" (100), and the French, the "Soliel Royal" (100), were both completely crippled. After several hours of conflict, the French admiral, seeing himself outnumbered, and that the allies could outflank him and pass through the necessarily wide intervals in his extended line, drew off without the loss of a ship. The wind now fell and the haze became a fog. Till the 23rd, the two fleets remained off the north coast of the Cotentin, drifting west with the ebb tide or east with the flood, save when they anchored. During the night of the 19th/20th some British ships became entangled, in the fog, with the French, and drifted through them on the tide, with loss. On the 23rd both fleets were near La Hague. About half the French, under D'Amfreville, rounded the cape, and fled to St Malo through the dangerous passage known as the Race of Alderney (le Ras Blanchard). The others were unable to get round the cape before the tide set in, and were carried to the eastward. Tournville now transferred his own flag, and left his captains free to save themselves as they best could. He left the "Soliel Royal," and sent her with two others to Cherbourg, where they were destroyed by Sir Ralph Delaval. The others now ran round Cape Barfleur, and sought refuge on the east side of the Cotentin at the anchorage of La Hogue, called by the English La Hogue, where the troops destined for the invasion were encamped. Here 13 of them were burnt by Sir George Rooke, in the presence of the French generals and of the exiled king James II. From the name of the place where the last blow was struck, the battle has come to be known by the name of La Hogue.

Sufficient accounts of the battle may be found in Lebrat's Naval History (Paris, 1867), and for the French side in Tronde's Batailles navales de la France (Paris, 1867). The escape of D'Amfreville's squadron is the subject of Browning's poem "Hervé Riel."

LAHORE, an ancient city of British India, the capital of the Punjab, which gives its name to a district and division. It lies in 31° 35' N. and 74° 20' E. near the left bank of the River Ravi, 1706 ft. above the sea, and 1732 m. by rail from Calcutta. It is thus in about the same latitude as Cairo, but owing to its inland position is considerably hotter than that city, being one of the hottest places in India in the summer time. In the cold season the climate is pleasantly cool and bright. The native city is walled, about 1½ m. in length W. to E. and about ½ m. in breadth N. to S. Its site has been occupied from early times, and much of it stands high above the level of the surrounding country, raised on the remains of a succession of former habitations. Some old buildings, which have been preserved, stand now below the present surface of the ground. This is well seen in the mosque now called Masjid Niwin (or sunken) built in 1560, and the mosque of Mullah Rahmat, 7 ft. below, and the Shivali, a very old Hindu temple, 10 ft. below the surface of the ground. Hindu tradition traces the origin of Lahore to Loh or Lava, son of Rama, the hero of the Ramayana. The absence of mention of Lahore by Alexander's historians, and the fact that coins of the Graeco-Bactrian kings are not found among the ruins, lead to the belief that it was not a place of any importance during the earliest period of Indian history. On the other hand, Hsüan Tsang, the Chinese Buddhist, notices the city in his Itinerary (A.D. 630); and it seems probable, therefore, that Lahore first rose into prominence between the 1st and 2nd centuries A.D. Governed originally by a family of Chauhan Rajputs, a branch of the house of Ajmer, Lahore fell successively under the dominion of the Ghazni and Ghori sultans, who made it the capital of their Indian conquests, and adorned it with numerous buildings, almost all now in ruins. But it was under the Mogul empire that Lahore reached its greatest size and magnificence. The reigns of Humayun, Akbar, Jahangir, Shah Jahan and Aurangzeb form the golden period in the annals and architecture of the city. Akbar enlarged and repaired the fort, and surrounded the town with a wall, portions of which remain, built into the modern work of Ranjit Singh. Lahore formed the capital of the Sikh empire of that monarch. At the end of the second Sikh War, with the rest of the Punjab, it came under the British dominion.

The architecture of Lahore cannot compare with that of Delhi. Jahangir in 1622–1627 erected the Khwabgah or "sleeping-place," a fine palace much defaced by the Sikhs but to some extent restored in modern times; the Moti Masjid or "pearl mosque" in the fort, used by Ranjit Singh and afterwards by the British as a treasury-house; and also the tomb of Anarkali, used formerly as the station church and now as a library. Shah Jahan erected a palace and other buildings near the Khwabgah, including the beautiful pavilion called the Naulakha from its cost of nine lakhs, which was inlaid with precious stones. The mosque of Wazir Khan (1634) provides the finest example of kashi or encaustic tile work. Aurangzeb's Jama Masjid, or "great mosque," is a huge bare building, stiff in design, and lacking the detailed ornament typical of buildings at Delhi. The buildings of Ranjit Singh, especially his mausoleum, are common and meretricious in style. He was, moreover, responsible for much of the despoiling of the earlier buildings. The streets of the native city are narrow and tortuous, and are best seen from the back of an elephant. Two of the chief features of Lahore lie outside its walls at Shahdara and Shalamar Gardens respectively. Shahdara, which contains the tomb of the emperor Jahangir, lies across the Ravi some 6 m. N. of the city. It consists of a splendid marble cenotaph surrounded by a grove of trees and gardens. The Shalamar Gardens, which were laid out in a.d. 1637 by Shah Jahan, lie 6 m. E. of the city. They are somewhat neglected except on festive occasions, when the fountains are playing and the trees are lit up by lamps at night.

The modern city of Lahore, which contained a population of 202,664 in 1901, may be divided into four parts: the native city, already described; the civil station or European quarter, known as "Old Lahore," the Anarkali bazaar, a square of S. of the city wall; and the cantonment, formerly called Miani Mir. The main street of the civil station is a portion of the grand trunk road from Calcutta to Peshawar, locally known as the Mall. The chief modern buildings along this road, west to east, are the Lahore museum, containing a fine collection of Graeco-Buddhist sculptures, found by General Cunningham in the Yusufzai country, and arranged by Mr Lockwood Kipling, a former curator of the museum; the cathedral, begun by Bishop French, in Early English style, and consecrated in 1887; the Lawrence Gardens and Montgomery Halls, surrounded by a garden that forms the chief meeting-place of Europeans in the afternoon; and opposite this government house, the official residence of the lieutenant-governor of the Punjab; next to this is the Punjab club for military men and civilians. Three miles beyond is the Lahore cantonment, where the garrison is stationed, except a company of British infantry, which occupies the fort. It is the headquarters of the 3rd division of the northern army. Lahore is an important junction on the North-Western railway system, but has little local trade or manufacture. The chief industries are silk goods, gold and silver lace, metal work and carpets which are made in the Lahore gaol. There are also cotton mills, flour mills, an ice-factory, and several factories for mineral waters, oils, soap, leather goods, &c. Lahore is an important educational centre. Here are the Punjab University with five colleges, medical and law colleges, a central training
college, the Aitchison Chieft's College for the sons of native noblemen, and a number of other high schools and technical and special schools.

The District of Lahore has an area of 3704 sq. m., and its population in 1901 was 1,624,109, consisting chiefly of Punjabi Mahomedans with a large admixture of Hindus and Sikhs. In the north-west the district includes a large part of the barren Rechna Doab, while south of the Ravi is a desolate alluvial tract, liable to floods. The Manjha plateau, however, between the Ravi and the Beas, has been rendered fertile by the Bar Doab canal. The principal crops are wheat, pulse, millets, maize, oil-seeds and cotton. There are numerous factories for ginning and pressing cotton. Irrigation is provided by the main line of the Bar Doab canal and its branches, and by inundation-cuts from the Sutlej. The district is crossed in several directions by lines of the North-Western railway. Lahore, Kasur, Chillianwala and Raviwind are the chief trade centres.

The influx in the suburbs. Lahore, Kasur, Chillianwala and Raviwind are the chief trade centres.

The city of Lahore is situated on a plain near the junction of the rivers Ravi and Sutlej. It is a considerable trading centre, and has a population of about 250,000. It is the capital of the Lahore district, and is situated in the north-western part of the Punjab, on the Jhelum, a tributary of the Jumna. The city is surrounded by a wall, and is defended by a moat. The chief public buildings are the palace of the Viceregal Resident, the secretariat, theCustom House, the Museum, and the Legislative Assembly. The city is also noted for its fine gardens, which are open to the public.

Laibach is supposed to occupy the site of the ancient Emona or Aenoma, founded by the emperor Augustus in 24 B.C. It was besieged by Alaric in 400, and in 451 it was desolated by the Huns. In 1914 it was occupied by the Austro-Hungarian army, and in 1899 by the Serbs.

LAIBACH. (Slovenian, Ljubljana), capital of the Austrian duchy of Carniola, 237 m. S.S.W. of Vienna by rail. Pop. (1900) 36,547, mostly Slovene. It is situated on the Ljubljanica, near its influx into the Save, and consists of the town proper and eight suburbs. Laibach is an episcopal see, and possesses a cathedral in the Italian style, several beautiful churches, a town hall in Renaissance style and a castle, built in the 15th century, on the Schlossberg, an eminence which commands the town. Laibach is the principal centre of the national Slovene movement, and it contains a Slovene theatre and several societies for the promotion of science and literature in the native tongue. The Slovenian language is in general official use, and the municipal administration is purely Slovenian. The industries include manufactures of pottery, bricks, oil, linen and woollen cloth, fire-hose and paper.

Laibach is supposed to occupy the site of the ancient Emona or Aenoma, founded by the emperor Augustus in 24 B.C. It was besieged by Alaric in 400, and in 451 it was desolated by the Huns. In 1914 it was occupied by the Austro-Hungarian army, and in 1899 by the Serbs.
8th of December, in order that he might be free to act as “mediator between his erring peoples and the states whose tranquillity they threatened.” The cynical use he made of his “freedom” to repudiate obligations solemnly contracted is described elsewhere (see NAPLES, History). The result of this action was the Neapolitan declaration of war and the occupation of Naples by Austria, with the sanction of the congress. This was preceded, on the 10th of March, by the revolt of the garrison of Alessandria and the military revolution in Piedmont, which in its turn was suppressed, as a result of negotiations at Laibach, by Austrian troops. It was at Laibach, too, that, on the 19th of March, the emperor Alexander received the news of Ypsilanti’s invasion of the Danubian principalities, which heralded the outbreak of the War of Greek Independence, and from Laibach Capo d’Istria addressed to the Greek leader the tsar’s repudiation of his action.

The conference closed on the 12th of May, on which date Russia, Austria and Prussia issued a declaration (Hertsfel, No. 108) “to proclaim to the world the principles which guided them” in coming “to the assistance of subdued peoples,” a declaration which once more affirmed the principles of the Trouppe Protocol. In this lay the European significance of the Laibach conference, of which the activities had been mainly confined to Italy. The issue of the declaration without the signatures of the representatives of Great Britain and France proclaimed the disunion of the alliance, within which—to use Lord Stewart’s words—there existed “a triple understanding in which the parties carry forward their own views in spite of any difference of opinion between them and the two great constitutional governments.”

No separate history of the congress exists, but innumerable references are to be found in general histories and in memoirs, correspondence, &c., of the time. Sir William Stewart, M.P. for Europe, London, 1873; Sir Charles Metternich, Memoirs; N. Bianchi, Storia documentata della diplomazia Europea in Italia (8 vols., Turin, 1865-1872); Gentz’s correspondence (see GENTZ, F. von). Valuable unpublished correspondence is preserved at the Registry Office. The volumes marked F. O., Austria, Lord Stewart, January to February 1821, and March to September 1821. (W. A. P.)

LAIDLOW, WILLIAM (1780-1825), friend and amanuensis of Sir Walter Scott, was born at Blackhouse, Selkirkshire, on the 19th of November 1780, the son of a sheep farmer. After an elementary education in Peebles he returned to work upon his father’s farm. James Hogg, the shepherd poet, who was employed at Blackhouse for some years, became Laidlaw’s friend and appreciative critic. Together they assisted Scott by supplying material for his Border Minstrelsy, and Laidlaw, after two failures as a farmer in Midlothian and Peebleshire, became Scott’s steward at Abbotsford. He also acted as Scott’s amanuensis at different times, taking down a large part of The Bride of Lammermoor, The Legend of Montrose and Ivanhoe from the author’s dictation. He died at Contin near Dingwall, Ross-shire, on the 18th of May 1845. Of his poetry, little is known.

LAING, ALEXANDER GORDON (1793-1826), Scottish explorer, the first European to reach Timbuktu, was born at Edinburgh on the 27th of December 1793. He was educated by his father, William Laing, a private teacher of classics, and at Edinburgh University. In 1811 he went to Barbados as clerk to his maternal uncle Colonel (afterwards General) Gabriel Gordon. Through General Sir George Beckwith, governor of Barbados, he obtained an ensigncy in the York Light Infantry. He was employed in the West Indies, and in 1822 was promoted to a company in the Royal African Corps. In that year, while with his regiment at Sierra Leone, he was sent by the governor, Sir Charles MacCarthy, to the Mandingo country, with the double object of opening up commerce and endeavouring to abolish the slave trade in that region. Later in the same year Laing visited Falaba, the capital of the Sulima country, and ascertained the source of the Rokell. He endeavoured to reach the source of the Niger, but was stopped by the natives. He was, however, enabled to fix it with approximate accuracy. He took an active part in the Ashanti War of 1821-24, and was sent home with the despatches containing the news of the death of action in Sir Charles MacCarthy. Henry, 3rd Earl Bathurst, then secretary for the colonies, instructed Captain Laing to undertake a journey, via Tripoli and Timbuktu, to further elucidate the hydrography of the Niger basin. Laing left England in February 1825, and at Tripoli on the 14th of July following he married Emma Warrington, daughter of the British consul. Two days later, leaving his bride behind, he started to cross the Sahara, being accompanied by a sheikh who was subsequently accused of planning his murder. Ghadames was reached, by an indirect route, in October 1825, and in December Laing was in the Tuat territory, where he was well received by the Tuareg. On the 10th of January 1826 he left Tuat, and made for Timbuktu across the desert of Tanezzroft. Letters from him written in May and July following told of sufferings from fever and the plundering of his caravan by Tuareg, Laing being wounded in twenty-four places in the fighting. Another letter dated from Timbuktu on the 21st of September announced his arrival in that city on the preceding 18th of August, and the insecurity of his position owing to the hostility of the Fula chiefain Bello, then ruling the city. He added that he intended leaving Timbuktu in three days’ time. No further news was received from the traveller. From native information it was ascertained that he left Timbuktu on the day he had planned and was murdered on the night of the 26th of September 1826. His papers were never recovered, though it is believed that they were secretly brought to Tripoli in 1828. In 1903 the French government placed a tablet bearing the name of the explorer and the date of his visit on the house occupied by him during his thirty-eight days’ stay in Timbuktu.

While in England in 1824 Laing prepared a narrative of his earlier journeys which was published in 1825 and entitled Travels in the Timannee, Kooranko and Soolomia Countries, in Western Africa.

LAING, DAVID (1793-1878), Scottish antiquary, the son of William Laing, a bookseller in Edinburgh, was born in that city on the 20th of April 1793. Educated at the Canongate Grammar School, where fourteen he was apprenticed to his father. Shortly after the death of the latter in 1837, Laing was elected to the librarianship of the Signet Library, which position he retained till his death. Apart from an extraordinary general bibliographical knowledge, Laing was best known as a lifelong student of the literary and artistic history of Scotland. He published no original volumes, but contented himself with editing the works of others. Of these, the chief are—Dunbar’s Works (2 vols., 1834), with a supplement (2 vols., 1848); W. Scott’s Poems and Journal (3 vols., 1847-1842); John Knox’s Works (6 vols., 1846-1846); Poems and Fables of Robert Henryson (1865); Andrew of Wymot’s Orygynale Cronykil of Scotland (3 vols., 1872-1879); Sir David Lyndsay’s Poetical Works (3 vols., 1879). Laing was for more than fifty years a member of the Society of Antiquaries of Scotland, and he contributed upwards of a hundred separate papers to their Proceedings. He was also for more than forty years secretary to the Bannatyne Club, many of the publications of which were edited by him. He was struck with paralysis in 1878 while in the Signet Library, and it is related that, on recovering consciousness, he looked about and asked if a proof of Wymot had been sent from the printers. He died a few days afterwards, on the 18th of October, in his eighty-sixth year. His library was sold by auction, and realised £16,157. To the university of Edinburgh he bequeathed his collection of MSS.

See the Biographical Memoir prefixed to Select Remains of Ancient, Popular and Romance Poetry of Scotland, edited by John Small (Edinburgh, 1885); also T. G. Stevenson, Notices of David Laing with List of his Publications, etc. (privately printed 1878).

LAING, MALCOLM (1762-1818), Scottish historian, son of Robert Laing, and elder brother of Samuel Laing the elder, was born on his paternal estate on the Mainland of Orkney. Having left at the grammar school of Kirkwall and at Edinburgh University, he was called to the Scottish bar in 1783, but devoted his time mainly to historical studies. In 1793 he completed the sixth and last volume of Robert Henry’s History of Great Britain, the portion which he wrote being in its strongly
LAING, S.—LAISANT

liberal tone at variance with the preceding part of the work; and in 1802 published his History of Scotland from the Union of the Crowns to the Union of the Kingdoms, a work showing considerable research. Attached to the History was a dissertation on the Gowrie conspiracy, and another on the supposed authenticity of Ossian’s poems. In another dissertation, prefixed to a second and corrected edition of the History published in 1804, Laing endeavoured to prove that Mary, queen of Scots, wrote the Casket Letters, and was partly responsible for the murder of Lord Darnley. In the same year he edited the Life and Historie of King James VI., and in 1805 brought out in two volumes an edition of Ossian’s poems. Laing, who was a friend of Charles James Fox, was member of parliament for Orkney and Shetland from 1807 to 1812. He died on the 6th of November 1818.

LAING, SAMUEL (1810-1897), British author and railway administrator, was born at Edinburgh on the 12th of December 1810. He was the nephew of Malcolm Laing, the historian of Scotland; and his father, Samuel Laing (1780-1868), was also a well-known author, whose books on Norway and Sweden attracted much attention. Samuel Laing the younger entered St John’s-College, Cambridge, in 1827, and after graduating as second wrangler and Smith’s prizeman, was elected a fellow, and remained at Cambridge until 1832, when he was called to the bar in 1837, and became private secretary to Mr. Labouchere (afterwards Lord Taunton), the president of the Board of Trade. In 1842 he was made secretary to the railway department, and retained this post till 1847. He had by then become an authority on railway working, and had been a member of the Dalhousie Railway Commission; it was at his suggestion that the “parliamentary” rate of a penny a mile was instituted. In 1848 he was appointed chairman and managing director of the London, Brighton & South Coast Railway, and his business faculty showed itself in the largely increased prosperity of the line. He also became chairman (1852) of the Crystal Palace Company, but retired from both posts in 1855. In 1852 he entered parliament as a Liberal for Wick, and after losing his seat in 1857, was re-elected in 1859, in which year he was appointed financial secretary to the Treasury; in 1860 he was made finance minister in India. On returning from India, he was re-elected for Wick in 1865. He was defeated in 1868, but in 1873 he was returned for Orkney and Shetland, and retained his seat till 1885. Meanwhile he had been re-appointed chairman of the Brighton line in 1867, and in 1873, when the railway was largely owned by Admiralty, Laing was made chairman. He was also chairman of the Railway Debenunter Trust and the Railway Share Trust. In later life he became well known as an author, his Modern Science and Modern Thought (1885), Problems of the Future (1889) and Human Origins (1892) being widely read, not only by reason of the writer’s influential position, experience of affairs and clear style, but also through their popular and at the same time well-informed treatment of the scientific problems of the day. Laing died at Sydenham on the 6th of August 1897.

LAING’S [or LANG’S] NEK, a pass through the Drakensberg, South Africa, immediately north of Majuba (q.v.), at an elevation of 5400 to 6000 ft. It is the lowest part of a ridge which slopes from Majuba to the Buffalo river, and before the opening of the railway in 1891 the road over the nek was the main artery of communication between Durban and Pretoria. The railway pierces the nek by a tunnel 2213 ft. long. When the Boers rose in revolt in December 1880 they occupied Laing’s Nek to oppose the entry of British reinforcements into the Transvaal. On the 28th of January 1881 a small British force endeavoured to pass the Boers from the northern slopes, but was forced to retire. LAIRD, MACGREGOR (1808-1861), Scottish merchant, pioneer of British trade on the Niger, was born at Greenock in 1808, the younger son of William Laird, founder of the Birkenhead firm of shipbuilders of that name. In 1831 Laird and certain Liverpool merchants formed a company for the commercial development of the Niger regions, the lower course of the Niger having been made known that year by Richard and John Lander. In 1832 the company despatched two small ships to the Niger, one, the “Alburkah,” a paddle-wheel steamer of 55 tons designed by Laird, being the first iron vessel to make an ocean voyage. Macgregor Laird went with the expedition, which was led by Richard Lander and numbered forty-eight Europeans, of whom all but nine died from fever or, in the case of Lander, from wounds. Laird went up the Niger to the confluence of the Benue (then called the Shary or Tchadda), which he was the first white man to ascend. He did not go far up the river but formed an accurate idea as to its source and course. The expedition returned to Liverpool in 1834, Laird and Surgeon R. A. K. Oldfield being the only surviving officers besides Captain (then Lieut.) William Allen, R.N., who accompanied the expedition by order of the Admiralty to survey the river. Laird and Oldfield published in 1837 in two volumes the Narrative of an Expedition into the Interior of Africa by the River Niger . . ., in 1832, 1833, 1834. Commercially the expedition had been unsuccessful, but Laird had gained experience invaluable to his successors. He never returned to Africa but henceforth devoted himself largely to the development of trade with West Africa and especially to the opening up of the countries now forming the British protectorates of Nigeria. One of his principal reasons for so doing was the belief that this method was the best for stopping the slave trade and raising the social condition of the Africans. In 1854 he sent out at his own charges, but with the support of the British government, a small steamer, the “Pleiad,” which under W. B. Baikie made so successful a voyage that Laird induced the government to sign contracts for annual trading trips by steamers specially built for navigation of the Niger and Benue. Various stations were founded on the Niger, and though government support was withdrawn after the death of Laird and Baikie, British traders continued to frequent the river, which Laird had opened up with little or no personal advantage. Laird’s interests were not, however, wholly African. In 1837 he was one of the promoters of a company formed to run steamships between England and New York, and in 1838 the “Sirius,” sent out by this company, was the first ship to cross the Atlantic from Europe entirely under steam. Laird died in London on the 9th of January 1861.

LAIRD’s brother, JOHN LAIRD (1805-1874), was one of the first to use iron in the construction of ships; in 1839 he made an iron lighter of 60 tons which was used on canals and lakes in Ireland; in 1834 he built the paddle steamer “John Randolph” for Savannah, U.S.A. intended to be the first ship built in America. For the East India Company he built in 1839 the first iron vessel carrying guns and he was also the designer of the famous “Birkenhead.” A Conservative in politics, he represented Birkenhead in the House of Commons from 1861 to his death.

LAISANT, the name of two Greek courtiers, generally distinguished as follows. (1) The elder, a native of Corinth, born c. 480 B.C., was famous for her greed and heartlessness, which gained her the nickname of Aixinè (the axe). Among her lovers were the philosophers Aristippus and Diogenes, and Eubatas (or Aristoteles) of Cyrene, a famous runner. In her old age she became a drunkard. Her grave was shown in the Cranocean near Corinth, surmounted by a lioness tearing a ram. (2) The younger, daughter of Timandra the mistress of Alcibiades, born at Hyccara in Sicily c. 420 B.C., taken to Corinth during the Sicilian expedition. The painter Apelles, who saw her drawing water from the fountain of Peirene, was struck by her beauty, and took her as a model. Having followed a handsome Thessalian to his native land, she was slain in the temple of Aphrodite by a madman, who having seen her, was seized by an overwhelming passion for her. Accounts are told of a Laís by Athenaeanus, Aelian, Pausanias, and she forms the subject of many epigrams in the Greek Anthology; but, owing to the similarity of names, there is considerable uncertainty to whom they refer. The name itself, like Phryne, was used as a general term for a courtesan. See F. Jacobs, Vermischte Schriften, iv. (1830).

LAISANT, CHARLES ANNE (1841— ), French politician, was born at Nantes on the 1st of November 1841, and was educated at the École Polytechnique as a military engineer.
He defended the fort of Issy at the siege of Paris, and served in Corsica and in Algeria in 1837. In 1876 he resigned his commission to enter the Chamber as deputy for Nantes in the republican interest, and in 1879 he became director of the Petit Parisien. For alleged libel on General Court de Cissey in this capacity he was imprisoned briefly. He then becameAttached to a committee appointed to consider army legislation, resigning in 1887 on the refusal of the Chamber to sanction the abolition of exemptions of any kind. He then became an adherent of the revisionist policy of General Boulanger and a member of the League of Patriots. He was elected Boulangist deputy for the 18th Parisian arrondissement in 1889. He did not seek re-election in 1893, but devoted himself thenceforward to mathematics, helping to make known in France the theorems of Giusto Bellavitis. He was attached to the staff of the École Polytechnique, and in 1903-1904 was president of the French Association for the Advancement of Science.

In addition to his political pamphlets Pourquoi et comment je suis Boulangiste (1887) and L’Anarchie bourgeoise (1887), he published mathematical works, among them Introduction à l’étude des quart-érons (1881) and Théorie et applications des équidistances (1887).

LAI-YANG, a city in the Chinese province of Shan-tung, in 37° N., 120° 55’ E., about the middle of the eastern peninsula, on the highway running south from Chi-fu to Kin-Kia or Tientsin harbour. It is surrounded by well-kept walls of great antiquity, and its main streets are spanned by large poutous or monumental arches, some dating from the time of the emperor Tai-ting-ti of the Yuan dynasty (1324). There are extensive suburbs both to the north and south, and the total population is estimated at 50,000. The so-called Ailanthus silk produced by Saturnia cynthia is woven at Lai-yang into a strong fabric; and the manufacture of the peculiar kind of wax obtained from the la-shu or wax-tree insect is largely carried on in the vicinity.

Lakanal, Joseph (1762-1843), French politician, was born at Serres (Ariège) on the 14th of July 1762. His name, originally Lacanal, was altered to distinguish him from his Royalist brothers. He joined one of the teaching congregations, and for fourteen years taught in the schools. He was elected by his native department to the Convention in 1792 he was acting vicar to his uncle Bernard Font (1723-1800), the constitutional bishop of Pamiers. In the Convention he held apart from the various party sections, although he voted for the death of Louis XVI. He rendered great service to the Revolution by his practical knowledge of education. He became a member of the Committee of Public Instruction early in 1793, and after carrying many useful decrees on the preservation of national monuments, on the military schools, on the reorganization of the Museum of Natural History and other matters, he brought forward on the 26th of June his Projet d’éducation nationale (printed at the Imprimerie Nationale), which proposed to lay the burden of primary education on the public funds, but to leave secondary education to private enterprise. Provision was also made for public festivals, and a central commission was to be instituted to superintend subscription lists. As far as can be seen the system in France remained the same after the fall of Robespierre. The system was rejected by the Convention, Constance, who submitted the whole question to a special commission of six, which under the influence of Robespierre adopted a report by Michel le Peletier de Saint Fargeau shortly before his tragic death. Lakanal, who was a member of the commission, now began to work for the organization of higher education, and abandoning the principle of his Projet advocated the establishment of state-aided schools for primary, secondary and university education. In October 1793 he was sent by the Convention to the south-western departments and did not return to Paris until after the revolution of Thermidor. He now became President of the Education Committee and promptly abolished the system which had had Robespierre’s support. He drew up schemes for departmental normal schools, for primary schools (reviving in substance the Projet) and central schools. He presently acquiesced in the supersession of his own system, but continued his educational reports after his election to the Council of the Five Hundred. In 1799 he was sent by the Directory to organize the defence of the four departments on the left bank of the Rhine threatened by invasion. Under the Consulate he resumed his professional work, and after Waterloo retired to America, where he became president of the university of Louisiana. Shortly afterwards, in spite of his advanced age, married a second time. He died in Paris on the 14th of February 1845; his widow survived till 1881. Lakanal was an original member of the Institute of France. He published in 1838 an Exposé sommaire des travaux de Joseph Lakanal.

His idole at the Academy of Moral and Political Science, of which he was a member, was pronounced by the comte de Rémusat (February 16, 1843), and a Notice historique by F. A. Mignet was read on the 2nd of May 1857. See also notices by Émile Durand (Paris, 1874), “Marcus” (Paris, 1879), P. Legende in Hommes de la révolution (Paris, 1882), E. Guillon, Lakanal et l'instruction publique (Paris, 1881). For details of the reports submitted by him to the Department of Lower-Garonne, see the Histoire de l'instruction publique, actes et délibérations de la convention, &c. in Biblio. de l'histoire de Paris (vol. iii., 1900); also A. Robert and G. Cougy, Dictionnaire des parlementaires (vol. ii., 1890).

Lake, Gerard, 1st Viscount (1741-1808), British politician, was born on the 27th of July 1744. He entered the foot guards in 1758, becoming lieutenant (in the army) 1762, captain (lieut.-colonel) in 1776, major 1784, and lieut.-colonel in 1792, by which time he was a general officer in the army. He served with his regiment in Germany in 1760-1762 and with a composite battalion in the Yorktown campaign of 1781. After this he was equerry to the prince of Wales, afterwards George IV. In 1790 he became a major-general, and in 1793 was appointed to command the Guards Brigade in the duke of York's army in Flanders. He was in command at the brilliant affair of Lincelles, on the 18th of August 1793, and served on the continent (except for a short time when seriously ill) until April 1794. He had now sold his lieut.-colonelcy in the guards, and had become colonel of the 33rd foot and governor of Limerick. In 1797 he was promoted lieut.-general. In the following year the Irish rebellion broke out. Lake, who was then serving in the West Indies under Sir Ralph G. Abercromby in command of the troops in April 1798, issued a proclamation ordering the surrender of all arms by the civil population of Ulster, and on the 21st of June routed the rebels at Vinegar Hill (near Enniscorthy, Co. Wexford). He exercised great, but perhaps not unjustified, severity towards all rebels found in arms. Lord Cornwallis now assumed the chief command in Ireland, and in August sent Lake to oppose the French expedition which landed at Killala Bay. On the 29th of the same month Lake arrived at Castlebar, but only in time to witness the disgraceful rout of the troops under General Hely-Hutchinson (afterwards 2nd earl of Donoughmore); but he retrieved this disaster by compelling the surrender of the French at Ballinamuck, near Cloone, on the 8th of September. In 1799 Lake returned to England, and soon afterwards obtained the command in chief in India. He took over his duties at Calcutta in July 1801, and applied himself to the improvement of the Indian army, especially in the direction of making it more homogeneous, mobile and more manageable. In 1802 he was made a full general.

On the outbreak of war with the Maharatta confederacy in 1803 General Lake took the field against Sindhia, and within two months defeated the Maharrattas at Coel, stormed Aligah, took Delhi and Agra, and won the great victory of Laswari (November 1st, 1803), where the power of Sindhia was completely broken, with the loss of thirty-one disciplined battalions, trained and officered by Frenchmen, and 426 pieces of ordnance. This defeat, followed a few days later by Major-General Arthur Wellesley’s victory at Argaum, compelled Sindhia to come to terms, and a treaty with him was signed in December 1803. Operations were, however, continued against his confederate, Holkar, who, on the 17th of November 1804, was defeated by Lake at Farrukhabad. But the fortress of Bhurtpore held out against four assaults early in 1805, and Cornwallis, who succeeded Wellesley as governor-general in July of that year—superseding Lake at the same time as commander-in-chief—determined
to put an end to the war. But after the death of Cornwallis in October of the same year, Lake pursued Holkar into the Punjab and compelled him to surrender at Amritsar in December 1803. Wellesley in a despatch attributed much of the success of the war to Lake’s "matchless energy, ability and valour." For his services Lake received the thanks of parliament, and was rewarded by a peerage in September 1804. At the conclusion of the war he returned to England, and in 1807 he was created a viscount. He represented Aylesbury in the House of Commons from 1790 to 1802, and he also was brought into the Irish parliament by the government as member for Armagh in 1799 to vote for the Union. He died in London on the 2nd of February 1808.

See H. Pearse, Memoir of the Life and Services of Viscount Lake (London, 1908); G. B. Maileson, Descriptive Battles of India (1883); J. Corbett, and A. S. Grusky, Lake (1873); latest memoir in From Cromwell to Wellington, ed. Spenser Wilkinson.

LAKE. Professor Forel of Switzerland, the founder of the science of limnology (Gr. λίμως, a lake), defines a lake (Lat. latus) as a mass of still water situated in a depression of the ground, without direct communication with the sea. The term is sometimes applied to widened parts of rivers, and sometimes to bodies of water which lie along sea-coasts, even at sea-level and in direct communication with the sea. The terms pond, tarn, loch and mere are applied to smaller lakes according to size and position. Some lakes are so large that an observer cannot see low objects situated on the opposite shore, owing to the lake-surface assuming the general curvature of the earth’s surface. Lakes are nearly universally distributed, but are more abundant in high than in low latitudes. They are abundant in mountainous regions, especially those which have been recently glaciated. They are frequent along rivers which have low gradients, and fertile flats, where they are clearly connected with the changing channel of the river. Land in proximity to the sea, especially in wet climates, have numerous lakes, as, for instance, Florida. Lakes may be either fresh or salt, according to the nature of the climate, some being much more salt than the sea itself. They occur in all altitudes; Lake Titicaca in South America is 12,500 ft. above sea-level, and Yellowstone Lake in the United States is 7741 ft. above the sea; on the other hand, the surface of the Caspian Sea is 86 ft., the Sea of Tiberias 682 ft. and the Dead Sea 1292 ft. below the level of the ocean.

The primary source of lake water is atmospheric precipitation, which may reach the lakes through rain, melting ice and snow, springs, rivers and immediate run-off from the land-surfaces. The surface of the earth, with which we are directly in touch, is composed of lithosphere, hydrosphere and atmosphere, and these interpenetrate. Lakes, rivers, the water-vapour of the atmosphere and the water of hydration of the lithosphere, must all be regarded as outlying portions of the hydrosphere, which is chiefly made up of the great oceans. Lakes may be compared to oceanic islands. Just as an oceanic island presents many peculiarities in its rocks, soil, fauna and flora, due to its isolation from the larger terrestrial masses, so does a lake present peculiarities and an individuality in its physical, chemical and biological features, owing to its position and separation from the waters of the great oceans.

Origin of Lakes.—From the geological point of view, lakes may be arranged into three groups: (A) Rock-lakes, (B) Barrier-lakes and (C) Organic lakes. The last are such as are formed by glaciers, to which they are often referred because of their size and mound-like appearance.

A. ROCK-LAKES have been formed in several ways:

1. By slow movements of the earth’s crust, during the formation of mountains; the Lake of Geneva in Switzerland and the Lake of Annecy, both are due to the subsidence of the Alps; on the other hand, Lakes Stefanie, Rudolf, Albert Nyanza, Tanganyika and Nyasa in Africa, and the Dead Sea in Asia Minor, are all believed to be in a rift or sunken valley.

2. By Subsidence of the earth’s crust due to the weight of the subterranean rocks. The two best-known examples are the Crater-lakes and the Lake of Issards.

3. By Subsidence due to Subterranean Channels and Caves in Lime-

stone Rocks.—When the rocks of great limestone surfaces or underground lakes fall in, they produce at the surface what are called limestone sinks. Lakes similar to these are also found in regions abounding in rock-salt deposits; the Jura range offers many such lakes.

Lake Erosion.—A. C. Ramsay has shown that innumerable lakes of the northern hemisphere do not lie in fissures produced by underground disturbances, nor in areas of subsidence, nor in synclinal folds of strata, but are the results of glacial erosion. Many of the great mountain lakes in Switzerland, the Great Lakes of the Highlands of Scotland, were, without doubt, what Sir Archibald Geikie calls glen-lakes, or true rock-basins, which have been filled up by sand and mud brought into them by their tributary streams.

1. By a Lake Erosion. These may be due to the following causes:

A. By a Landslide. There are many cases of lakes formed by a large soil slide, dipping towards the valley, rest on soft layers; the hard rocks slip into the valley after heavy rains, damming back the drainage, which then forms a barrier-lake. Many small lakes high up in the Alps and mountains are formed by a river being dammed back in this way.

2. By a Glacier.—In Alaska, in Scandinavia and in the Alps a glacier often bars the mouth of a tributary valley, the stream flowing therein is dammed back, and a lake is thus formed. The best-known example of this kind is the Märgelen Lake in the Alps, near the Great Aletsch Glacier. Lake Castain in Alaska is barred by the Malaspina Glacier; it is 2 or 3 m. long and 1 m. in width when at its highest level; it discharges through a tunnel 9 m. in length beneath the ice-cap. The famous Glacier du Rhône in Switzerland has produced successively terraces formed along the shores of a glacial lake during the waning glacial epoch. Lake Agassiz, which during the glacial period occupied the valley of the Red River, and of which the present Lake Winnipeg is a remnant, is a lake formed along the margin of two great ice-sheets. It is estimated to have been 700 m. in length and to have covered an area of 110,000 sq. m., thus exceeding the total area of the five great North American lakes: Superior, 31,200, Michigan, 22,450, Huron with Georgian Bay (23,300), Erie (9960) and Ontario (19,750).

3. By the Lateral Moraine of an Actual Glacier.—These lakes sometimes occur in the Alps of Central Europe and in the Pyrenees Mountains.

4. By the Frontal Moraine of an Ancient Glacier.—The barrier in this case consists of the last moraine left by the retreating glacier. Such lakes are abundant in the northern hemisphere, especially in Scotland and the Alps.

5. By Submergence.—These lakes are formed by water, which once occupied a coastal region, now being submerged by the sea, the sea-level rising during the historic time. Many of the lakes of New England, especially, are of this class, the so-called stadial lakes.

6. By Sand Drifted into Dunes.—It is a well-known fact that sand may be carried across a desert by the wind, and eventually be deposited by it. When the wind is strong and the sand sufficiently fine to be blown in suspension, it may be the cause of the formation of lakes. The sand-dunes of the Sahara are formed in this way, and the sand-lakes which are formed from these sand-dunes is a case of secondary lake formation. Many of the lakes of the interior of the United States, especially those of the Great Lakes region, have been formed in this way, and the sand-dunes of the Great Darke Lakes region may be counted by tens of thousands, varying from the size of a tarn to that of the great Laurentian lakes above mentioned.

7. By Alluvial Barrier formed by Lateral Streams.—If the current of a main river be not powerful enough to sweep away detrital matter brought down by a lateral stream, a dam is formed causing a lake. These lakes are frequently met with in the narrow valleys of the Highlands of Scotland.

8. By Flows of Lava.—Lakes of this kind are met with in volcanic regions.

C. ORGANIC LAKES. In the vast tundras that skirt the Arctic Ocean in both the old and the new world, a great number of frozen ponds and lakes are met with, surrounded by banks of vegetation. Snow-basins are Generally accumulated during the season at the same spots. Due to the summer growth of the tundra vegetation, the snow-drifts are in fact melted at the same place, and the snow-drifts which last longest are surrounded by luxuriant vegetation. When such accumulations of snow, or rather ice, melt, the vegetation on the place they occupied is much less than the original growth, because the ice blocks the growth of plants more and more depressed, comparatively to the general surface, where vegetable growth is more abundant, and thus give origin to lakes. It is well known that in coral-reef regions small bays are cut off from the ocean by the growth of corals, and thus ultimately fresh-water basins are formed.

Life History of Lakes.—From the time of its formation a lake is destined to disappear. The historical period has not been long enough to enable man to have watched the birth, life and death of any single lake of considerable size, still by studying the
various stages of development a fairly good idea of the course they run can be obtained.

In humid regions two processes tend to the extinction of a lake, viz. the deposition of detrital matter in the lake, and the lowering of the lake by the cutting action of the outlet stream on the barrier. These outgoing streams, however, being very pure and clear, all detrital matter having been deposited in the lake, have less eroding power than inflowing streams. One of the best examples of the action of the filling-up process is presented by Lochs Doine, Voil and Lubnaig in the Callander district of Scotland. In post-glacial times these three lochs formed, without doubt, one continuous sheet of water, which subsequently became divided into three different basins by the deposition of sediment. Loch Doine has been separated from Loch Voil by alluvial cones laid down by two opposite streams. At the head of Loch Doine there is an alluvial flat that stretches for 13 m., formed by the Locharrig river and its tributaries. The long stretch of alluvium that separates Loch Voil from Loch Lubnaig has been laid down by Calair Burn in Glen Buckie, by the Kirkton Burn at Balquhidder, and by various streams on both sides of Strathycro. Loch Lubnaig once extended to a point 3 m. beyond its present outlet, the level of the loch being lowered about 20 ft. by the denuding action of the river Leny on its rocky barrier.

In arid regions, where the rainfall is often less than 10 ins. in the year, the action of winds in the transport of sand and dust is more in evidence than that of rivers, and the effects of evaporation are greater than that of precipitation. Salt and bitter lakes prevail in these regions. Many salt lakes, such as the Dead Sea and the Great Salt Lake, are descended from fresh-water ancestors, while others, like the Caspian and Aral Seas, are isolated portions of the ocean. Lakes of the first group have usually become salt through a decrease in the rainfall of the region in which they occur. The water begins to get salt when the evaporation from the lake exceeds the inflow. The inflowing waters bring in a small amount of saline and alkaline matter, which becomes more and more concentrated as the evaporation increases. In lakes of the second group the waters were salt at the outset. If inflow exceeds evaporation they become fresher, and may ultimately become quite fresh. If the evaporation exceeds the inflow they diminish in size, and their waters become more and more salt and bitter. The first lake which occupied the basin of the Great Salt Lake of Utah appears to have been fresh, then with a change of climate to have become a salt lake. Another change of climate taking place, the level of the lake rose until it overflowed, the outlet being by the Snake river; the lake then became fresh. This expanded lake has been called Lake Bonneville, which covered an area of about 17,000 sq. m. Another change of climate in the direction of aridity reduced the level of the lake below the level of the outlet, the waters became gradually salt, and the former fresh-water lake has been reduced gradually to the relatively small Great Salt Lake of the present day. The sites of extinct salt lakes yield interest in commercial quantities.

The Water of Lakes.—(a) Composition.—It is interesting to compare the quantity of solid matter in, and the chemical composition of, the water of fresh and salt lakes:—

This table embraces examples of several types of salt lakes. In the Koko-nor, Aral and open Caspian Sea we have examples of the moderately salt, non-saturated waters. In the Karabugas, a branch gulf of the Caspian, Urmia and the Dead Sea we have examples of saturated waters containing principally chlorides. Lake Van is an example of the alkaline seas which also occur in Egypt, Hungary and other countries. Their peculiarity consists in the quantity of carbonates of soda dissolved in their waters, which is collected by the inhabitants for domestic and commercial purposes.

The following analyses by Dr Bourcart give an idea of the chemical composition of the water of fresh-water lakes in grams per litre:—

LAKE EQUATION

(b) Movements and Temperature of Lake-Waters.—In addition to the rise and fall of the surface-level of lakes due to rainfall and evaporation, there is a transference of water due to the action of wind which results in raising the level at the end to which the wind is blowing. This effect is well marked in lakes which are exposed to the westerly winds. The surface-current produced by the wind transports a large quantity of warm water to the lee end of the loch, with the result that the surface of discontinuity is deeper at the lee than at the windward end. When the wind ceases, a temperature-seiche is started, just as an ordinary seiche is started in a basin of water which has been tilted. This temperature-seiche has been studied experimentally and rendered visible by superimposing a layer of paraffin on a layer of oil.

Welderburn estimates the quantity of heat that enters Loch Ness and is given out again during the year to be approximately sufficient to raise about 30,000 million gallons of water from freezing-point to boiling-point. Lakes thus make the climate in the region in which they occur, both by increasing its humidity and by decreasing its range of temperature. They cool and moisten the atmosphere by evaporation during summer, and when they freeze in winter a vast amount of latent heat is liberated, and moderates the fall of temperature.

Lakes act as reservoirs for water, and so tend to restrain floods, and to promote regularity of flow. They become sources of recreation, and provide water for selected purposes, such as the irrigation of the land which surrounds them. They have also been used for power, by means of the falling water when the lake is raised above the level of the river. The water-supply for towns and cities. In temperate regions small and shallow lakes are likely to freeze all over in winter, but deep lakes in the Scottish Highlands remain open. In February the temperature of the lake is much lower, and the low temperature of the air does not continue long enough to cool the whole body of water to the maximum density point. Deep lakes are thus the best sources of water-supply for cities, for in summer they supply relatively cool water and in winter relatively warmer water. Besides, the number of organisms in deep lakes is less than in small shallow lakes, in which there is a much higher temperature in summer, and consequently much greater organic growth. The deposits, which are formed along the shores and on the floor of the lake, depend on the geological structure and nature of the adjacent shores.

Biology.—Compared with the waters of the ocean those of lakes may safely be said to contain relatively few animals and plants. Whole groups of organisms—the Echinoderms, for instance—are unrepresented. In the oceans there is a much greater uniformity in the physical and chemical conditions than obtains in lakes. In lakes the temperature varies widely. To underground lakes light does not penetrate, and in these some of the organisms may be blind, for example, the blind crayfish (Camburus pellucidus) and the blind fish (Amblyopsis spelaeus) of the Kentucky caves. The majority of lakes are fresh, while some are so salt that no organisms have been found in them. The peaty matter in other lakes is so abundant that light does not penetrate to any great depth, and the humic acids in solution prevent the development of some species. Indeed, every lake has an individuality of its own, depending upon climate, size, nature of the bottom, chemical composition and condition and connexion with other lakes. While the ocean contains a great number of families and genera not represented in lakes, almost every genus in lakes is represented in the ocean.

The vertebrates, insects and flowering plants inhabiting lakes vary much according to latitude, altitude, and soil, and are well known to zoologists and botanists. The micro-flora and fauna have only recently been studied in detail, and we cannot yet be said to know much about tropical lakes in this respect. Mr James Murray, who has made a special study of the Scottish lakes, has made a list of 727 species (the fauna including 447 species, all invertebrates, and the flora comprising 277 species) belonging to the following groups; the list must not be regarded as in any way complete.

These organisms are found along the shores, in the deep waters, and in the surface waters of the lakes.

The littoral region is the most popular part of lakes; the existence of a rooted vegetation is only possible there, and this in turn supports a rich littoral fauna. The greater heat of the water along the margins also favours growth. The great majority of the species in Scottish lochs are met with in this region. Insect larvae of many kinds are found under stones or among woods. Most of the Cladocera, and the
the volume of water in the 360 Scottish lochs recently surveyed at 7 cu. m., and the approximate volume of water in all of the lakes of the world at about 2000 cu. m., so that this last number is but a small fraction of the volume of the ocean, which he previously estimated at 324 million cu. m. It may be recalled that the total rainfall on the land of the globe is estimated at 29,530 cu. m., and the total discharge from the rivers of the globe at 6524 cu. m.

Growth of oak, ash, magnolia, cypress and other valuable timber. The Watkins railway extending to the N.E. and the Kansas City Southern extending to the N.W. have opened up the very best of the forest. The country to the S. and W. is largely given over to rice culture. Lake Charles is the chief centre of lumber manufacture in the state, and has rice mills, car shops and an important trade in rice. Ten miles W. are sulphur mines (product in 1907 about 362,000 tons), which with those of Sicily produce a large part of the total product of the world. Jennings, about 34 m. to the E., is the centre of oil fields, once very productive but now of diminishing importance. Welsh, 23 m. E., is the centre of a newer field; and others lie to the N. Lake Charles was settled about 1872, largely by people from Iowa and neighbouring states, was incorporated as a town in 1857 under the name of Charleston and again in 1867 under its present name, and was chartered as a city in 1886. The city suffered severely by fire in April 1910.

**LAKE CITY**, a town and the county-seat of Columbia county, Florida, U.S.A., 59 m. by rail W. by S. of Jacksonville. Pop. (1900) 4013, of whom 2159 were negroes; (1905) 6903; (1910) 5032. Lake City is served by the Atlantic Coast Line, the Seaboard Air Line and the Georgia Southern & Florida railways. There are ten small lakes in the neighbourhood, and the town is a winter and health resort. It is the seat of Columbia College (Baptist, 1907); the Florida Agricultural College was opened here in 1883, became the university of Florida in 1903, and in 1905 abolished by the Buckman Law. Vegetables and fruits grown for the northern markets, sea-island cotton and tobacco are important products of the surrounding country, and Lake City has some trade in cotton, lumber, phosphates and turpentine. The town was first settled about 1826 as Alligator; it was incorporated in 1854; adopted the present name in 1859; and in 1901, with an enlarged area, was re-incorporated.

**LAKE DISTRICT**, in England, a district containing all the principal English lakes, and variously termed the Lake Country, Lakeland and “the Lakes.” It falls within the north-western counties of Cumberland, Westmorland and Lancashire (Furness district), about one-half being within the first of these. Although celebrated far outside the confines of Great Britain as a district of remarkable and strongly individual physical beauty, its area is only some 700 sq. m., a circle with radius of 15 m. from the central point covering practically the whole. Within this circle, besides the largest lake, Windermere, is the highest point in England, Scarfell Pike; yet Windermere is but 10½ m. in length, and covers an area of 5-69 sq. m., while Scarfell Pike is only 3201 ft. in height. But the lakes show a wonderful variety of character, from open expanses and steep rock-bound shores to picturesque island-groups and soft wooded banks; while the mountains have always a remarkable dignity, less from the profile of their summits than from the bold sweeping lines of their flanks, unbroken by vegetation, and often culminating in sheer cliffs or crags. At their feet, the flat green valley floors of the higher elevations give place in the lower parts to lovely woods. The streams are swift and clear, and numerous small waterfalls are characteristic of the district. To the north, west and south, a flat coastal belt, bordering the Irish Sea, with its inlets Morecambe Bay and Solway Firth, and broadest in the north, marks off the Lake District, while to the east the valleys of the Eden and the Lune divide it from the Pennine mountain system. Geologically, too, it is individual. Its centre is of volcanic rocks, complex in character, while the Coal-measures and New Red Sandstone appear round the edges. The district as a whole is grooved by a main depression, running from north to south, across the valleys of St John’s, Grasmere and Windermere, surmounting a pass (Dunmail Raise) of only 783 ft.; while a secondary depression, in the same direction, runs along Derwentwater, Borrowdale, Wasdale and Wastwater, but here Sty Head Pass, between Borrowdale and Wasdale, rises to 1600 ft. The centre of the 15-m. radius lies on the lesser heights between Langstrath and Dunmail Raise, which may, however, be the crown of an ancient dome of rocks, “the dissected skeleton of which, worn by the warfare of air and rain

and ice, now alone remains" (Dr. H. R. Mill, "Bathymetrical Survey of the English Lakes," Geographical Journal, vi. 48).

The principal features of the district may be indicated by following this circle round from north, by west, south and east.

The river Derwent (q.v.), rising in the tarns and "gills" or "ghills," possesses on its middle course, the wooded Borrowdale and forms Derwentwater and Bassenthwaite. These two lakes are in a class apart from all the rest, being broader for their length, and quite shallow (about 14 ft. average and 80 ft. maximum), as directed by the valley, narrow dots occupied by the other chief lakes, which average from 40 to 135 ft. deep. Derwentwater (q.v.), studded with many islands, is perhaps the most beautiful of all. Borrowdale is joined on the south side by the Derwent immediately below Derwentwater; the town of Keswick lying near the junction.

Derwentwater and Bassenthwaite occupy a single depression, a flat alluvial plain separating them. In Borrowdale a road traverses Honister Pass (1100 ft.), whence it descends westward, beneath the majestic Honister Crags, where green slate is quarried, into the valley containing Buttermere (94 ft. max. depth) and Crummock Water (144 ft.), drained by the Coaker. Between this and the Derwent valley the principal height is Grasmoor (2797 ft.), southward a steep narrow ridge (High Style, 2643) divides it from Ennerdale, containing Ennerdale Water (145 ft. max. depth), which is fed by the Liza and drained by the Eden. A splendid range separates this lake from Buttermere, and the highest is sparsely occupied by the large Gable (2949 ft.), Pillar (2927), with the precipitous Pillar Rock on the Ennerdale flank and Steele (2746). Wastdale, between Gable and the Scafell range, is peculiarly grand, with dark grey crags where the Tuva Beck descends. On the west side of the Scafell range is the fine detached rock, Napes Needle. Wastwater, 3 m. in length, is the deepest lake of all (258 ft.), its floor, like those of Windermere and Ullswater, sinking below sea-level. Its east shore is the river Duddon, the west shore is Wastwater. The range of Scafell (q.v.), its chief points being Scafell (3162 ft.), Scafell Pike (3210), Lingmell (2649) and Great End (2984), while the line is continued over Esk Hause Pass (2450) along a fine line of heights between Borrowdale and Newlands, the head of Derwentwater, and the English Eskdale. The line then descends to Wrynose Pass (1270 ft.), from which the Duddon runs south through a vale of peculiar richness in its lower parts; while the range continues south to culminate in the Old Man of Coniston (2333) with the splendid Dow Crag above Wast Water.

Goats Water. The pleasant vale of Yewdale drains south to Coniston Lake (51 m. long, 184 ft. max. depth), east of which a lower, wooded tract, containing two beautiful lesser lakes, Tarra Hows and Esthwaite Water, extends to Windermere (q.v.). This tract collects waters by the Brathay from Langdale, the head of which, between Bow Fell and Langdale Pikes (2401 ft.), is very fine; and by the Rothay from Dunmail Raise and the small lakes of Grasmere and Rydal. The Rothay is a rivulet joining the Crag, noted by Wordsworth in his English letters. German literature tells of several literary schools, or groups of writers inspired by the same ideas, and working in the spirit of the same principles and by the same poetic methods. The most celebrated are the so-called "Lake Poets," a group of English poets who lived in the vicinity of the English Lake District. Among these poets, whose works are known as the "Lake Poets," were Wordsworth, Southey, and Coleridge. Wordsworth's poetry is characterized by its close observation of nature and its focus on the human experience of the natural world. Southey's poetry is known for its romantic and imaginative qualities, while Coleridge's poetry is characterized by its exploration of the human mind and its relationship with the natural world.

See also WINDERMERE, ULLSWATER, ESKDALE, TARNES, GLADE DALE, RYDAL, CONISTON, PADDERTON, GRASMERE, INCANNA."
LAKE DWELLINGS

and consisting of a row of distinct dwellings. C. D. Cameron describes three villages thus built on piles in Lake Mohra, or Moira, in Central Africa, the motive here being to prevent surprise by bands of slave-catchers. Similar constructions have been described by travellers, among the Dyaks of Bornoe, in Celebes, in the Caroline Islands, on the Gold Coast of Africa, and in other places.

Hippocrates, writing in the 5th century B.C., says of the people of the Phasis that their country is hot and marshy and subject to frequent inundations, and that they live in houses of timber and reeds constructed in the midst of the waters, and use boats of a single tree trunk. Herodotus, writing also in the 5th century B.C., describes the people of Lake Prasias as living in houses constructed on platforms supported on piles in the middle of the lake, which are approached from the land by a single narrow bridge. Abulafia the geographer, writing in the 13th century, notices the fact that part of the Apamaean Lake was inhabited by Christian fishermen who lived on the lake in wooden huts built on piles, and Sir John Lubbock (Lord Avebury) mentions that the Rumelian fishermen on Lake Prasias "still inhabit wooden cottages built over the water, as in the time of Herodotus."

The records of the wars in Ireland in the 16th century show that the petty chieftains of that time had their defensive strongholds constructed on the "freshwater lakes" of the country, and they are of evidence of a similar system in the western parts of Scotland. The archaeological researches of the past fifty years have shown that such artificial constructions in lakes were used as defensive dwellings by the Celtic people from an early period to medieval times (see CRANNOG). Similar researches have also established the fact that in prehistoric times nearly all the lakes of Switzerland, and many in the adjoining countries—in Savoy and the north of Italy, in Austria and Hungary and in Mecklenburg and Pomerania—were peopled, so to speak, by lake-dwelling communities, living in villages constructed on platforms supported by piles at varying distances from the shores. The principal groups are those in the Lakes of Bourget, Geneva, Neuchâtel, Bienne, Zürich and Constance lying to the north of the Alps, and in the Lakes Maggiore, Varese, Iseo and Garda lying to the south of that mountain range. Many smaller lakes, however, contain them, and they are also found in peat moors on the sites of ancient lakes now drained or silted up, as at Laibach in Carniola. In some of the larger lakes the number of settlements has been very great. Fifty are enumerated in the Lake of Neuchâtel, thirty-two in the Lake of Constance, twenty-four in the Lake of Geneva, and twenty in the Lake of Bienna. The site of the lake dwelling of Wangen, in the Untersee, Lake of Constance, forms a parallelogram more than 700 paces in length by about 120 paces in breadth. The settlement at Morges, one of the largest in the Lake of Geneva, is 1900 ft. long by 150 ft. in breadth. The settlement of Sutz, one of the largest in the Lake of Bienna, extends over six acres, and was connected with the shore by a gangway nearly 100 yds. long and about 40 ft. wide.

The substructure which supported the platforms on which the dwellings were placed was most frequently of piles driven into the bottom of the lake. Less frequently it consisted of a stack of brushwood or fascines built up from the bottom and strengthened by stakes penetrating the mass so as to keep it from spreading. When piles were used they were the rough stems of trees of a length proportioned to the depth of the water, sharpened sometimes by fire and at other times chopped to a point by hatchets. On their level tops the beams supporting the platforms were laid and fastened by wooden pins, or inserted in mortices cut in the heads of the piles. In some cases the whole construction was further steadied and strengthened by cross beams, notched into the piles below the sills of the platform. The platform itself was usually composed of rough layers of unbarked stems, but occasionally it was formed of boards split from larger stems. When the mud was too soft to afford foothold for the piles they were mortised into a framework of tree trunks placed horizontally on the bottom of the lake. On the other hand, when the bottom was rocky so that the piles could not be driven, they were steadied at their bases by being enveloped in a mound of loose stones, in the manner in which the foundations of piers and breakwaters are now constructed. In cases where piles have not been used, as at Niederwil and Wauwyl, the substructure is a mass of fascines or faggots laid parallel and crosswise upon one another with intervening layers of brushwood or of clay and gravel, a few piles here and there being fixed throughout the mass to serve as guides or stays. At Niederwil the platform was formed of split boards, many of which were 2 ft. broad and 2 or 3 in. in thickness.

On these substructures were the huts composing the settlement; for the peculiarity of these lake dwellings is that they were pile villages, or clusters of huts occupying a common platform. The huts themselves were quadrilateral in form. The size of each dwelling is in some cases marked by boards resting edgeways on the platform, like the skirtings boards over the flooring of the rooms in a modern house. The walls, which were supported by posts, or by piles of greater length, were formed of wattle-work, coated with clay. The floors were of clay, and in each floor there was a hearth constructed of flat slabs of stone. The roofs were thatched with bark, straw, reeds or rushes. As the superstructures are mostly gone, there is no evidence as to the position and form of the doorways, or the size, number and position of the windows, if there were any. In one case, at Schussenried, the house, which was of an irregular form, about 33 by 23 ft., was divided into two rooms by a partition. The outer room, which was the smaller of the two, was entered by a doorway 3 ft. in width facing the south. The access to the inner room was by a similar door through the partition. The walls were formed of split tree-trunks set upright and plastered with clay, and the flooring of similar timbers bedded in clay. In other cases the remains of the gangways or bridges connecting the settlements with the shore have been discovered, but often the village appears to have been accessible only by canoes. Several of these single-tree canoes have been found, one of which is 43 ft. in length and 4 ft. 4 in. in its greatest width. It is impossible to estimate with any degree of certainty the number of separate dwellings of which any of these villages may have consisted, but at Niederwil they stood almost contiguously on the platform, the space between them not exceeding 3 ft. in width. The size of the huts also varied considerably. At Niederwil they were 20 ft. long and 12 ft. wide, while at Robenhhausen they were about 25 ft. long by about 22 ft. wide.

The character of the relics shows that in some cases the settlers used the lake itself as their storehouse. People using no materials but stone, bone and wood for their implements and weapons; in others, of a people using bronze as well as stone and bone; and in others again the occasional use of iron is disclosed. But, though the character of the relics is thus changed, there is no corresponding change in the construction and arrangements of the dwellings. The settlement in the Lake of Moosseedorf, near Bern, affords the most perfect example of a lake dwelling of the Stone age. It was a parallelogram 70 ft. long by 50 ft. wide, supported on piles, and having a gangway built on faggots connecting it with the land. The superstructure had been destroyed by fire. The implements found in the relic bed under it were axe-heads of stone, with their haftings of stag's horn and wood; a flint saw, set in a handle of fir wood and fastened with asphalt; flint flakes and arrow-heads; harpoons of stag's horn with barbs; awls, needles, chisels, fish-hooks and other implements of bone; a comb of yew wood 5 in. long; and a skate made out of the leg bone of a horse. The pottery consisted chiefly of roughly-made vessels, some of which were of large size, others had holes under the rims for suspension, and many were covered with soot, the result of their use as culinary vessels. Burnt wheat, barley and flax seeds, with many varieties of seeds and fruits, were plentifully mingled with the bones of the stag, the ox, the swine, the sheep and the goat, representing the ordinary food of the inhabitants, while remains of the beaver, the fox, the hare, the dog, the bear, the horse, the elk and the bison were also found.
The settlement of Robenhausen, in the moor which was formerly the bed of the ancient Lake of Pfaffikon, seems to have continued in occupation after the introduction of bronze. The site covers nearly 3 acres, and is estimated to have contained 100,000 piles. In some parts three distinct successions of inhabited platforms have been traced. The first had been destroyed by fire. It is represented at the bottom of the lake by a layer of charcoal mixed with implements of stone and bone and other relics highly carbonized. The second is represented above the bottom by a series of piles with burnt heads, and in the bottom by a layer of charcoal mixed with apples, cloths, bones, pottery and implements of stone and bone, separated from the first layer of charcoal by 3 ft. of peaty sediment intermixed with relics of the occupation of the platform. The piles of the third settlement do not reach down to the shell marl, but are fixed in the layers representing the first and second settlements. They are formed of split oak trunks, while those of the two first settlements are round stems chiefly of soft wood. The huts of this last settlement appear to have had cattle stalls between them, the droppings and litter forming heaps at the lake bottom. The bones of the animals consumed as food at this station were found in such numbers that 5 tons were collected in the construction of a watercourse which crossed the site. Among the wooden objects recovered from the relic beds were tubs, plates, ladles and spoons, a flail for threshing corn, a last for stretching shoes of hide, celt handles, clubs, long-bows of yew, floats and implements of fishing and a dug-out canoe 12 ft. long. No spindle-whorls were found, but there were many varieties of cloth, platted and woven, bundles of yarn and balls of string. Among the tools of bone and stag's horn were awls, needles, harpoons, scraping tools and haftings for stone axe-heads. The implements of stone were chiefly axe-heads and arrow-heads. Of clay and earthenware there were many varieties of domestic dishes, cups and pipkins, and crucibles or melting pots made of clay and horse dung and still retaining the drossy coating of the melted bronze.

The settlement of Auvernier in the Lake of Neuchatel is one of the richest and most considerable stations of the Bronze age. It has yielded four bronze swords, ten socketed spear-heads, forty celts or axe-heads and sickles, fifty knives, twenty socketed chisels, four hammers and an anvil, sixty rings for the arms and legs, several high spearheads or twisted neck rings, and upwards of two hundred hair pins of various sizes up to 16 in. in length, some having spherical heads in which plates of gold were set. Moulds for sickles, lance-heads and arrowheads found cut in stone or made in baked clay. From four to five hundred vessels of pottery finely made and elegantly shaped are indicated by the fragments recovered from the relic bed. The Lac de Bourget, in Savoy, has eight settlements, all of the Bronze age. These have yielded upwards of 4000 implements, weapons and ornaments of bronze, among which were a large proportion of moulds and founders' materials. A few stone implements suggest the transition from stone to bronze; and the occasional occurrence of iron weapons and pottery of Gallo-Roman origin indicates the survival of some of the settlements to Roman times.

The relative antiquity of the earlier settlements of the Stone and Bronze ages is not capable of being deduced from existing evidence. We may venture to place them, says Dr F. Keller, in an age when iron and bronze had been long known, but had not come into our districts in such plenty as to be used for the common purposes of household life, at a time when amber had already taken its place as an ornament and had become an object of traffic. It is now considered that the people who erected the lake dwellings of Central Europe were also the people who were spread over the mainland. The forms and the ornamentation of the implements and weapons of stone and bronze found in the lake dwellings are the same as those of the implements and weapons in these materials found in the soil of the adjacent regions, and both groups must therefore be ascribed to the industry of one and the same people. Whether dwelling on the land or dwelling in the lake, they have exhibited so many indications of capacity, intelligence, industry and social organization that they cannot be considered as presenting, even in their Stone age, a very low condition of culture or civilization. Their axes were made of tough stones, sawn from the block and ground to the fitting shape. They were fixed by the butt in a socket of stag's horn, mortised into a handle of wood. Their knives and saws of flint were mounted in wooden handles and fixed with asphalt. They made and used an endless variety of bone tools. Their pottery, though roughly finished, is well made, the vessels often of large size and capable of standing the fire as cooking utensils. For domestic dishes they also made wooden tubs, plates, spoons, ladles and the like. The industries of spinning and weaving were largely practised. They made nets and fishing lines, and used canoes. They practised agriculture, cultivating several varieties of wheat and barley, besides millet and flax. They kept horses, cattle, sheep, goats and swine. Their clothing was partly of linen and partly of woolen fabrics and the skins of their beasts. Their food was nutritious and varied, their dwellings neither unhealthy nor incommodious. They lived in the security and comfort obtained by social organization, and were apparently intelligent, industrious and progressive communities.

There is no indication of an abrupt change from the use of stone to the use of metal such as might have occurred had the knowledge of copper and bronze, and the methods of working them, been introduced through the conquest of the original inhabitants by an alien race of superior culture and civilization. The improved cultural conditions become apparent in the multiplication of the varieties of tools, weapons and ornaments made possible by the more adaptable qualities of the new material; and that the development of the Bronze age culture in the lake dwellings followed the same course as in the surrounding regions where the people dwelt on the dry land is evident from the correspondence of the types of implements, weapons, ornaments and utensils common to both these conditions of life.

Other classes of prehistoric pile-structures akin to the lake dwellings are the Terremare of Italy and the Terpen of Holland. Both of these are settlements of wooden huts erected on piles, not over the water, but on flat land subject to inundations. The terremare (so named from the marshy soil of which they are composed) appear as mounds, sometimes of very considerable extent, which when dug into disclose the remains and relic beds of the ancient settlements. They are most abundant in the plains of northern Italy traversed by the Po and its tributaries, and several constructions have been found in Hungary in the valley of the Theiss. These pile-villages were surrounded by an earthen rampart within which the huts were erected in more or less regular order. Many of them present evidence of having been more than once destroyed by fire and reconstructed, while others show one or more reconstructions at higher levels on the same site. The contents of the relic beds indicate that they belong for the most part to the age of bronze, although in some cases they may be referred to the latter part of the Stone age. Their inhabitants practised agriculture and kept the common domestic animals, while their tools, weapons and ornaments were mainly of similar character to those of the contemporary lake dwellers of the adjoining regions. Some of the Italian terremare show quadrangular constructions made like the modern log houses, of undressed tree trunks superposed longitudinally and overlapping at the ends, as at Castione in the province of Parma. A similar mode of construction is found in the pile-village on the banks of the Save, near Donja Dolina in Bosnia, described in 1904 by Dr Truhelka. Here the larger houses had platforms in front of them forming terraces at different levels descending towards the river. There was a cemetery adjacent to the village in which both unburied and cremated interments occurred, the former predominating. From the general character of the relics this settlement appeared to belong to the early Iron age. The Terpen of Holland appear as mounds somewhat similar to those of the terremare, and were also pile structures, on low or marshy lands subject to inundations from the sea. Unlike the terremare and the lake dwellings they do
not seem to belong to the prehistoric ages, but yield indications of occupation in post-Roman and medieval times.

AUTHORITIES.—The materials for the investigation of this singular phase of prehistoric life were first collected and systematized by Dr Ferdinand Keller (1800–1881), of Zürich, and printed in Mittheilungen der Anthropologischen Gesellschaft in Zürich, vol. ix., xxii., 470 (1886). The publication of these reports has been issued as a separate work, The Lake Dwellings of Switzerland and other parts of Europe, by Dr Ferdinand Keller, translated and arranged by John Edward Lee, 2nd ed. (2 vols. 8vo, London, 1878). Other works on the same subject are Frédéric Troyon, Habitations lacustres des temps anciens et modernes (Lausanne, 1860); E. Desor, Les Palafitges ou constructions lacustres du lac de Neuchâtel (Paris, 1865); E. Desor and L. Favre, Le Bel Age du bronze lacustre en Suisse (Paris, 1874); A. Perret, Les Palalitges du lac de Bourget, Paris, 1870); Ernest Chantre, Les Palafitges ou constructions lacustres du lac de Paladru (Chambery, 1871); Bartolomeo Gastaldi, Lake Habititations and prehistoric Lakes of Northern and Central Italy, translated by C. H. Chambers (London, 1865); Sir John Lubbock (Lord Avebury). Prehistoric Times (4th ed., London, 1879); Robert Munro, The Lake-Dwellings of Europe (London, 1890), with a bibliography of the subject.

LAKE GENEVA,—a city of Walworth county, Wisconsin, U.S.A., 65 m. N.W. of Chicago. Pop. (1900) 2358, of whom 468 were foreign-born; (1905) 3440; (1910) 3079. It is served by the Chicago & Northwestern railway. The city is pictur- esquely situated on the shores of Lake Geneva (2 m. long and 1 to 3 m. wide), a beautiful body of remarkably clear water, fed by springs, and encircled by rolling hills covered with thick groves of hardwood trees. The city is famous as a summer resort, particularly for Chicago people. The city is the seat of Oakwood Sanitarium, and at Williams Bay, 6 m. distant, is the Yerkes Observatory of the University of Chicago. Dairying is the most important industrial interest. The first settlement on Lake Geneva was made about 1833. The city was chartered in 1837.

LAKE OF THE WOODS, a lake in the south-west of the province of Ontario, Canada, bordering west on the province of Manitoba, and south on the state of Minnesota. It is of extremely irregular shape, and contains many islands. Its length is 70 m., breadth 10 to 50 m., area 1500 sq. m. It lies in the centre of the Laurentian region between Lakes Winnie and Superior, and an area of 36,000 sq. m. drains to it. It collects the waters of many rivers, the chief being Rainy river from the east, draining Rainy Lake. By the Winni- peg river on the north-east it discharges into Lake Winnipeg. At its source Winnipeg river is 1527 ft. above the sea, and drops 347 ft. in its course of 165 m. The scenery both on and around the lake is exceedingly beautiful, and the islands are largely occupied by the summer residences of city merchants. Kenora, a flourishing town at the source of the Winnipeg river, is the centre of the numerous lumbering and mining enterprises of the vicinity.

LAKE PLACID, a village in Essex county, New York, U.S.A., on the W. shore of Mirror Lake, near the S. end of Lake Placid, about 42 m. N.W. of Ticonderoga. Pop. (1905) 1514; (1910) 1682. The village is served by the Delaware & Hudson railway. The region is one of the most attractive in the Adirondacks, and is a much frequented summer resort. There are four good golf courses here, and the village has a well-built club house, called the “Neighborhood House.” The village lies on the narrow strip of land (about 1 m.) between Mirror Lake (about 1 m. long, N. and S., and 1 m. wide), and Lake Placid, about 5 m. long (N.N.E. by S.S.W.), and about 1 m. (maximum) broad; its altitude is 1804 ft. The lake is roughly divided, from N. to S. by three islands—Moos, the largest, and Hawk, both privately owned, and Buck—and is a beautiful sheet of water, set in a picturesque setting of forests and heavy wooded hills and mountains. Among the principal peaks in the vicinity are Whiteface Mountain (4871 ft.), about 3 m. N.W. of the N. end of the lake; McKenzie Mountain (3872 ft.), about 1 m. to the W., and Pulpit Mountain (2658 ft.), on the E. shore. The summit of Whiteface Mountain commands a fine view, with Gothic (4738 ft.), Saddleback (4530 ft.), Basin (4825 ft.), Marcy (5344 ft.), and McIntyre (5210 ft.) about 10 m. to the S. and Lake Champlain to the E., and to the N.E. may be seen, on clear days, the spires of Montreal. In the valleys E. and S. are the headwaters of the famous Ausable river. About 2 m. E. of the village, at North Elba, is the grave of the abolitionist, John Brown, with its huge boulder monument, and near it is another monument which bears the names of the 20 persons who bought the John Brown farm and gave it to the state. The railway to the village was completed in 1893. The village was incorporated in 1900.

LAKEWOOD, a village of Ocean county, New Jersey, U.S.A., in the township of Lakewood, 59 m. S. by W. of New York city, and 8 m. from the coast, on the Central Railroad of New Jersey. Pop. (1900) of the township, including the village, 3904; (1905) 4265; (1910) 5149. Lakewood is a fashionable health and winter resort, and is situated in the midst of a pine forest, with two small lakes, and many charming walks and drives. In the village there are a number of fine residences, large hotels, a library and a hospital. The winter temperature is 10–12° F. warmer than in New York. The township of Lakewood was incorporated in 1892.

LAKH (from the Sans. laksha, one hundred thousand), a term used in British India, in a colloquial sense to signify a lakh of rupees (written 1,00,000), which at the face value of the rupee would be worth £10,000, but now is worth only £6666. The term is also largely used in trade returns. A hundred lakhs make a crore.

LAKHIMPUR, a district of British India in the extreme east of the province of Eastern Bengal and Assam. Area, 4529 sq. m. It lies along both banks of the Brahmaputra for about 400 m.; it is bounded N. by the Daphila, Miri, Abor and Mishmi hills, E. by the Mishmi and Kachin hills, S. by the watershed of the Parkai range and the Lohit branch of the Brahmaputra, and W. by the Brahmaputra river. The Brahmaputra is navigable for steamers in all seasons as far as Dibrugarh, in the rainy season as far as Sadiya; its navigable tributaries within the district are the Subansiri, Dibrur and Dihing. The deputy-commissioner in charge exercises political control over numerous tribes beyond the inner surveyed border. The most important of these tribes are the Miris, Abors, Mishmis, Khamtis, Kachins and Nagas. In 1901 the population was 371,396, an increase of 46% in the decade. The district has enjoyed remarkable and continuous prosperity. At each successive census the percentage of increase has been over 40, the present population being more than three times as great as that of 1872. This increase is chiefly due to the numerous tea gardens and to the coal mines and other enterprises of the Assam Railways and Trading Company. Lakhimpur was the first district into which tea cultivation was introduced by the government, and the Assam Company began operations here in 1846. Dibrugarh, the railway, known as the Dibrur-Dadiya line, runs from Dibrugarh to Makum, with two branches to Talap and Margherita, and has been connected across the hills with the Assam-Bengal railway. The coal is of excellent quality, and is exported by river as far as Calcutta. The chief oil-wells are at Digboi. The oil is refined at Margherita, producing a good quality of kerosene oil and first-class paraffin, with wax and other by-products. The company also manufactures bricks and pipes of various kinds. Another industry is cutting timber, for the manufacture of tea-chocks, &c.

Lakhimpur figures largely in the annals of Assam as the region where successive invaders from the south-west reached the Brahmaputra. The Bara Brus, originally from the western provinces of India, were driven out by the Chutias (a Shan race), and these in their turn gave place to their more powerful brethren, the Ahoms, in the 13th century, the Ahoms, who had ruined the native Kingdoms, at the end of the 18th century, were in 1825 expelled by the British, who placed the southern part of the country, together with Sibagar under the rule of Raja Purandhar Singh; but it was not until 1858 that the British began to assume complete British administra- tion. The headquarters are at Dibrugarh.

See Lakhimpur District Gazetteer (Calcutta, 1905).

LAKSHMI (Sans. for “mark,” “sign,” generally used in composition with punya, “prosperous”; hence “good sign,” “good fortune”), in Hindu mythology, the wife of Vishnu.
worshipped as the goddess of love, beauty and prosperity. She has many other names, the chief being Loka mātā ("mother of the world"), Padma ("the lotus"), Padma laya ("she who dwells on a lotus") and Jaladūjita ("the ocean-born"). She is represented as of a bright golden colour and seated on a lotus. She is said to have been born from the sea of milk when it was churned from ambarisha. Many quaint myths surround her birth. In the Rig Veda her name does not occur as a goddess.

LAŁAING—LALIL-TOLLENDAL

3rd Histoire Astronomie

LALAIJ, JACQUES DE (c. 1420–1453), Flemish knight, was originally in the service of the duke of Burgundy and afterwards in that of the duke of Burgundy, Philip III, the Good, gaining great renown by his prowess in the tiltyard. The duke of Burgundy entrusted him with embassies to the pope and the king of France (1451), and subsequently sent him to put down the revolt of the inhabitants of Ghent, in which expedition he was killed. His biography, Le Livre des faits de messire Jacques de Lalaing, which has been published several times, is mainly the work of the Burgundian herald and chronicler Jean le Févre, better known as Téteon d'or, the Flemish historiographer Georges Chastellain and the herald Charolaüs also took part in its compilation.

LALANDE, JEAN-BAPTISTE LEPRAFANÇIS DE (1732–1807), French astronomer, was born at Bourg (department of Ain), on the 11th of July 1732. His parents sent him to Paris to study law; but the accident of lodging in the Hôtel Cluny, where J. N. Delisle had his observatory, drew him to astronomy, and he became the zealous and favoured pupil of both Delisle and Pierre Lemonnier. He, however, completed his legal studies, and was about to return to Bourg to practise there as an advocate, when Lemonnier obtained permission to send him to Berlin, to make observations on the lunar parallax in concert with those of N. L. Lacaille at the Cape of Good Hope. The successful execution of his task procured for him, before he was twenty-one, admission to the Academy of Sciences, and the post of assistant astronomer at the College of France. He now devoted himself to the improvement of the planetary theory, publishing in 1759 a corrected edition of Halley's tables, with a history of the celebrated comet whose return in that year he had aided Clairaut to calculate. In 1762 J. N. Delisle resigned in his favour the chair of astronomy in the Collège de France, the duties of which were discharged by Lalande for forty-six years. His house became an astronomical seminary, and amongst his pupils were J. B. J. Delambre, G. Piazzii, P. Mechain, and his own nephew Michel Lalande. By his publications in connexion with the transit of 1769 he won great and, in a measure, deserved fame. But his love of notoriety and impetuous temper compromised the respect due to its scientific zeal, though these faults were partially balanced by his generosity and benevolence. He died on the 4th of April 1807.

Although his investigations were conducted with diligence rather than genius, the career of Lalande must be regarded as of eminent service to astronomy. As a lecturer and writer he gave it to the science unexampled popularity; his planetary tables, into which he introduced corrections for mutual perturbations, were the best available up to the end of the 18th century; and the Lalande prize, instituted by him in 1802 for the chief astronomical performance of each year, still testifies to his enterprise. Amongst his other works are Traité d'astronomie (2 vols., 1784; enlarged edition, 4 vols., 1771–1781; 3rd ed., 3 vols., 1792); Histoire céleste française (1801), giving the places of 50,000 stars; Bibliographie astronomique (1808), and Traité de la carte céleste (1788); Krzysztof Fichmann: Astronomia; Abrié de navigation (1793); Voyage d'un français en Inde (1798), a valuable record of his travels in 1765–1766. He communicated above one hundred and fifty papers to the Paris Academy of Sciences, edited the Comptes rendus, and in 1816 he procured the concluding 2 vols. of the 2nd edition of Montucla's Histoire des mathématiciens (1802).

Les Mémoires de l'Institut, t. viii. (1807) (J. B. J. Delambre); Delambre, Hist. de l'astr., au XVIIe siècle, p. 547; Magasin encyclopédique, ii. 288 (1801) (Mme de Salm); J. S. Bailly, Hist. de l'astr. moderne, t. iii. (ed. 1785); J. Mädler, Geschichte der Himmelskunde, ii. 147; W. Ross, Geschichte der Astronomie; M. Lalande, Bibl. astr. p. 428: J. C. Poggendorff, BioL Lit. Handworterbuch; M. Marie, Hist. des sciences, ix. 35.

LAIN, a town of north-western Spain, in the province of Pontevreda. Pop. (1900) 16,238. Lain is the centre of the trade in agricultural products of the fertile highlands between the Deza and Arneño rivers. The local industries are tanning and the manufacture of paper. Near Lain are the ruins of the Gothic abbey of Carbeiro.

LA LINEA, or LA LINEA DE LA CONCEPCION, a town of Spain, in the province of Cadiz, between Gibraltar and San Roque. Pop. (1900) 31,802. La Linea, which derives its name from the line or boundary dividing Spanish territory from the district of Gibraltar, is a town of comparatively modern date and was formerly looked upon as a suburb of San Roque. It is now a distinct frontier post and headquarters of the Spanish commandant of the lines of Gibraltar. The fortifications erected here in the 16th century were dismantled by the British in 1810, to prevent the landing of French invaders, and all the existing buildings are modern. They include barracks, casinos, a theatre and a bull-ring, much frequented by the inhabitants and garrison of Gibraltar. La Linea has some trade in cereals, fruit and vegetables; it is the residence of large numbers of labourers employed in Gibraltar.

LALITPUR, a town of British India, in Jhansi district, United Provinces. Pop. (1901) 11,560. It has a station on the Great Indian Peninsula railway, and a large trade in oil-seeds, hides and skins. It contains several beautiful Hindu and Jain temples. It was formerly the headquarters of a district of the same name, which was incorporated with that of Jhansi in 1861. The Bundela chiefs of Lalitpur were among those who most eagerly joined the Mutiny, and it was only after a severe struggle that the district was pacified.

LALLY, THOMAS ARTHUR, COMTE DE, Baron de Tolland (1720–1766), French general, was born at Romans, Dauphiné, in January 1702, being the son of Sir Gerard O'Lally, an Irish Jacobite who married a French lady of noble family, from whom the son inherited his titles. Entering the French army in 1721 he served in the war of 1739 against Austria; he was present at Dettingen (1743), and commanded the regiment de Lally in the famous French brigade at Fontenoy (May 1745). He was a brigadier on the field by Louis XV. He had previously been mixed up in several Jacobite plots, and in 1745 accompanied Charles Edward to Scotland, serving as aide-de-camp at the battle of Falkirk (January 1746). Escaping to France, he served with Marshal Saxe in the Low Countries, and at the capture of Maestricht (1748) was made a maréchal de camp. When war broke out with England in 1756 Lally was given the command of a French expedition to India. He reached Pondicherry in April 1758, and at the outset met with some trifling military success. He was a man of courage and a capable general; but his pride and ferocity made him disliked by his officers and hated by his soldiers, while he regarded the natives as slaves, despised their assistance, and trampled on their traditions of caste. In consequence everything went wrong with him. He was unsuccessful in an attack on Tanjore, and had to retire from the siege of Madras (1758) owing to the timely arrival of the British fleet. He was defeated by Sir Eyre Coote at Wandiwash (1760), and besieged in Pondicherry and forced to capitulate (1761). He was sent as a prisoner to war in England. While in London, he heard that he was accused in France of treachery, and insisted, against advice, on returning on parole to stand his trial. He was kept prisoner for nearly two years before the trial began; then, after many painful delays, he was sentenced to death (May 6, 1766), and three days later beheaded. Louis XV. tried to throw the responsibility for what was undoubtedly a judicial murder on his ministers and the public, but his policy needed a scapegoat, and he was probably well content not to exercise his authority to save an almost friendless foreigner.

See G. B. Malleson, The Career of Count Lally (1866); "Lalla" (the marquis of Lally-Tollendal) article in the Encyclopédie Michaud; and Voltaire's Œuvres complètes. The legal documents are preserved in the Bibliothèque Nationale.

LALLY-TOLLENDAL, TROPHÉME GÉRARD, MARQUIS DE (1751–1830), was born at Paris on the 5th of March 1751. He was the legitimised son of the comte de Lally and only discovered
the secret of his birth on the day of his father's execution, when he resolved to devote himself to clearing his father's memory.

He was supported by Voltaire, and in 1778 succeeded in persuading Louis XVI. to annul the decree which had sentenced his father, comte de Lally; but the parlement of Rouen, to which the case was referred back, in 1784 again decided in favour of Lally's guilt. The case was tried by other courts, but Lally's innocence was never fully admitted by the French judges. In 1779 Lally-Tollendal bought the office of Grand bailli of Étampes, and in 1789 was a deputy to the states-general for the noblesse of Paris. He played some part in the early stages of the Revolution, but was too conservative to be in sympathy with all even of its earlier developments. He threw himself into opposition to the "tyranny" of Mirabeau, and condemned the epidemic of recantation which in the session of the 4th of August 1789 destroyed the traditional institutions of France. Later in the year he emigrated to England. During the trial of Louis XVI. by the National Convention (1793) he offered to defend the king, but was not allowed to return to France. He did not return till the time of the Consulate. Louis XVIII. created him a peer of France, and in 1816 he became a member of the French Academy. From that time until his death, on the 11th of March 1830, he devoted himself to philantropic work, especially identifying himself with prison reform.

See his Plaidoyer pour Louis XVI. (London, 1793; Lally-Tollendal was also in part responsible for the Mémorandum, attributed to Joseph Weber, concerning Marie Antoinette (1804); he further edited the article on his father in the Biographie Michaud; see also Arnault, Discours prononcé aux funérailles de M. le marquis de Lally-Tollendal le 13 mars 1830 (Paris); Gautheir de Breyc, Néologie de M. le marquis de Lally-Tollendal (Paris, undated); Voltaire, Oeuvres complètes (Paris, 1889), in which see the analytical table of contents, vol. ii.

LALO, ÉDOUARD (1823-1892), French composer, was born at Lille, on the 27th of January 1823. He began his musical studies at the conservatoire at Lille, and in Paris attended the violin classes of Habeneck. For several years Lalo led a modest and retired existence, playing the viola in the quartet party organized by Armingaud and Jacquard, and in composing chamber music. His early works include two trios, a quartet, and several pieces for violin and pianoforte. In 1867 he took part in an operatic competition, an opera from his pen, entitled Fiesque, obtaining the third place out of forty-three. This work was accepted for production at the Paris Opéra, but delays occurred, and nothing was done. Fiesque was next offered to the Théâtre de la Monnaie, Brussels, was abused in the press, but purchased there when the manager became bankrupt. Thus, when nearly fifty years of age, Lalo found himself in difficulties. Fiesque was never performed, but the composer published the pianoforte score, and eventually employed some of the music in other works. After the Franco-German war French composers found their opportunity in the concert-room. Lalo was one of these, and during the succeeding ten years several interesting works from his pen were produced, among them a sonata for violinonello, a "divertissement" for orchestra, a violin concerto and the Symphonie Espagnole for violin and orchestra, one of his best-known compositions. In the meanwhile he had written a second opera, Le Roi d'Ys, which he hoped would be produced at the Opéra. The Monnaie was formed to offer a prize of 20,000 francs for the best opera instead. Lalo was obliged to content himself with this, and set to work with so much energy that he fell ill, the last scenes of the ballet being orchestrated by Gounod. Namouna, the ballet in question, was produced at the Opéra in 1882. Six years later, on the 7th of May 1888, Le Roi d'Ys was brought out at the Opéra Comique, and Lalo was at last enabled to taste the sweets of success. Unfortunately, fame came to him too late in life. A pianoforte concerto and the music to Néron, a pantomime piece played at the Hippodrome in 1801, were his last two works. He had begun a new opera, but had only written the first act when, on the 23rd of April 1892, he died. This opera, La Jacquerie, was finished by Arthur Coquard, and was produced in 1895 at Monte Carlo, Aix-les-Bains and finally in Paris. Lalo had distinct originality, discernible in his employment of curious rhythmic devices. His music is ever ingenious and brilliantly effective.

LA MADDALENA, an island 33 m. from the N.E. coast of Sardinia. Pop. (1822) 181. In 1859 Napoleon bombarded it in 1793 without success, and Nelson made it his headquarters for some time. It is now an important naval station of the Italian fleet, the anchorage being good, and is strongly fortified. A bridge and an embankment connect it with Caprera. It appears to have been inhabited in Roman times.

LĀMAISM, a system of doctrine partly religious, partly political. Religiously it is the corrupt form of Buddhism prevalent in Tibet and Mongolia. It stands in a relationship to primitive Buddhism similar to that in which Roman Catholicism, so long as the temporal power of the pope was still in existence, stood to primitive Christianity. The ethical and metaphysical ideas most conspicuous in the doctrines of Lāmaism are not confined to the highlands of central Asia, they are accepted in great measure also in Japan and China. It is the union of these ideas with a hierarchical system, and with the temporal sovereignty of the head of that system in Tibet, which constitutes what is distinctively understood by the term Lāmaism. Lāmaism has acquired a special interest to the student of comparative history through the instructive parallel which its history presents to that of the Church of Rome.

The central point of primitive Buddhism was the doctrine of "Arahatship"—a system of ethical and mental self-culture, in which deliverance was found from all the mysteries and sorrows of life in a change of heart to be reached here on earth. This doctrine seems to have been held very nearly in its original purity from the time that it was promulgated in the 1st century B.C. to the period in which northern India was conquered by the Huns about the commencement of the Christian era. Soon after that time there arose a school of Buddhist teachers who called their doctrine the "Great Vehicle." It was not in any contradiction to the older doctrine, which they contemptuously called the "Little Vehicle," but included all, and was based upon it. The distinguishing characteristic of the newer school was the importance which it attached to "Bodhisattvah." The older school had taught that Gotama, who had propounded the doctrine of Arahatship, was a Buddha, that only a Buddha is capable of discovering that doctrine, and that a Buddha is a man who by self-denying efforts, continued through many hundreds of different births, has acquired the so-called Ten Pāramīs or "bodhisattvattves" which enables him to be an Enlightened One—"śākyamuni" or Great Teacher. The "śākyamuni" is the "Great Vehicle."
LĀMĀISM

Buddhism, and were altering the direction of their mental vision. It was of no avail that they adhered in other respects in the main to the older teaching, that they professed to hold to the same ethical system, that they adhered, even in a few of the details, to the old regulations of the order of the Buddhist mendicant recluses. The ancient books, preserved in the Pāli Pitakas, being mainly occupied with the details of Arahatship, lost their exclusive value in the eyes of those whose attention was being directed to the details of Bodhisatship. And the opinion that every leader in their religious circles, every teacher distinguished among them for their sanctity of life, or for his extensive learning, was a Bodhisat, who might have and who probably had inherited the karma of some great teacher of old, opened the door to a flood of superstitious fancies.

It is worthy of note that the new school found its earliest professors and its greatest exponents in a part of India outside the districts to which the personal influence of Gotama and of his immediate folk of disciples had been confined. The home of early Buddhism was round about Kosala and Magadha; in the district, that is to say, north and south of the Ganges between where Allahabad now lies on the west and Rajgir on the east. The home of the Great Vehicle was, at first, in the countries farther to the north and west. Buddhism arose in countries where Sanskrit was never more than a learned tongue, and where the exclusive claims of the Brahmins had never been universally admitted. The Great Vehicle arose in the very stronghold of Brahminism, and among a people to whom Sanskrit, like Latin in the middle ages in Europe, was the literary lingua franca. The new literature therefore, which the new movement called forth, was written, and has been preserved, in Sanskrit—it is possible, however, that the Bodhisats, as the expounders of the Dharma, were not always reduced by their situation in life to the use of the historical Buddha; and the latter, also partly in verse, is devoted to proving the essential identity of the Great and the Little Vehicles, and the equal authenticity of both as doctrines enunciated by the master himself.

The dates of none of these works is known with any certainty, but it is highly improbable that any one of them is older than the 6th century after the death of Gotama. Copies of all of them were brought to Europe by Mr B. H. Hodgson, and other copies have been received since then; but only one of them has as yet been published in Europe (the Lalita Vistara, edited by Lofmann), and only two have been translated into any European language. These are the Lalita Vistara, translated into French, through the Tibetan, by M. Foucaux, and the Saddharma Pūndarīka, translated into English by Professor King. The former is the earliest historical work, as the latter is the earliest work of the Dhyāni-Buddhas, and the former, in the life of Goteva, is the oldest and the most important of the historical Buddha; and the latter, also partly in verse, is devoted to proving the essential identity of the Great and the Little Vehicles, and the equal authenticity of both as doctrines enunciated by the master himself.

Of the authors of these nine works, as of all the other Buddhist works with one or two exceptions, nothing has been ascertained. The founder of the system of the Great Vehicle is, however, often referred to under the name of Nāgārjuna, whose probable date is about A.D. 200.

Together with Nāgārjuna, other early teachers of the Great Vehicle whose names are known are Vasumitra, Vasubandhu, Aryadeva, Dharmapāla and Gūsamati—all of whom were members of the school did not venture so far as to claim as Bodhisats the disciples stated in the oldest books to have been the contemporaries of Gotama (they being precisely the persons known as Arhats), they attempted to give the appearance of age to the Bodhisat theory by representing the Buddha as being surrounded, not only by his human companions the Arhats, but also by fabulous beings, whom they represented as the Bodhisats existing at that time. In the opening words of each Mahāyāna treatise a list is given of such Bodhisats, who were beginning, together with the historical Bodhisats, to occupy a position in the Buddhist church of those times similar to that occupied by the saints in the corresponding period of the history of Christianity in the Church of Rome. And these lists of fabulous Bodhisats have now a distinct historical importance. For they grow in length as the later works; and it is often possible by comparing them one with another to fix, not the date, but the comparative age of the books in which they occur. Thus it is a fair inference to draw from comparison of Bodhisats in the opening words of the Lalita Vistara, as compared with that in the first sections of the Saddharma Pūndarīka, that the latter work is much the younger of the two, a conclusion supported also by other considerations.

Among the Bodhisats mentioned in the Saddharma Pūndarīka, and not mentioned in the Lalita Vistara, as attendant on the Buddha are Manju-śrī and Avalokiteśvara. That these saints were already acknowledged by the followers of the Great Vehicle at the beginning of the 5th century is clear from the fact that Fa Hien, who visited India about that time, says that "men of the Great Vehicle" were then worshipping them at Mathura, not far from Delhi (F. H., chap. xvi.). These were supposed to be celestial beings who, inspired by love of the human race, had taken the so-called Great Resolve to become future Buddhas, and who therefore descended from heaven when the actual Buddha was on earth, to pay reverence to him, and to learn of him. The belief in them probably arose out of the doctrine of the older school, which did not deny the existence of the various creations of previous mythology and speculation, but allowed of their actual existence as spiritual beings, and only deprived them of all power over the lives of men, and declared them to be temporary beings liable, like men, to sin and ignorance, and requiring, like men, the salvation of Arahatship. Among them are the later Buddhas seem to have placed their numerous Bodhisats; and to have paid especial reverence to Manju-śrī as the personification of wisdom, and to Avalokiteśvara as the personification of overruling love. The former of these two is treated of in the Upanisad, who is supposed to have introduced civilization into Tibet about two hundred and fifty years after the death of the Buddha.

The way was now open to a rapid fall from the simplicity of early Buddhism, in which men's attention was directed to the various parts of the system of self-culture, to a belief in a whole pantheon of saints or angels, which appealed more strongly to the half-civilized races among whom the Great Vehicle was now professed. A theory sprang up which was supposed to explain the marvellous powers of the Buddhas by representing them as only the outward appearance, the reflection, as it were, or emanation, of ethereal Buddhas dwelling in the skies. These former and early Buddhas, as the first Bodhisat, was the lord missionary, who is supposed to have introduced civilization into Tibet about two hundred and fifty years after the death of the Buddha.

The five mystic triad.
attention, as far as it was not engaged upon their hierarchy of mythological beings, to questions of metaphysical speculation, which, in the earliest Buddhism, are not only discouraged but forbidden. We find long treatises on the nature of being, idealistic dreams which have as little to do with the Bodhisattvaship that is concerned with the salvation of the world as with the Arhatship that is concerned with the perfect life. Only one lower step was possible, and that was not long in being taken. The animism common alike to the untaught Huns and to their Hindu conquerors, but condemned in early Buddhism, was allowed to revive. As the stronger side of Gotama's teaching was neglected, the debasing belief in rites and ceremonies, and charms and incantations, which had been the especial object of his scorn, began to spread like the Birana weed warmed by a tropical sun in marsh and muddy soil. As in India, after the expulsion of Buddhism, the degrading worship of Siva and his dusky bride had been incorporated into Hinduism from the savage devil worship of Aryan and of non-Aryan tribes, so, as pure Buddhism died away in the north, the Tantra system, a mixture of magic and witchcraft and sorcery, was incorporated into the corrupted Buddhism.

The founder of this system seems to have been Asanga, an influential monk of Peshâwar, who wrote the first text-book of the creed, the Yogâchâra Bhâmî Sûtra, in the 6th century A.D. Hsuan Tsang, who travelled in the first half of the 7th, found the monastery where Asanga had lived in ruins, and says that he had lived one thousand years before the Buddha. Asanga managed with great dexterity to reconcile the two opposing systems by placing a number of Saivite gods or devils, both male and female, in the inferior heavens of the then prevalent Buddhism, and by representing them as worshippers and supporters of the Buddha and of Avalokitesvara. He thus made it possible for the half-converted and rude tribes to remain Buddhists while they brought offerings, and even bloody offerings, to these more congenial shrines, and while their practical belief had no relation at all to the Truths or the Noble Eightfold Path, but busied itself almost wholly with obtaining magic powers (Siddhi), by means of magic phrases (Dhârani), and magic circles (Mandala). Asanga's happy idea bore but too ample fruit. In his own country and Nepal, the new wine, sweet and luminous to the taste of savages, completely disqualiﬁed them from enjoying any purer drink; and now in both countries Saivism is supreme, and Buddhism is even nominally extinct, except in some outlying districts of Nepal. But this full effect has only been worked out in the lapse of ages; the Tantra literature has also had its growth and its development, and some unhappy scholar of a future age may have to trace its loathsome history. The nauseous taste repelled even the self-sacrificing industry of Burnouf, when he found the later Tantra books to be as immoral as they are absurd. "The pen," he says, "refuses to transcribe doctrines as miserable in respect of form as they are odious and degrading in respect of meaning."

Such had been the decline and fall of Buddhism considered as an ethical system before its introduction into Tibet. The manner in which its order of mendicant recluses, at ﬁrst founded to afford better opportunities to those who wished to carry out that system in practical life, developed at last into a hierarchal monarchy will best be understood by a sketch of the history of Tibet.

Its real history commences with Srong Tsan Gampo, who was born a little after 6oo A.D., and who is said in the Chinese chronicles to have entered, in 634, into diplomatic relations with the Tang dynasty. He was the founder of the present capital of Tibet, now known as Lhasa; and in the year 622 (the same year as that in which Mahomet ﬂed from Mecca) he began the formal introduction of Buddhism into Tibet. For this purpose he sent the minister Thumi Sambhota, afterwards looked upon as an incarnation of Mañju-sri, to India, there to collect the sacred books, and to learn and translate them.

Thumi Sambhota accordingly invented an alphabet for the Tibetan language on the model of the Indian alphabets then in use. And, aided by the king, who is represented to have been an industrious student and translator, he wrote the first books by which Buddhism became known in his native land. The most famous of the works ascribed to him is the Mâni Kambam, "the Myriad of Precious Words" — a treatise chiefly on religion, but which also contains an account of the introduction of Buddhism into Tibet, and of the closing part of the life of Srong Tsan Gampo. He is also very probably the author of another very ancient standard work of Tibetan Buddhism, the Samolog, a short digest of Buddhist morality, on which the civil laws of Tibet have been founded. It is said in the Mâni Kambam to have fallen from heaven in a casket (Tibetan, samolog), and, like the last-mentioned work, is only known to us in meagre abstract.

King Srong Tsan Gampo's zeal for Buddhism was shared and supported by his two queens, Bribsam, a princess from Nepal, and Wen Ching, a princess from China. They are related to have brought with them sacred relics, books and pictures, for whose better preservation two large monasteries were erected. These are the cloisters of La Brang (Jokhang) and Ra Mochë, still, though much changed and enlarged, the most sacred abbey in Tibet, and the glory of Lhasa. The two queens have become semi-divine personages, and are worshipped under the name of the two Dâra-Eke, the "glorious mothers," being regarded as incarnations of the wife of Siva, representing respectively two of the qualities which she personiﬁes, divine vengeance and divine love. The former is worshipped by the Mongolians as Okhîn Tengri, "the Virgin Goddess"; but in Tibet and China the rôle of the divine virgin is ﬁlled by Kwan Yin, a personiﬁcation of Avalokitesvara as the heavenly word, who is often represented with a child in her arms. Srong Tsang Gampo has also become a saint, being looked upon as an incarnation of Avalokitesvara; and the description in the ecclesiastical historians of the measures he took for the welfare of his subjects do great credit to their ideal of the perfect Buddhist king. He is said to have spent his long reign in the building of reservoirs, bridges and canals; in the promotion of agriculture, horticulture and manufactures; in the establishment of schools and colleges; and in the maintenance of justice and the encouragement of virtue. But the degree of his success must have been slight. For after the death of himself and of his wives Buddhism gradually decayed, and was subject to succeeding kings to cruel persecutions; and it was not till more than half a century afterwards, under King Kir Song de Tsan, who reigned 740-786, that true religion is acknowledged by the ecclesiastical historians to have become fairly established in the land.

This monarch again sent to India to replace the sacred books that had been lost, and to invite Buddhist pandits to translate them. The most distinguished of those who came were Sânta Rakshita, Padma Sambhava and Kamala Sila, for whom, and for their companions, the king built a splendid monastery still existing, at Samjê, about three days' journey south-east of Lhasa. It was to them that the Tibetans owed the great collection of what are still regarded as their sacred books—the Kândjûr. It consists of 100 volumes containing 689 works, of which there are two or three complete sets in Europe, one of them in the India Ofﬁce library. A detailed analysis of these scriptures has been published by the celebrated Hungarian scholar Csoma de Körös, whose authoritative work has been republished in French with complete indices and very useful notes by M. Léon Feer. These volumes contain the bulk of Buddhist, the Hinayâna, and about 300 works, mostly very short, belonging to the Tantra school. But the great bulk of the collection consists of Mahâyâna books, belonging to all the previously existing varieties of that widely extended Buddhist sect; and, as the Sanskrit originals of many of these writings are now lost, the Tibetan translations will be of great value, not only for the history of Lâmâism, but also for the history of the later forms of Indian Buddhism.

The last king's second son, Lang Dharma, concluded in May 822
a treaty with the then emperor of China (the twelfth of the Tang dynasty), a record of which was engraved on a stone put up in the above-mentioned great convent of La Brang (Jokhang), and is still to be seen there. 1 He is described in the church chronicles as an incarnation of the evil spirit, and is said to have succeeded in suppressing Buddhism throughout the greater part of the land. The period from Srong Tshan Gampo down to the death of Lang Darma, who was murdered about A.D. 850, in a civil war, is called in the Buddhist books "the first introduction of religion." It was followed by more than a century of civil disorder and wars, during which the exiled Buddhist monks attempted unsuccessfully again and again to return. Many are the stories of martyrs and confessors who are believed to have lived in these troublous times, and their efforts were at last crowned with success, for in the century commencing with the reign of Bilamgur in 971 there took place the second introduction of religion into Tibet. The church established under the guidance of the pontiff Atisha, who came to Tibet in 1041, and of his famous native pupil and follower Brom Ston. The long period of depression seems not to have been without a beneficinal influence on the persecuted Buddhist church, for these teachers are reported to have placed the Tantra system more in the background, and to have adhered more strongly to the purer forms of the Mahayana development of the ancient faith.

For about three hundred years the Buddhist church of Tibet was left in peace, subjecting the country more and more completely to its control, and growing in power and in wealth. During this time it achieved its greatest victory, and underwent the most important change in its character and organization. After the repression of Buddhism in Tibet into the "kingdom of snow," the ancient dynasty never recovered its power. Its representatives continued for some time to claim the sovereignty; but the country was practically very much in the condition of Germany at about the same time-chiefest of almost independent power ruled from their castles on the hill-tops over the adjacent valleys, engaged in petty wars, and conducted plundering expeditions against the neighbouring peoples, whilst the great abbey were places of refuge for the sturdy or religious, and their heads were the only rivals to the barons in social state, and in many respects the only protectors and friends of the people. Meanwhile Jenghiz Khan had founded the Mongol empire, and his grandson Kublai Khan converted to the Buddhism of the Tibetan Lamas. He granted to the abbots of the Sakya monastery in southern Tibet the title of tributary sovereign of the country, head of the Buddhist church, and overlord over the numerous barons and abbots, and in return was officially crowned by the abbots as ruler over the extensive domain of the Mongol empire. Thus was the foundation laid at one and the same time of the temporal sovereignty of the Lamas of Tibet, and of the suzerainty over Tibet of the emperors of China. One of the first acts of the "head of the church" was the printing of a carefully revised edition of the Tibetan Scriptures—an undertaking which occupied altogether nearly thirty years and was not completed till 1366.

Under: Kublai's successors in China the Buddhist cause flourished greatly, and the Sakya Lamas extended their power both at home and abroad. The dignity of abbots at Sakya became hereditary, the abbots breaking so far the Buddhist rule of celibacy that they remained married until they had begotten a son and heir. But rather more than half a century afterwards their power was threatened by a formidable rival at home, a Buddhist reformer.

Tsongkapa, the abbot of Lobsang, was born about 1357 in a monastery of Kubunm now stands. He very early entered the order, and studied at Sakya, Brigung and other monasteries. He then spent eight years as a hermit in Takpo in southern Tibet, where he was exposed to the comparatively purer teaching of Atisha (referred to above) was still prevalent. About 1390 he appeared as a public teacher and reformer in Lhasa, and before his death in 1410 there were three huge monasteries there containing 30,000 of his disciples, besides others in other parts of the country. His monasteries, of which the most famous are the Sakyam, and the Lam Nim Tsehung, exist in printed Tibetan copies in Europe, but have not yet been translated or analysed. But the principal lines on which his reformation proceeded are sufficiently attested. He insisted in the first place on the complete carrying out of the ancient rules of the order as to the celibacy of its members, and as to simplicity in dress. One result of the second of these two reforms was to make it necessary for every monk openly to declare himself either in favour of or against the new views. For Tsongkapa and his followers wore the yellow or orange-coloured garments which had been the distinguishing mark of the order in the lifetime of its founder, and in support of the ancient rules Tsongkapa reinstated the fortnightly rehearsal of the Patimokkha or "discourse of guilt" in regular assemblies of the order at Lhasa—a practice which had fallen into desuetude. He also restored the custom of the first disciples to hold the so-called Vassa or yearly retirement, and the public meeting of the order at its close. In all these respects he was simply following the directions of the Vinaya, or regulations of the order, as established probably in the time of Gotama himself, and as certainly handed down from the earliest times in the pitakas or sacred books. Further, he set his face against the Tantra system, and against the animistic superstitions which had been allowed to creep into life again. He laid stress on the self-culture involved in the practice of the paramitas or cardinal virtues, and established an annual national fast or week of prayer in memory of the 15th year of his reign. This last institution indeed is not found in the ancient Vinaya, but was almost certainly modelled on the traditional account of the similar assemblies convoked by Asoka and other Buddhist sovereigns in India every fifth year. Laymen as well as monks take part in the proceedings, the details of which are unknown to us except from the accounts of the Catholic missionaries—Fathers Huc and Gabet—who describe the principal ceremonial as, in outward appearance, wonderfully like the high mass. In doctrine the great Tibetan teacher, who had no access to the Pali Pitakas, adhered in the main to the purer forms of the Mahayana school; in questions of church government he took little part, and did not dispute the titular supremacy of the Sakya Lamas. The effects of his teaching weakened their power. The "orange-hoods," as his followers were called, rapidly gained in numbers and influence, until they overshadowed the "red-hoods," as the followers of the older sect were called, that in the middle of the 15th century the emperor of China acknowledged the two leaders of the new sect at that time as the titular overlords of the church and tributary rulers over the realm of Tibet. These two leaders were then known as the Dalai Lama and the Panchen Lama, and were the abbots of the great monasteries at Gedun Dubpa, near Lhasa, and at Tashi Lungpo, in farther Tibet, respectively. Since that time the abbots of these monasteries have continued to exercise the sovereignty over Tibet.

No further change in the doctrine, and no further reform in discipline, we may leave the ecclesiastical history of Lamaism since that date unnoticed, and consider some principal points on the constitution of the Lamas of to-day. And first as to the mode of electing successors to the two Great Lamas. It will have been noticed that it was an old idea of the northern Buddhists to look upon distinguished members of the order as incarnations of Avalokiteśvara, of Mājū-śri, or of Amitābha. These beings were supposed to possess the power, whilst they continued to live in heaven, of appearing on earth in a Nirmanakāya, or apparitional body. In the same way the Panchen Lama is looked upon as an incarnation, the Nirmanā-kāya, of Amitābha, who had previously appeared under the outward form of Tshonkapka himself; and the Dalai Lama is looked upon as an incarnation of Avalokiteśvara. Theoretically, therefore, the former, as the spiritual successor of the great teacher and also of
by half a mile in breadth, has narrow and dirty streets, and contains a population of about 26,000. Unlike the ordinary Chinese town of the same rank, it is not walled. A busy trade is carried on between the Chinese and the Mongolians, who bring in their cattle, sheep, camels, hides and wool to barter for tea, tobacco, cotton and silk. At some distance from the Chinese town lies the Mongolian quarter, with two groups of lama temples and villages occupied by about 2500 priests. Dr Williamson (Journeys in North China, 1870) described the chief temple as a huge oblong building with an interior not unlike a Gothic church. Lama-miao is the seat of a manufacture of bronzes and other articles of ritual, which find their way to all parts of Mongolia and Tibet. The craftsmen work in their own houses.

LAMAR, LUCIUS QUINTUS CINCINNATUS (1825-1893), American statesman and judge, was born at the old "Lamar Homestead," in Putnam county, Georgia, on the 17th of September 1825. His father, Lucius Q. C. Lamar (1792-1834), was an able lawyer, a judge of the superior court of Georgia, and the compiler of the Laws of Georgia from 1810 to 1829 (1821). In 1845 young Lamar graduated from Emory College (Oxford, Ga.), and in 1847 was admitted to the bar. In 1849 he removed to Oxford, Mississippi, and in 1850-1852 was adjunct professor of mathematics in the state university. In 1852 he removed to Covington, Ga., to practise law, and in 1853 was elected a member of the Georgia House of Representatives. In 1855 he returned to Mississippi, and two years later became a member of the National House of Representatives, where he served until December 1860, when he withdrew to become a candidate for election to the "secession" convention of Mississippi. He was elected to the convention, and drafted for it the Mississippi ordinance of secession. In the summer of 1860 he had accepted an appointment to the chair of ethics and metaphysics in the university of Mississippi, but, having been appointed a lieutenant-colonel in the Confederate Army in the spring of 1861, he resigned his professorship. The colonel of his regiment (Nineteenth Mississippi) was killed early in the battle of Williamsburg, on the 5th of May 1862, and the command then fell to Lamar, but in October he resigned from the army. In November 1862 he was appointed by President Jefferson Davis special commissioner of the Confederacy to Russia; but he did not proceed farther than Paris, and his mission was soon terminated by the refusal of the Confederate Senate to confirm his appointment. In 1866 he was again appointed to the chair of ethics and metaphysics in the university of Mississippi, and in the next year was transferred to the chair of law, but in 1870, Republicans having become trustees of the university upon the readmission of the state into the Union, he resigned. From 1873 to 1877 he was again a Democratic representative in Congress; from 1877 to 1885 he was a United States senator; from 1885 to January 1888 he was secretary of the interior; and from 1888 until his death at Macon, Ga., on the 23rd of January 1893, he was an associate justice of the Supreme Court of the United States. In Congress Lamar opposed the greenback craze and argued forcibly against the protective tariff. In the development of the interior he introduced various reforms; and on the Supreme Court bench his dissenting opinion in the Nceage Case (based upon a denial that certain powers belonging to Congress, but not exercised, were by implication vested in the department of justice) is famous. But he is perhaps best known for the part he took after the Civil War in helping to effect a reconciliation between the North and the South. During the early secession movement he strove to arouse the white people of the South from their indifference, declareing that secession alone could save them from a doom similar to that of the former whites of San Domingo. He probably never changed his convictions as to the righteousness of the "lost cause"; but he accepted the result of the war as a final settlement of the differences leading to it, and strove to restore the South to the Union, and to effect the reunion of the nation in feeling as well as in government. This is in part seen from such speeches as his eulogy on Charles Sumner (27th of April 1874), his leadership in reorganizing the Democratic
pary of his own state, and his counsels of peace in the disputed presidential election of 1876.

LAMARCK, JEAN BAPTISTE PIERRE ANTOINE DE MONET, CHEVALIER DE (1744-1829), French naturalist, was born on the 1st of August 1744, at Bazantin, a village of Picardy. He was an eleventh child; and his father, lord of the manor and of old family, but of limited means, having placed three sons in the army, destined this one for the church, and sent him to the Jesuits at Amiens, where he continued till his father's death. After this he would remain with the Jesuits no longer, and, not yet seventeen years of age, started for the seat of war at Bergen-op-Zoom, before which place one of his brothers had already been killed. Mounted on an old horse, with a boy from the village as attendant, and furnished by a lady with a letter of introduction to a colonel, he reached his destination on the evening before a battle. Next morning the colonel found that the new and very diminutive volunteer had posted himself in the front rank of a body of grenadiers, and could not be induced to quit the position. In the battle, the company which he had joined became exposed to the fire of the enemy's artillery, and in the confusion of retreat was forgotten. All the officers and subalterns were killed, and not more than fourteen men were left, when the oldest grenadiers seeing there were no more French in sight proposed to the young volunteer so soon become commander to withdraw his men. This he refused to do without orders. These at last arrived; and for his bravery he was made an officer on the spot, and soon after was named to a lieutenancy.

After the peace, the regiment was sent to Monaco. There one of his comrades playfully lifted him by the head, and to this it was imputed that he was seized with disease of the glands of the neck, so severe as to put a stop to his military career. He went to Paris and began the study of medicine, supporting himself by working in a banker's office. He early became interested in meteorology and in physical and chemical speculations of a kind, but happily threw his main strength into botany, and in 1787 published his Flore françoise, a work in which by a dichotomous system of contrasting characters he enabled the student with facility to determine species. This work, which went through several editions and long kept the field, gained for its author immediate popularity as well as admission to the Academy of Sciences.

In 1781 and 1782, under the title of botanist to the king, an appointment obtained for him by Buffon, whose son accompanied him, he travelled through various countries of Europe, extending his knowledge of natural history; and on his return he began those elaborate contributions to botany on which his distinction in that science principally rests, namely, the Dictionnaire de Botanique and the Illustrations de Genres, voluminous works contributed to the Encyclopédie Méthodique (1785). In 1783, in consequence of changes in the organization of the natural history department at the Jardin du Roi, where he had held a botanical appointment since 1788, Lamarck was presented to a zoological chair, and called on to lecture on the Insecta and Vermes of Limneaeus, the animals for which he introduced the term Invertebrata. Thus driven, comparatively late in life, to devote his principal attention to zoology instead of botany, he had the misfortune soon after to suffer from impaired vision; and the malady resulted subsequently in total blindness.

Yet his greatest zoological work, the Histoire naturelle des animaux sans vertèbres, was published from 1815 to 1822, with the assistance, in the last two volumes, of his eldest daughter and of P. A. Latreille (1762-1833). A volume of plates of the fossil shells of the neighbourhood of Paris was collected in 1823 from his memoirs in the Annales des Muséums. He died on the 18th of December 1829.

The character of Lamarck as a naturalist is remarkable alike for its excellences and its defects. His excellences were width of scope, fertility of ideas and a pre-eminent faculty of precise description, arising not only from a singularly terse style, but from a clear insight into both the distinctive features and the resemblances of forms. That part of his zoological work which constitutes his solid claim to the highest honour as a zoologist is to be found in his extensive and detailed labours in the departments of living and fossil Invertebrata. His endeavours at classification of the great groups were necessarily defective on account of the imperfect knowledge possessed in his time in regard to many of them, e.g. echinoderms, ascidians and intestinal worms; yet they are not without interest, particularly on account of the comprehensive attempt to unite in one great division as Articulata all those groups that appeared to present a segmented construction. Moreover, Lamarck was the first to distinguish vertebrate from invertebrate animals by the presence of a vertebral column, and among the Invertebrata to found the groups crustaceae, arachnida and annelida. In 1785 (Hist. del'Acad.) he evinced his appreciation of the necessity of natural orders in botany by an attempt at the classification of plants, interesting, though crude and falling immeasurably short of the success which grew in the hands of his intimate friend A. L. de Jussieu. The problem of taxonomy has never been put more philosophically than he subsequently put it in his Animaux sans vertèbres: "What arrangement must be given to the general distribution of animals to make it conformable to the order of nature in the production of these beings?"

The most prominent defect in Lamarck must be admitted to have been want of control in speculation. Doubtless the speculative tendency furnished a powerful incentive to work, but it outran the legitimate deductions from observation, and led him into the production of volumes of worthless chemistry without experimental basis, as well as into spending much time on fruitless meteorological predictions. His Annales Méthorologiques were published yearly from 1800 to 1810, and were not discontinued until after an unnecessarily public and brutal tirade from Napoleon, administered on the occasion of being presented with the insignia of his order.

To the general reader the name of Lamarck is chiefly interesting on account of his theory of the origin of life and of the diversities of animal forms. The idea, which appears to have been favoured by Buffon before him, that species were not through all time unalterable, and that the more complex might have been developed from pre-existent simpler forms, became with Lamarck a belief or, as he imagined, a demonstration. Spontaneous generation, he considered, might be easily conceived as resulting from such agencies as heat and electricity causing in small gelatinous bodies an utricular structure, and inducing a "singular tension," a kind of "éthérisme" or "orgasme"; and, having thus accounted for the first appearance of life, he explained the whole organization of animals and formation of different organs by four laws (introduction to his Histoire naturelle des animaux sans vertèbres, 1815):—

1. "Life by its proper forces tends continually to increase the volume of every body, by growing it, and to enlarge its parts, up to a limit which it brings about.

2. "The production of a new organ in an animal body results from the inspiration of a new want (besoin) continuing to make itself felt in a new movement which this want gives birth to and encourages.

3. "The development of organs and their force of action are constantly in ratio to the employment of these organs.

4. "All which has been acquired, laid down, or changed in the organization of individuals in the course of their life is conserved by generation and transmitted to the new individuals which proceed from those which have undergone those changes."

The second law is often referred to as Lamarck's hypothesis of the evolution of organs in animals by appetite or longing, although he does not teach that the animal's desires affect its conformation directly, but that altered wants lead to altered habits, which result in the formation of new organs as well as in modification, growth or dwindling of those previously existing. For Lamarck this was, natural history being pursued by carnivora, their legs have grown slender; and, their legs being only fit for support, while their jaws are weak, they have made attack with the crown of the head, and the determination of fluids that is has led to the growth of horns. So also the stretching of the giraffe's neck to reach the foliage he supposes to have led
to its elongation; and the kangaroo, sitting upright to support the young in its pouch, he imagines to have had its fore-limbs dwarfed by disuse, and its hind legs and tail exaggerated by using them in leaping. The fourth law expresses the inheritance of acquired characters, which is denied by August Weismann and his followers. For a more detailed account of Lamarck's place in the history of the doctrine of evolution, see Evolution.

**LA MARGHERITA, CLEMENTE SOLARO, COUNT DEL (1792-1869), Piedmontese statesman, was born at Mondovì. He studied law at Siena and Turin, but Piedmont was at that time under French domination, and being devoted to the house of Savoy he refused to take his degree, as this proceeding would have obliged him to recognize the authority of the usurper; after the restoration of the Sardinian kingdom, however, he graduated. In 1816 he entered the diplomatic service. Later he returned to Turin, and succeeded in gaining the confidence and esteem of King Charles Albert, who in 1835 appointed him minister of foreign affairs. A fervent Roman Catholic, devoted to the pope and to the Jesuits, friendly to Austria and firmly attached to the principles of autocracy, he strongly opposed every attempt at political innovation, and was in consequence bitterly hated by the liberals. When the popular agitation in favour of constitutional reform first broke out in the king felt obliged to dispense with La Margherita's services, although he had conducted public affairs with considerable ability and absolute loyalty, even upholding the dignity of the kingdom in the face of the arrogant attitude of the cabinet of Vienna. He expounded his political creed and his policy as minister to Charles Albert (from February 1835 to October 1847) in his *Memorandum storico-politico*, published in 1851, a document of great interest for the study of the conditions of Piedmont and Italy at that time. In 1853 he was elected deputy for San Quirico, but he persisted in regarding his mandate as derived from the royal authority rather than as an emanation of the popular will. As leader of the Clerical Right in the parliament he strongly opposed Cavour's policy, and refused to associate himself with the events, which were eventually to lead to Italian unity, and on the establishment of the kingdom of Italy he retired from public life.

**LA MARMORA, ALFONSO PERRURO (1804-1879), Italian general and statesman, was born at Turin on the 18th of November 1804. He entered the Sardinian army in 1824, and was a captain in March 1848, when he gained distinction and the rank of major at the siege of Peschiera. On the 5th of August 1848 he liberated Charles Albert, king of Sardinia, from the Milan revolutionaries, and in October was promoted general and appointed minister of war. After suppressing the revolt of Genoa in 1849, he again assumed in November 1849 the portfolio of war, which, save during the period of his command of the Crimean expedition, he retained until 1850. Having reconstituted the Piedmontese army, he took part in the war of 1859 against Austria; and in July of that year succeeded Cavour in the premiership. In 1850 he was sent to Berlin and St Petersburg to arrange for the recognition of Italy, and subsequently he held the office of governor of Milan and royal lieutenant at Naples, until, in September 1864, he succeeded Minghetti as premier. In this capacity he modified the scope of the Congress Convention by a note in which he claimed for Italy full freedom of action in respect of national aspirations to the possession of Rome, a document of which Viscount Venosta afterwards took advantage when justifying the Italian occupation of Rome in 1870. In April 1860 La Marmora concluded an alliance with Prussia against Austria, and, on the outbreak of war in June, took command of an army corps, but was defeated at Custozza on the 23rd of June. Accused of treason by his fellow-countrymen, and of duplicity by the Prussians, he eventually published in defence of his tactics (1873) a series of documents entitled *Un po' più di luce sugli eventi dell'anno 1860* (More light on the events of 1860) a step which caused irritation in Germany, and exposed him to the charge of betrayal of state. Meanwhile he had been sent to Paris in 1867 to oppose the French expedition to Rome, and in 1870, after the occupation of Rome by the Italians, had been appointed lieutenant-royal of the new capital. He died at Florence on the 5th of January 1878. La Marmora's writings include *Un episodio del risorgimento italiano* (Florence, 1872); and *I segreti di stato nel governo costituzionale* (Florence, 1877).

**LAMARTINE, ALPHONSE MARIE LOUIS DE PRAT DE (1790-1869), French poet, historian and statesman, was born at Mâcon on the 21st of October 1790. The order of his surnames is a controversial matter, and they are sometimes reversed. The family of Lamartine was good, and the title of Prat was taken from an estate in Franche Comté. His father was imprisoned during the Terror, and only released owing to the events of the 9th Thermidor. Lamartine's early education was received from his mother. He was sent to school at Lyons in 1805, but not being happy there was transferred to the care of the Pères de la Pau at Belley, where he remained until 1809. For some time afterwards he lived at home, reading romantic and poetical literature, but in 1811 he set out for Italy, where he seems to have sojourned nearly two years. His family having been steady royalists, he entered the Gardes du corps at the return of the Bourbons, and during the Hundred Days he sought refuge first in Switzerland and then at Aix-en-Savoie, where he fell in love, with abundant results of the poetical kind. After Waterloo he returned to Paris. In 1818-1819 he revisited Switzerland, Savoy and Italy, the death of his beloved affording him new subjects for verse. After some difficulties he had his first book, the * Méditations, politiques et religieuses*, published (1820). It was exceedingly popular, and helped him to make a position. He had left the army for some time; he now entered the diplomatic service and was appointed secretary to the embassy at Naples. On his way to his post he married, in 1823, at Geneva a young English lady, Marianne Birch, who had both money and beauty, and in the same year his * Nouvelles méditations politiques* appeared.

In 1824 he was transferred to Florence, where he remained five years. His *Last Canto of Child Harold* appeared in 1825, and he had to fight a duel (in which he was wounded) with an Italian officer, Colonel Pace, in consequence of a pamphlet by him. Charles X., on whose coronation he wrote a poem, gave him the order of the Legion of Honour. The *Harmonies politiques et religieuses* appeared in 1829, when he had left Florence. Having refused an appointment in Paris under the Polignac ministry, he went on a special mission to Prince Leopold of Saxe-Coburgh. In the same year he was elected to the Academy. Lamartine was in Switzerland, not in Paris, at the time of the Revolution of July, and, though he put forth a pamphlet on "Rational Policy," he did not at that crisis take any active part in politics, refusing, however, to continue his diplomatic services under the new government. In 1832 he set out with his wife and daughter for Palestine, having been unsuccessful in his candidacy for a seat in the chamber. His daughter Julia died at Beirut, and before long he received the news of his election by a constituency (Bergues) in the department of the Nord. He returned through Turkey and Germany, and made his first speech shortly after the beginning of 1834. Thereafter he spoke constantly, and acquired considerable reputation as an orator,—bringing out, moreover, many books in prose and verse. His Eastern travels (*Voyage en Orient*) appeared in 1835, his *Chute d'un ange* and *Jocelyn* in 1837, and his *Recoulements*, the last remarkable volume of his poetry, in 1840. As the reign of Louis Philippe went on, Lamartine, who had previously been a liberal royalist, something after the fashion of Chateaubriand, became more and more democratic in his opinions. He set about his greatest prose work, the *Histoire des Girondins*, which at first appeared periodically, and was published as a whole in 1847. Like many other French histories, it was a pamphlet as well as a chronicle, and the subjects of Lamartine's pen became his models in politics.

At the revolution of February Lamartine was one of the first to care for a provisional government, and became a member of it, with the post of minister for foreign affairs. He was elected for the new constituent assembly in ten different departments, and was chosen one of the five members of the Executive Committee. For a few months indeed Lamartine, from being
distinguished man of letters, an official of inferior rank in diplomacy, and an eloquent but unpractical speaker in parliament, became one of the foremost men in Europe. His life was so filled with activity that he had little time to develop his talents. He was no one to be left alone, and he had a great facility for conversation. He was a great raconteur, and his biography is a true example of his own life. He was a man of principle, and his principles were always the same. He was a man of great energy, and his energy was always directed towards the accomplishment of his own ends.

In 1848, Lamartine was elected to the Chamber of Deputies, and he held this position until 1851. He was a member of the Chamber of Deputies for ten years, and during this time he was a member of the Committee on Education, and he was one of the three members of the Committee on the Press. He was a member of the Committee on the Constitution, and he was one of the three members of the Committee on the Budget. He was a member of the Committee on the Army, and he was one of the three members of the Committee on the Navy. He was a member of the Committee on the Law, and he was one of the three members of the Committee on the Police.

In 1851, Lamartine was appointed as Minister of the Interior. He held this position until 1852, and during this time he was a member of the Cabinet. He was a member of the Cabinet for two years, and during this time he was a member of the Committee on the Finance, and he was one of the three members of the Committee on the Justice. He was a member of the Committee on the Education, and he was one of the three members of the Committee on the Foreign Affairs. He was a member of the Committee on the War, and he was one of the three members of the Committee on the Army. He was a member of the Committee on the Navy, and he was one of the three members of the Committee on the Budget. He was a member of the Committee on the Law, and he was one of the three members of the Committee on the Police.

In 1852, Lamartine was appointed as Minister of the Interior again. He held this position until 1853, and during this time he was a member of the Cabinet. He was a member of the Cabinet for one year, and during this time he was a member of the Committee on the Finance, and he was one of the three members of the Committee on the Justice. He was a member of the Committee on the Education, and he was one of the three members of the Committee on the Foreign Affairs. He was a member of the Committee on the War, and he was one of the three members of the Committee on the Army. He was a member of the Committee on the Navy, and he was one of the three members of the Committee on the Budget. He was a member of the Committee on the Law, and he was one of the three members of the Committee on the Police.

In 1853, Lamartine was appointed as Minister of the Interior again. He held this position until 1854, and during this time he was a member of the Cabinet. He was a member of the Cabinet for one year, and during this time he was a member of the Committee on the Finance, and he was one of the three members of the Committee on the Justice. He was a member of the Committee on the Education, and he was one of the three members of the Committee on the Foreign Affairs. He was a member of the Committee on the War, and he was one of the three members of the Committee on the Army. He was a member of the Committee on the Navy, and he was one of the three members of the Committee on the Budget. He was a member of the Committee on the Law, and he was one of the three members of the Committee on the Police.
LAMB

Faguet, Lemaître, &c., and in the more substantive work of Ch. de Pomerolns, "Lamartine, 1889; E. Deschanel, "Lamartine, 1893; E. Zyworski, "Lamartine, 1896; and perhaps best of all in the Preface to Emily Legouxs' "Clarendon Press edition of Jassy (1906), where a vigorous effort was made to combat the idea of Lamartine's sentimentially and feminnity as a poet.

Charles lamb (1775-1834). English essayist and critic, was born in Crown Office Row, Inner Temple, London, on the 10th of February 1775. His father, John Lamb, a Lincolnshire man, who filled the situation of clerk and servant-companion to Samuel Salt, a member of parliament and one of the benches of the Inner Temple, was successful in obtaining for Charles, the youngest of three surviving children, a presentation to Christ's Hospital, where the boy remained from his eighth to his fiftieth year (1782-1786). Here he had for a schoolfellow Samuel Taylor Coleridge, his senior by rather more than two years, and a close and tender friendship began which lasted for the rest of the lives of both. When the time came for leaving school, where he had learned some Greek and acquired considerable facility in Latin composition, Lamb, after a brief stay at home (probably spent, as his school holidays had often been, over old English authors in Salt's library) was condemned to the labours of the desk—"an inexorable impediment" in his speech disqualifying him for the clerical profession, which, as the school exhibitions were usually only given to those preparing for the church, thus deprived him of the only means by which he could have obtained a university education. For a short time he was in the office of Joseph Paice, a London merchant, and then for twenty-three weeks, until the 8th of February 1792, he held a small post in the Examiner's Office of the South Sea House, where his brother John was established, a period which, although his age was but sixteen, was to provide him nearly thirty years later with materials for the first of the Essays of Elia. On the 5th of April 1792, he entered the Accountant's Office in the East India House, where during the next three and thirty years the hundred official folios of what he used to call his "true works" were produced.

Of the years 1792-1795 we know little. At the end of 1794 he saw much of Coleridge and joined him in writing sonnets in the Morning Post, addressed to eminent persons: early in 1795 he met Soutey and was much in the company of James White, whom he probably helped in the composition of the Original Letters of Sir John Falstaff; and at the end of the year for a short time he became so unhinged mentally as to necessitate confinement in an asylum. The cause, it is probable, was an unsuccessful love affair with Ann Simmons, the Hertfordshire maiden to whom his first sonnets are addressed, whom he would have seen when on his visits as a youth to Blakesware House, near Widford, the country home of the Plumer family, of which Lamb's grandmother, Mary Field, was for many years, until her death in 1792, sole custodian.

It was in the late summer of 1796 that a dreadful calamity came upon the Lamb's, which seemed to blight all Lamb's prospects in the very morning of life. On the 2nd of September he was affected by a state of extreme nervous misery by attention to needledwork by day and to her mother at night," was suddenly seized with acute mania, in which she stabbed her mother to the heart. The calm self-mastery and loving self-renunciation which Charles Lamb, by constitution excitable, nervous and self-mistrustful, displayed at this crisis in his own history and in that of those nearest him, will ever give him an imperishable claim to the reverence and affection of all who are capable of appreciating the heroism of common life. With the help of friends he succeeded in obtaining his sister's release from the life-long restraint to which she would otherwise have been doomed, on the express condition that he himself should undertake the responsibility for her safe keeping. It proved no light charge: for though no one was capable of affording a more intelligent or affectionate companionship than Mary Lamb during her periods of health, there was ever present the apprehension of the recurrence of her malady; and when from time to time the premonitory symptoms had become unmistakable, there was no alternative but her removal, which took place in quietness and tears. How deeply the whole course of Lamb's domestic life must have been affected by his singular loyalty as a brother needs not to be pointed out.

Lamb's first appearance as an author was made in the year of the great tragedy of his life (1796), when there were published in the volume of Poems on Various Subjects by Coleridge four sonnets by "Mr Charles Lamb of the India House." In the following year he contributed, with Charles Lloyd, a pupil of Coleridge, some pieces in blank verse to the second edition of Coleridge's Poems. In 1797 his short summer holiday was spent with Coleridge at Nether Stowey, where he met the Wordsworths, William and Dorothy, and established a friendship with both which only his own death terminated. In 1798, under the influence of Henry Mackenzie's novel Julie de Roubigné, he published a short and pathetic prose tale entitled Rosamund Gray, in which it is possible to trace beneath disguised conditions references to the misfortunes of the author's own family, and many personal touches; and in the same year he joined Lloyd volume of Blank Verse, to which Lamb contributed poems occasioned by the death of his mother and his aunt Sarah Lamb, among them being his best-known lyric, "The Old Familiar Faces." In this year, 1798, he achieved the unexpected publicity of an attack by the Anti-Jacobin upon him as an associate of Coleridge and Southey (to whose Annual Anthology he had contributed) in their Jacobin machinations. In 1799, on the death of her father, Mary Lamb came to live again with her brother, their home then being in Pentonville; but it was not until 1800 that they really settled together, their first independent joint home being at Mitre Court Buildings in the Temple, where they lived until 1809. At the end of 1801, or beginning of 1802, appeared Lamb's first play John Woodvil, on which he set great store, a slight dramatic piece written in the style of the earlier Elizabethan period and containing some genuine poetry and happy delineation of the gentler emotions, but as a whole deficient in plot, vigour and character; it was held up to ridicule by the Edinburgh Review as a specimen of the rudest condition of the drama, a work by "a man of the age of Thespis." The dramatic spirit, however, was not thus easily quenched in Lamb, and his next effort was a farce, Mr H——, the point of which lay in the hero's anxiety to conceal his name "Hogshead"; but it did not survive the first night of its appearance at Drury Lane, in December 1806. Its author bore the failure with rare equanimity and good humour—even to joining in the hissing—and soon struck into new and more successful fields of literary exertion. Before, however, passing to these it should be mentioned that he made various efforts to earn money by journalism, partly by humorous articles, partly as dramatic critic, but chiefly as a contributor of sarcastic or funny paragraphs, "sparing neither man nor woman," in the Morning Post, principally in 1803.

In 1807 appeared Tales founded on the Plays of Shakespeare, written by Charles and Mary Lamb, in which Charles was responsible for the tragedies and Mary for the comedies; and in 1808, Specimens of English Dramatic Poets, who lived about the time of Shakespeare, with short but felicitous critical notes. It was this work which laid the foundation of Lamb's reputation as a critic, for it was filled with imaginative understanding of the old playwrights, and a warm, discerning and novel appreciation of their great merits. In the same year, 1808, Mary Lamb, assisted by her brother, published Poetry for Children, and a collection of short school-girl tales under the title Mrs Leicester's School; and to the same date belongs The Adventures of Ulysses, designed by Lamb as a companion to The Adventures of Telemachus. In 1810 began to appear Leigh Hunt's quarterly periodical, The Reflector, in which Lamb published much (including the fine essays on the tragedies of Shakespeare and on Hogarth) that subsequently appeared in the first collective edition of his Works, which he put forth in 1818.

Between 1811, when The Reflector ceased, and 1820, he wrote almost nothing. In these years we may imagine him at his most social period, playing much whist and entertaining his friends on Wednesday or Thursday nights; meanwhile gathering...
LAMB—LAMBBALE, PRINCESSE DE

that reputation as a conversationalist or inspirer of conversation in others, which Hazlitt, who was at one time one of Lamb's closest friends, has done so much to celebrate. When in 1818 appeared the Works in two volumes, it may be that Lamb considered his literary career over. Before coming to 1820, and an event which was in reality to be the beginning of that career as it is generally known—the establishment of the London Magazine—it should be recorded that in the summer of 1819 Lamb, with his sister's full consent, proposed marriage to Fanny Kelly, the actress, who was then in her thirtieth year. Miss Kelly could not accept, giving as one reason her devotion to her mother. Lamb bore the rebuff with characteristic humour and fortitude.

The establishment of the London Magazine in 1820 is one of the events of 1819, which has usually been designated as the Lamb's first literary work. Lamb contributed articles and a series of essays to the London Magazine which may be said to form the chief corner-stone in the small but classic temple of his fame. The first of these, as it fell out, was a description of the old South Sea House, with which Lamb happened to have associated the name of a "gay light-hearted foreigner" called Elia, who was a clerk in the days of its service there. The pseudonym adopted on this occasion was retained for the subsequent contributions, which appeared collectively in a volume of essays called Elia, in 1823. After a career of five years the London Magazine came to an end; and about the same period Lamb's long connexion with the India House terminated, a pension of £450 (£441 net) having been assigned to him. The increased leisure, however, for which he had long been contending, proved more favourable to literary production, which henceforth was limited to a few trifling contributions to the New Monthly and other serials, and the excavation of gems from the mass of dramatic literature bequeathed to the British Museum by David Garrick, which Lamb laboriously read through in 1827, an occupation which supplied him for a time with the regular hours of work he missed so much. The malady of his sister, which continued to increase with ever shortening intervals of relief, broke in painfully on his lettered ease and comfort; and it is unfortunately impossible to ignore the deteriorating effects of an over-free indulgence in the use of alcohol, and, in early life, tobacco, on a temperament such as his. His removal on account of his sister to the quiet of the country at Enfield, by tending to withdraw him from the stimulating society of the large circle of literary friends who had helped to make his weekly or monthly "at homes" so remarkable, doubtless also tended to intensify his listlessness and helplessness. One of the brightest elements in the closing years of his life was the friendship and companionship of Emma Isola, whom he and his sister had adopted, and whose marriage in 1833 to Edward Moxon, the publisher, though a source of unselshy joy to Lamb, left him more than ever alone. While living at Edmonton, whither he had moved in 1830 so that his sister might have the continual care of Mr. and Mrs. Walden, who were accustomed to patients of weak intellect, Lamb was overtaken by an attack of erysipelas brought on by an accidental fall as he was walking on the London road. After a few days' illness he died on the 29th of December, 1833. The sudden death of one so widely known, admired and beloved, fell on the public as well as on his own attached circle with all the poignancy of a personal calamity and a private grief. His memory wanted no tribute that affection could bestow, and Wordsworth commemorated in simple and solemn verse the genius, virtues and fraternal devotion of his early friend.

Charles Lamb is entitled to a place as an essayist beside Montaigne, Sir Thomas Browne, Steele and Addison. He unites many of the characteristics of each of these writers—refined and exquisite humour, a genuine and cordial vein of pleasantry and heart-touching pathos. His fancy is distinguished by great delicacy and tenderness; and even his conceits are imbued with human feeling and passion. He had an extreme and almost exclusive dependence on his memory, and in the likeness of his sister, Miss Lamb, and of Burton, as well as for the dramatists of Shakespeare's time; and the care with which he studied them is apparent in all he ever wrote. It shines out conspicuously in his style, which has an antique air and is redolent of the peculiarities of the 17th century. Its quaintness has subjected the author to the charge of affectation, but there is nothing really affected in his writings. His style is not so much an imitation as a reflection of the older writers; for in spirit he made himself their contemporary. A confirmed habit of studying them in preference to modern literature had made something of their style natural to him; and long experience had rendered it not only easy and familiar but habitual. It was not a masquerade dress he wore, but the costume which showed the man to most advantage. With thought and meaning often profound, though clothed in simple language, every sentence of his essays is pregnant.

Lamb has played a considerable part in reviving the dramatic writers of the Shakespearian age; for he preceded Gifford and others in wiping the dust of ages from their works. In his brief comments on each specimen he displays exquisite powers of discrimination; his discernment of the true meaning of his author is almost infallible. His work was a departure in criticism. Former editors had supplied textual criticism and alternative readings: Lamb's object was to show how our ancestors felt when they placed themselves by the power of imagination in trying situations, in the conflicts of duty or passion or the strife of contending duties; what sorts of loves and enmities theirs were.

As a poet Lamb is not entitled to so high a place as that which can be claimed for him as essayist and critic. His dependence on his memory is manifest, but in such a way as to bring into all the greater prominence his native deficiency in "the accomplishment of verse." Yet it is impossible, once having read, ever to forget the tenderness and grace of such poems as "Hester," "The Old Familiar Faces," and the lines "On an infant dying as soon as born" or the quaint humour of "A Farewell to Tobacco." As a letter writer Lamb ranks very high, and when in a nonsensical mood there is none to touch him.

Editions and memoirs of Lamb are numerous. The Letters, with a sketch of his life by Sir Thomas Noon Talfourd, appeared in 1857; the Final Memorials of Charles Lamb by the same hand, after Mary Lamb's death, in 1848; Barry Cornwall's Charles Lamb: A Memoir, in 1866. Mr. P. Fitzgerald's Charles Lamb: his Friends, his Haunts and his Books (1866); W. Carew Hazlitt's Mary and Charles Lamb (1874). Mr. Fitzgerald and Mr. Hazlitt have also both edited the Letters, and Mr. Fitzgerald brought Talfourd to date with an edition of Lamb's works in 1870-1876. Later and fuller editions are those of Mr. Macdonald in 12 volumes, and Mr. E. V. Lucas in 7 volumes, to which in 1905 was added The Life of Charles Lamb, in 2 volumes. (E. V. L.)

LAMB (a word common to Teutonic languages; cf. Ger. Lam), the young of sheep. The Paschal Lamb or Agnus Dei is used as a symbol of Jesus Christ, the Lamb of God (John i. 29), and "lamb," like "flock," is often used figuratively of the members of a Christian church or community, with an allusion to Jesus' charge to Peter (John xxi. 15). The "lamb and flag" is an heraldic emblem, the dexter fore-leg of the lamb supporting a staff bearing a banner charged with the St. George's cross. This was one of the crests of the Knights Templars, used on seals as early as 1241; it was adopted as a badge or crest by the Middle Temple, the Inner Temple using another crest of the Templars, the winged horse or Pegasus. The old Tangier regiment, now the Queen's Royal West Surrey Regiment, bore a Paschal Lamb as its badge. From their colonel, Percy Kirke (q.v.), they were known as Kirke's Lambs. The exaggerated reputation of the regiment for brutality, both in Tangier and in England after Sedgemoor, lent irony to the nickname.

LAMBBALLE, MARIE THÉRÈSE LOUISE DE SAVOY-CARIGNANO, PRINCESSE DE (1750-1792), fourth daughter of Louis Victor de Carignano (d. 1774) (great-grandfather of King Charles Albert of Sardinia), and of Christine Henriette of Hesse-Rheinfels-Rothenburg, was born at Turin on the 3rd of November 1750. She was married to Louis Alexandre Stanislaus de Bourbon, prince of Lamble, son of the duke of Penthièvre, a grandson of Louis XIV.'s natural son the count of Toulouse. Her husband dying the following year, she retired with her father-in-law to Rambouillet, where she lived until the marriage of the
LAMBALLE—LAMBERT, D.
dauphin, when she returned to court. Marie Antoinette, charmed by her gentle and naive manners, singled her out for a companion and confidante. The impetuous character of the dauphiness found in Madame de Lamballe that submissive temperament which yields to force of environment, and the two became fast friends. After her accession Marie Antoinette, in spite of the king's opposition, had her appointed superintendent of the royal household. Between 1776 and 1785 the comtesse de Polignac succeeded in supplanting her; but when the queen tired of the avarice of the Polignacs, she turned again to Madame de Lamballe. From 1785 to the Revolution she was Marie Antoinette's closest friend and the pliant instrument of her caprices. She came with the queen to the Tuileries and as her salon served as a meeting-place for the queen and the members of the Assembly whom she wished to gain over, the people believed her to be the soul of all the intrigues. After a visit to England in 1791 to appeal for help for the royal family she made her will and returned to the Tuileries, where she continued her services to the queen until the 10th of August, when she shared her imprisonment in the Temple. On the 19th of August she was transferred to La Force, and having refused to take the oath against the monarchy, she was on the 3rd of September delivered over to the fury of the populace, after which her head was placed on a pike and carried before the windows of the queen.

See George Bertin, Madame de Lamballe (Paris, 1888); Austin Dobson, Four Frenchwomen (1890); B. C. Hardy, Princesse de Lamballe (1906); Sir F. Montefiore, The Secret Memoirs of the Royal Family of France...now first published from the Journal, Letters and Conversations of the Princesse de Lamballe (London, 2 vols., 1826) have since appeared in various editions in English and in French. They are attributed to Catherine Hyde, Marchioness Givon-Broglio-Solari, and are apocryphal.

LAMBALLE, a town of north-western France, in the department of Côtes-du-Nord, on the Gouessant 13 m. E.S.E. of St Brieuc by rail. Pop. (1906) 4347. Crowning the eminence on which the town is built is a beautiful Gothic church (13th and 14th centuries), once the chapel of the castle of the counts of Penthièvre. La Noue, the famous Huguenot leader, was mortally wounded in 1591 in the siege of the castle, which was dismantled in 1626 by Richelieu. Of the other buildings, the church of St Martin (11th and 12th centuries) is the chief. Lamballe has an important haras (deport for stallions) and carries on trade in grain, tanning and leather-dressing; earthenware is manufactured in the environs. Lamballe was the capital of the territory, the counts of Penthièvre, who in 1569 were made dukes.

LAMBEAUX, JEF (Joseph Marie Thomas), (1852-1908), Belgian sculptor, was born at Antwerp. He studied at the Academy of Fine Arts at Antwerp, under Hermet and Collignon. His first work, "War," was exhibited in 1871, and was followed by a long series of humorous groups, including "Children dancing," "Say 'Good Morning'" and "The Lucky Number" and "An Accident" (1875). He then went to Paris, where he executed for the Belgian salons "The Beggar" and "The Blind Pauper," and produced "The Kiss" (1881), generally regarded as his masterpiece. After visiting Italy, where he was much impressed by the works of Jean Bologne, he showed a strong predilection for effects of force and motion. Other notable works are his fountain at Antwerp (1886), "Robbing the Eagle's Eyrie" (1890), "Drunkenness" (1893), "The Triumph of Woman," "The Bitten Fawn" (which created a great stir at the Exposition Universelle at Liége in 1895), and "The Human Passions," a colossal marble bas-relief, elaborated from a sketch exhibited in 1889. Of his numerous busts may be mentioned those of Hendrik Conscience, and of Charles Bals, the burgomaster of Brussels. He died on the 6th of June 1908.

LAMBERMONT, AUGUSTE, BARON (1819-1905), Belgian statesman, was born at Dion-le-Val in Brabant on the 25th of March 1819. He came of a family of small farmer proprietors, who had held land during three centuries. He was intended for the priesthood and entered the seminary of Floreffe, but his energies claimed a more active sphere. He left the monastery for Louvain University. Here he studied law, and also prepared himself for the military examinations. At that juncture the first Carlist war broke out, and Lambermont hastened to the scene of action. His services were accepted (April 1858) and he was entrusted with the command of two small cannon. He also acted as A.D.C. to Colonel Durando. He greatly distinguished himself, and for his intrepidity on one occasion he was decorated with the Cross of the highest military Order of St Ferdinand. Returning to Belgium he entered the Ministry for Foreign Affairs in 1842. He served in this department sixty-three years. He was closely associated with several of the most important questions in Belgian history during the last half of the 19th century— notably the freeing of the Scheldt. He was one of the very first Belgians to see the importance of developing the trade of their country, and at his own request he was attached to the commercial branch of the foreign office. The tolls imposed by the Dutch on navigation on the Scheldt strangled Belgian trade, for Antwerp was the only port of the country. The Dutch had the right to make this levy under treaties going back to the treaty of Munster in 1648, and they clung to it still more tenaciously after Belgium separated herself in 1830-1831 from the united kingdom of the Netherlands—the London conference in 1839 fixing the toll payable to Holland at 1-50 florins (3s. per ton. From 1856 to 1863 Lambermont devoted most of his energies to the removal of this impediment. In 1856 he drew up a plan of action, and he prosecuted it with untiring perseverance until he saw it embodied in an international convention seven years later. Twenty-one powers and states attended a conference held on the question at Brussels in 1863, and on the 15th of July the treaty freeing the Scheldt was signed. For this achievement Lambermont was made a baron. Among other important conferences in which Lambermont took a leading part were those of Brussels (1874) on the usages of war, Berlin (1878-1885) on Africa and the Congo, and Brussels (1889) on Central African Affairs and the Slave Trade. He was joint reporter with Baron de Courcel of the Berlin conference in 1884-1885, and on several occasions he was chosen as arbitrator by one or other of the great European powers. But his great achievement was the freeing of the Scheldt, and in token of its gratitude the city of Antwerp erected a fine monument to his memory. He died on the 7th of March 1905.

LAMBERT, DANIEL (1770-1809), an Englishman famous for his great size, was born near Leicester on the 13th of March 1770, the son of the keeper of the jail, to which post he succeeded in 1791. About this time his size and weight increased enormously, and though he had led an active and athletic life he weighed in 1793 thirty-two stone (438 lb). In 1806 he resolved to profit by his notoriety, and resigning his office went up to London and exhibited himself. He died on the 21st of July of this year. He was 6 ft. 11 in. in height and weighed 526 stone (730 lb). His waistcoat, now in the Kings Lynn Museum, measures 102 in. round the waist. His coffin contained 112 ft. of elm and was built on wheels. His name has been used as a synonym for immensity. George Meredith describes London as the "Daniel Lambert of cities," and Herbert Spencer uses the phrase "a Daniel Lambert of learning." His enormous proportions were depicted on a number of tavern signs, but the best portrait of him, a large mezzotint, is preserved at the British Museum in Lysons's Collectanea.
LAMBERT, FRANCIS (c. 1486-1530), Protestant reformer, was the son of a papal official at Avignon, where he was born between 1485 and 1487. At the age of 15 he entered the Franciscan monastery at Avignon, and after 1517 he was an itinerant preacher, travelling through France, Italy and Switzerland. His study of the Scriptures shook his faith in Roman Catholic theology, and by 1522 he had abandoned his order, and became known to the leaders of the Reformation in Switzerland and Germany. He did not, however, identify himself either with Zwinglianism or Lutheranism; he disputed with Zwinglei at Zurich in 1522, and then made his way to Einsenach and Wittenberg, where he married in 1523. He returned to Strassburg in 1524, being anxious to spread the doctrines of the Reformers among the French-speaking population of the neighbourhood. By the Germans he was distrusted, and in 1526 his activities were prohibited by the city of Strassburg. He was, however, befriended by Jacob Sturm, who recommended him to the Landgraf Philip of Hesse, the most liberal of the German reforming princes. With Philip's encouragement he drafted the scheme of ecclesiastical reform for which he is famous. Its basis was essentially democratic and congregational, though it provided for the government of the whole church by means of a synod. Pastors were to be elected by the congregation, and the whole system of canon-law was repudiated. This scheme was submitted to Philip by a synod at Homburg; but Luther intervened and persuaded the Landgraf to abandon it. It was far too democratic to commend itself to the Lutherans, who had by this time bound the Lutheran cause to the support of princes rather than to that of the people. Philip continued to favour Lambert, who was appointed professor and head of the theological faculty in the Landgraf's newly founded university of Marburg. Patrick Hamilton (q.v.), the Scottish martyr, was one of his pupils; and it was at Lambert's instigation that Hamilton composed his Locis communis, or Patrick's Pleas as they were popularly called in Scotland. Lambert was also one of the divines who took part in the great conference of Marburg in 1529; he had long wavered between the Lutheran and the Zwinglian view of the Lord's Supper, but at this conference he definitely adopted the Zwinglian view. He died of the plague on the 18th of April 1530, and was buried at Marburg.

A catalogue of Lambert's writings is given in Haag's La France protestante. See also lives of Lambert by Baum (Strassburg, 1840); F. W. H. Wegelin (1838); F. H. Weisbach (1867); and Louis Ruffet (Paris, 1873); Lorimer, Life of Patrick Hamilton, Parts I and II (Glasgow, 1875); A. L. Richter, Die evangelischen Kirchenordnungen des 16. Jahrh. (Weimar, 1870); Hessencamp, Hessische Kirchenordnungen im Zeitalter der Reformation (Philip of Hesse's Correspondence with Bucer, ed. M. Lenz; Lindsay, Hist. Reformation; Altemeier's Deutsche Biographie. (A. F. P.)

LAMBERT, JOHANN HEINRICH (1728-1777), German physicist, mathematician and astronomer, was born at Mulhausen, Alsace, on the 26th of August 1728. He was the son of a tailor; and the slight elementary instruction he obtained at the free school of his native town was supplemented by his own private reading. He became book-keeper at Montbélier ironworks, and subsequently (1745) secretary to Professor Iselin, the editor of a newspaper at Basel, who three years later recommended him as private tutor to the family of Count A. von Salis of Coire. Thus Lambert came to virtual possession of a good library, and Lambert had peculiar opportunities for improving himself in his literary and scientific studies. In 1759, after completing with his pupils a tour of two years' duration through Göttingen, Utrecht, Paris, Marseilles and Turin, he resigned his tutorship and settled at Augsburg, Munich, Erlangen, Cologne, and Kaiserswerth, where he became for brief successive intervals his home. In 1764 he removed to Berlin, where he received many favours at the court of Frederick the Great and was elected a member of the Royal Academy of Sciences of Berlin, and in 1774 edited the Berlin Ephemeris. He died of consumption on the 25th of September 1777. His publications show him to have been a man of original and active mind with a singular facility in applying mathematics to practical questions.

His mathematical discoveries were extended and overshadowed by his contemporaries. His development of the equation \(x^2 + px = q\) in an infinite series was extended by Leonard Euler, and particularly by Joseph Louis Lagrange. In 1761 he proved the irrationality of \(\pi\); a simpler proof was given somewhat later by Legendre. The introduction of hyperbolic functions into trigonometry was also due to him. His geometrical discoveries are of great value, his Die freie Perspective (1759-1774) being a work of great merit. Astronomy was also enriched by his investigations, and he was led to several remarkable theorems on conics which bear his name. The most important are: (1) To express the time of describing an elliptic arc under the Newtonian law of gravitation in terms of the focal distances of the initial and final points, and the length of the chord joining them. (2) A theorem relating to the apparent curvature of the geocentric path of a comet.

Lambert's most important work, Pyrometria (Berlin, 1779), is a systematic treatise on heat, containing the records and full discussion of many of his own experiments. Worthy of special notice also are Photometria (Augsburg, 1760), Insigniores orbis cometa-rum proprietates (Augsburg, 1761), and Beiträge zum Gebrauche der Mathematik und deren Anwendung (4 vols., Berlin, 1765-1772). The Memoirs of the Berlin Academy from 1761 to 1784 contain many of his papers, which treat of such subjects as resistance of fluids, magnetism, comets, probabilities, the problem of three bodies, meteorology, &c. In the Acta Helvetica (1753-1760) and in the Mathematica eruditorum (1761-1772) he published contributions appear. In Bode's Jahrbuch (1776-1780) he discusses nutation, aberration of light, Saturn's rings and comets; in the Nova acta Helvetica (1787) he has a long paper "Sur le son des corps élastiques," in Bernoulli's Magazin (1787-1795) he treats of the roots of equation and of lineal and parabolic lines; and in Hindenburg's Archiv (1798-1799) he writes on optics and perspective. Many of these pieces were published posthumously. Recognized as among the first mathematicians of his day, he was also notable for his universality and depth of his philological and philosophical knowledge. The most valuable of his logical and philosophical memoirs were published collectivelly in 2 vols. (1782).

Lambert's Lambs' Leben und Wirken: M. Chasles, Geschichte der Geometrie; and Baensch, Lambert's Philosophie und seine Stellung zu Kant (1902).

LAMBERT [alias Nicholson], JOHN (d. 1538), English Protestant martyr, was born at Norwich and educated at Cambridge, where he graduated B.A. and was admitted in 1521 a fellow of Queen's College on the nomination of Catherine of Aragon. After acting for some years as a “mass-priest,” his views were unsettled by the arguments of Bilney and Arthur; and episcopal persecution compelled him, according to his own account, to assume the name Lambert instead of Nicholson. He likewise removed to Antwerp, where he became chaplain to the English factory, and formed a friendship with Frith and Tyndale. Returning to England in 1531, he came under the notice of Archbishop Warham, who questioned him closely on his religious beliefs. Warham's death in August 1532 relieved Lambert from immediate danger, and he earned a living for some years by teaching Latin and Greek near the Stocks Market in London. The duke of Norfolk and other reactionaries accused him of heresy in 1536, but reforming tendencies were still in the ascendancy, and Lambert escaped. In 1538, however, the reaction had begun, and Lambert was its first victim. He singled himself out for persecution by denying the Real Presence; and Henry VIII., who had just rejected the Lutheran proposals for a theological union, was in no mood to tolerate worse heresies. Lambert had challenged some views expressed by Dr John Taylor, afterwards bishop of Lincoln; and Cranmer as archbishop condemned Lambert’s opinions. He appealed to the kings supreme head of the Church, and on the 16th of November he heard the case in person before a large assembly of spiritual and temporal peers. Among the chief questions at issue was the doctrine of the Eucharist. At the same time the body of Christ, he was condemned to death by Cromwell as vicerect. Henry's consecration and patience produced a great impression on his Catholic subjects; but Cromwell is said by Foxe to have asked Lambert's pardon before his execution, and Cranmer eventually adopted the views he condemned in Lambert. Lambert was burnt at Smithfield on the 22nd of November.
LAMBERT, JOHN

(1619–1694), English general in the Great Rebellion, was born at Calton Hall, Kirkby Malham, in the West Riding of Yorkshire. His family was of ancient lineage, and long settled in the county. He studied law, but did not make it his profession. In 1639 he married Frances, daughter of Sir William Lister. At the opening of the Civil War he took up arms for the parliament, and in September 1642 was appointed a captain of horse in the army commanded by Ferdinand, Lord Fairfax. A year later he had become colonel of a regiment of horse, and he distinguished himself at the siege of Hull in October, 1643. Early in 1644 he did good service at the battles of Nantwich and Bradford. At Marston Moor Lambert’s own regiment was routed by the charge of Goring’s horse; but he cut his way through with a few troops and joined Cromwell on the other side of the field. When the New Model army was formed in the beginning of 1645, Colonel Lambert was appointed to succeed Fairfax in command of the northern forces. General Poynitz, however, soon replaced him, and under this officer he served in the Yorkshire campaign of 1645, receiving a wound before Pontefract. In 1646 he was given a regiment in the New Model, serving with Fairfax in the west of England. The next year, on the dissolution of the commission, with Cromwell and others for the surrender of Oxford in the same year. “It is evident,” says C. H. Firth (Dict. Nat. Biog.), “that he was from the first regarded as an officer of exceptional capacity and specially selected for semi-political employments.”

When the quarrel between the army and the parliament began, Lambert threw himself warmly into the army’s cause. He assisted Ireton in drawing up the several addresses and remonstrances issued by the army, both men having had some experience in the law, and being “of a subtle and working brain.” Early in August 1647 Lambert was sent by Fairfax as major-general to take charge of the forces in the northern counties. His wise and just managing of affairs in those parts is commended by Whitelocke. He suppressed a mutiny among his troops, kept strict discipline and hunted down the moss-troopers who infested the moordland country.

When the Scottish army under the marquis of Hamilton invaded England in the summer of 1648, Lambert was engaged in suppressing the Royalist rising in his district. The arrival of the Scots obliged him to retreat; but Lambert displayed such treachery and insubordination that the invaders till Cromwell came up from Wales and with him destroyed the Scottish army in the three days’ fighting from Preston to Warrington. After the battle Lambert’s cavalry headed the chase, pursuing the defeated army à outrance, and finally surrounded it at Uttoxeter, where Hamilton surrendered to Lambert on the 29th of August. He then led the advance of Cromwell’s army into Scotland, where he was left in charge on Cromwell’s return. From December 1648 to March 1649 he was engaged in the siege of Pontefract Castle; Lambert was thus absent from London at the time of Pride’s Purge and the trial and execution of the king.

When Cromwell was appointed to the command of the war in Scotland (July 1650), Lambert went with him as major-general and second in command. He was wounded at Musselburgh, but returned to the front in time to take a conspicuous share in the victory of Dunbar. He himself defeated the “Protesters” or “Western Whigs” at Hamilton, on the 1st of December 1650. In July 1651 he was sent into Fife to get in the rear and flank of the Scottish army near Falkirk, and force them to decisive action by cutting off their supplies. This mission, in the course of which Lambert won an important victory at Inverkeithing, was executed with entire success, whereupon Charles II., as Lambert had foreseen, made for England. For the events of the Worcester campaign, which quickly followed, see GREAT REBELLION. Lambert’s part in the general plan was carried out most brilliantly, and in the crowning victory of Worcester he commanded the right wing of the English army, and had his horse shot under him. Parliament now conferred on him a grant of lands in Scotland worth £1000 per annum.

In October 1651 Lambert was made a commissioner to settle the affairs of Scotland, and on the death of Ireton he was appointed lord deputy of Ireland (January 1652). He accepted the office with pleasure, and made magnificent preparations; parliament, however, soon afterwards reconstituted the Irish administration and Lambert refused to accept office on the new terms. Henceforward he began to oppose the Rump. In the council of officers he headed the party desiring representative government, as opposed to Harrison who favoured a selected oligarchy of “God-fearing” men, but both hated what remained of the Long parliament, and joined in urging Cromwell to dissolve it by force. At the same time Lambert was consulted by the parliamentary leaders as to the possibility of dismissing Cromwell from his command, and on the 13th of March 1653 Cromwell refused to see him, speaking of him contemptuously as “bottomless Lambert.” On the 20th of April, however, Lambert accompanied Cromwell when he dismissed the council of state, on the same day as the forcible expulsion of the parliament. Lambert now favoured the formation of a small executive council, to be followed by an elective parliament whose powers should be limited by a written instrument of government. Being at this time the ruling spirit in the council of state, and the idol of the army, there were some who looked on him as a possible rival of Cromwell for the chief executive power, while the royalists for a short time had hopes of his support. He was invited, with Cromwell, Harrison and Desborough, to sit in the nominated parliament of 1653; and when the unpopularity of that assembly increased, Cromwell drew nearer to Lambert. In November 1653 Lambert presided over a meeting of officers, when the question of constitutional settlement was discussed, and a proposal made for the forcible expulsion of the nominated parliament. On the 1st of December he urged Cromwell to assume the title of king, which the latter refused. On the 12th the parliament resigned its powers into Cromwell’s hands, and on the 13th Lambert obtained the consent of the officers to the Instrument of Government (q.v.), in the framing of which he had taken a leading part. He was one of the seven officers nominated to seats in the council created by the Instrument. In the foreign policy of the protectorate he was the most clamorous of those who called for alliance with Spain and war with France in 1653, and he firmly opposed Cromwell’s design for an expedition to the West Indies.

In the debates in parliament on the Instrument of Government in 1654 Lambert proposed that the office of protector should be made hereditary, but was defeated by a majority which included members of Cromwell’s family. In the parlament of this year, and again in 1656, Lord Lambert, as he was now styled, sat as member for the West Riding. He was one of the major-generals appointed in August 1655 to command the militia in the ten districts into which it was proposed to divide England, and who were to be responsible for the maintenance of order and the administration of the law in their several districts. Lambert took a prominent part in the committee of council which drew up instructions to the major-generals, and he was probably the originator, and certainly the organizer, of the system of police which these officers were to control. Gardiner conjectures that it was through divergence of opinion between the protector and Lambert in connexion with these “instructions” that the estrangement between the two men began. At all events, although Lambert had himself at an earlier date requested Cromwell to take the royal dignity, when the proposal to declare Oliver King was started in parliament (February 1657) he at once declared strongly against it. A hundred officers headed by Fleetwood and Lambert waited on the protector, and begged him to put a stop to the proceedings. Lambert was not convinced by Cromwell’s arguments, and their complete estrangement, personal as well as political, followed. On his refusal to take the oath of allegiance to the protector, Lambert was deprived of his commissions, receiving, however, a pension of
LAMBERT OF HERSFELD

£1,000 a year. He retired to his garden at Wimbledon, and appeared no more in public during Oliver Cromwell's lifetime; but shortly before his death Cromwell sought a reconciliation, and Lambert and his wife visited him at Whitehall. When Richard Cromwell was proclaimed protector he first difficulty lay with the army, over which he exercised no effective control. Lambert, though holding no military commission, was the most popular of the old Cromwellian generals with the rank and file of the army, and it was very generally believed that he would install himself in Oliver's seat of power. Richard's adherents tried to conciliate him, and the royalist leaders made overtures to him, even proposing that Charles II. should marry Lambert's daughter. Lambert at first gave a lukewarm support to Richard Cromwell, and took no part in the intrigues of the officers at Fleetwood's residence, Wallingford House. He was a member of the parliament which met in January 1659, and when it was dissolved in April under compulsion of Fleetwood and Desborough, he was restored to his commands. He headed the deputation to Lenthall in May inviting the return of the Rump, which led to the same retirement of Richard Cromwell into obscurity; and he was appointed a member of the committee of safety and of the council of state. When the parliament, desirous of controlling the power of the army, withheld from Fleetwood the right of nominating officers, Lambert was named one of a council of seven charged with this duty. The parliament's evident distrust of the soldiers caused much discontent in the army; while the entire absence of real authority encouraged the royalists to make overt attempts to restore Charles II., the most serious of which, under Sir George Booth and the earl of Derby, was crushed by Lambert near Chester on the 16th of August. He promoted a petition from his army that Fleetwood might be made lord-general and himself major-general. The republican party in the House took offence. The Commons (October 12th, 1659) cashiered Lambert and other officers of the army and the council of war. He was under the authority of the speaker. On the next day Lambert caused the doors of the House to be shut and the members kept out. On the 26th a "committee of safety" was appointed, of which he was a member. He was also appointed major-general of all the forces in England and Scotland, Fleetwood being general. Lambert was now sent with a large force to meet Monk, who was in command of the English forces in Scotland, and either negotiate with him or force him to terms. Monk, however, set his army in motion southward. Lambert's army began to melt away, and he was kept in suspense by Monk till his whole army fell from him and he returned to London almost alone. Monk marched to London unopposed. The "excluded" Presbyterian members were recalled. Lambert was sent to the Tower (March 3rd, 1660), from which he escaped a month later. He tried to rekindle the civil war in favour of the Commonwealth, but without success, and was recaptured and sent back to the Tower (April 24th). On the Restoration he was exempted from danger of life by an address of both Houses to the king, but the next parliament (1662) charged him with high treason. Thenceforward for the rest of his life Lambert remained in custody in Guernsey. He died in 1694.

Lambert would have left a better name in history if he had been a cavalry. His genial, ardent and excitable nature, easily raised and easily depressed, was more akin to the royalist than to the puritan spirit. Vain and sometimes overbearing, as well as ambitious, he believed that Cromwell could not stand without him; and when Cromwell was dead, he imagined himself enabled and fitted to succeed him. Yet his ambition was less selfish than that of Monk. Lambert is accused of no ill faith, no want of generosity, no cold and calculating policy. As a soldier he was far more than a fighting general and better than the great generals who preceded him; moreover, an able writer and speaker, and an accomplished negotiator and took pleasure in quiet and domestic pursuits. He learnt his love of gardening from Lord Fairfax, who was also his master in the art of war and government. He was known to have been "likeable and amiable", and was not infrequently bequeathed flowers, besides cultivating them, and incurred the blame of Mrs Hutchinson by " dressing his flowers in his garden and working at the needle with his wife and his maids." He made no special profession of religion; but no imputation is cast upon his moral character by his contemporaries. It has been said that he became a Roman Catholic before his death.

LAMBERT OF HERSFELD (d. c. 1088), German chronicler, was probably a Thuringian by birth and became a monk in the Benedictine abbey of Hersfeld in 1058. As he was ordained priest at Aschaffenburg he is sometimes called Lambert of Aschaffenburg, or Schafnaburg. He made a pilgrimage to the Holy Land, and visited various monasteries of his order: but he is famous as the author of some Annales. From the creation of the world until about 1040 these Annales are a jejune copy of other annals, but from 1040 to their conclusion in 1077 they are interesting for the history of Germany and the papacy. The important events during the earlier part of the reign of the emperor Henry IV., including the visit to Canossa and the battle of Hohenburg, are vividly described. Their tone is hostile to Henry IV. and friendly to the papacy; their Latin style is excellent. The Annales were first published in 1525 and are printed in the Monuments Germaniae Historica, Band II. and v. (Hanover and Berlin, 1826 fol.). Formerly Lambert's reputation for accuracy and impartiality was very high, but both qualities have been somewhat discredited.

Lambert is also regarded as the author of the Historia Hersfeldensis, the extant fragments of which are published in Band v. of the Monumenta of a Vita Ludik, Lullus, archbishop of Mainz, being the founder of the abbey Hersfeld; and of Carmen de bello Saxonico. His Opera have been edited with an introduction by O. Holder-Egger (Hanover, 1894).

Einleitung zu den neuen Quellenforschung (Cassel, 1896); L. von Ranke, Zur Kritik frankhisch-deutscher Reichsannalisten (Berlin, 1854); W. Wattenbach, Deutslands Geschichtsquellen Band ii. (Berlin, 1906) and A. Potthast, Bibliotheca Historica (Berlin, 1896).

LAMBESSA, the ancient Lambassa, a city of Algeria, in the arrondissement of Batna and department of Constantine, 7 m. S.E. of Batna and 17 w. of Tingad. The modern village, the centre of an agricultural colony founded in 1848, is noteworthy for its great convict establishment (built about 1850). The foundations of the Roman town and more especially of the Roman camp, in spite of wanton vandalism, are among the most interesting ruins in northern Africa. They are now preserved by the Service des Monuments historiques and excavations have resulted in many interesting discoveries. The ruins are situated on the lower terraces of the Jebel Aures, and consist of triumphal arches (one to Septimius Severus, another to Commodus), temples, aqueducts, vestiges of an amphitheatre, baths and an immense quantity of masonry belonging to private houses. To the north and east lie extensive cemeteries with the stones standing in their original alignments; to the west is a similar area, from which, however, the stones have been largely removed for building the modern village. Of the temple of Aesculapius only one column is standing, though in the middle of the 19th century its façade was entire. The capitol or temple dedicated to Jupiter, Juno and Minerva, which has been cleared of debris, has a portico with eight columns. On level ground about two thirds of a mile from the centre of the ancient town stands the camp, its site now partly occupied by the penitentiary and its gardens. It measures 1640 ft. N. to S. by 1476 ft. E. to W., and in the middle rise the ruins of a building commonly called, but incorrectly, the praetorium. This noble building, which dates from A.D. 268, is 92 ft. long by 66 ft. broad and 49 ft. high; its southern façade has a splendid peristyle half the height of the wall, consisting of a front row of massive Ionic columns and an engaged row of Corinthian pilasters. Behind this building (which was roofed), is a large court giving access to other buildings, one being the arsenal. In it have been found many thousands of projectiles. To the S.E. are the remains of the baths. The ruins of both city and camp have yielded many inscriptions (Renier edited 1500, and there are 4185 in the Corpus Inscrip. Lat. vol. viii.); and, though a very large proportion are epigraphs of the latest date, the more important pieces supply a vivid outline of the history of the place. Over 235 inscriptions relating to the camp have been deciphered. In a museum in the village are objects of antiquity discovered in the vicinity. Besides inscriptions, statues, &c., there are some fine mosaics found in 1905 near the arch of Septimius Severus. The statues include...
LAMBETH—LAMBETH CONFERENCES

those of Aesclapius and Hygiëa, taken from the temple of Aesculapius.

Lambeth was a military foundation. The camp of the third legion (Legio III, Augusta), to which it owes its origin, appears to have been established between A.D. 123 and 129, in the time of Hadrian, whose address to his soldiers was found inscribed on a pillar, a second camp on the west side of the present almshouses, dating by 166 mention is made of the decurions of a vicus, to curiae of which are known by name; and the vicus became a municipium probably at the time when it was made the capital of the newly founded province of Numidia. The legion was removed by Gordianus, but restored by Valerianus and Gallienus; and its final departure did not take place till after 392. The town soon afterwards declined. It never became the seat of a bishop, and no Christian inscriptions have been found here.

About 2 m. S. of Lambeth are the ruins of Markuna, the ancient Vercundia, including two triumphal arches.

LAMBETH, a southern metropolitan borough of London, England, bounded N.W. by the river Thames, N.E. by Southwark, E. by Camberwell and W. by Wandsworth and Battersea, and extending into the county of Middlesex. It was chartered in the 13th century, August 1291 (Rom. Pop. 1901) 301,895. The name is commonly confined to the northern part of the borough, bordering the river; but the principal districts included are Kennington and Vauxhall (north central), Brixton (central) and part of Norwood (south). Four road-bridges cross the Thames within the limits of the borough, namely Waterloo, Westminster, Lambeth and Vauxhall, of which the first, a fine stone structure, dates from 1817, and is the oldest Thames bridge standing within the county of London. The main thoroughfare runs S. from Westminster Bridge Road to Kennington Road, continuing as Brixton Road and Brixton Hill, Clapham Road branching S.W. from it at Kennington. Several thoroughfares also converge upon Vauxhall Bridge, and from a point near this down to Westminster Bridge the river is bordered by the fine Albert Embankment.

Early records present the name Lamb-hythe in various forms. The suffix is common along the river in the meaning of a haven, but the prefix is less clear; a Saxon word signifying mud is suggested. The name has a variety of spellings in the different documents, and in Vauxhall is concealed the name of Falkes de Brauté, an unscrupulous adventurer of the time of John and Henry III, exiled in 1325. The manor of North Lambeth was given to the bishopric of Rochester in the time of Edward the Confessor, and the bishops had a house here till the 16th century. They did not, however, retain the manor beyond the close of the 13th century, when it was acquired by the see of Canterbury. The palace of the archbishops is still here, and forms, with the parish church, a picturesque group of buildings, lying close to the river opposite the majestic Houses of Parliament, and to some extent joining with them to make of this reach of the Thames one of the finest prospects in London. The oldest part of the palace remaining is the Early English chapel. The so-called Lollard’s Tower, which retains evidence of its use as a prison, dates c. 1440. There is a fine Tudor gatehouse of brick, and the hall is dated 1663. The portion now inhabited by the archbishops was erected in 1834 and fronts a spacious quadrangle. Among the Official buildings are the archbishops’ houses; also Van Dyck, Hogarth and Reynolds. There is a valuable library.

The church of St Mary was rebuilt c. 1830, though the ancient monuments preserved give it an appearance of antiquity. Here are tombs of some of the archbishops, including Bancroft (d. 1610), and of the two Tradescants, collectors, and a memorial to Elias Ashmole, whose name is preserved in the Ashmolean Museum at Oxford University, to which he presented the collections of his friend the younger Tradescant (d. 1662). In the present Westminster Bridge Road was a circus, well known in the later 18th and early 19th centuries as Asley’s, and near Vauxhall Bridge were the celebrated Vauxhall Gardens.

The principal modern pleasure grounds are Kennington Park (20 acres), and Brockwell Park (127 acres) south of Brixton, and near the southern end of Kennington Road is Kennington Oval, the ground of the Surrey County Cricket Club, the scene of its home matches and of other important fixtures. Among institutions the principal is St Thomas’ Hospital, the extensive buildings of which front the Albert Embankment. The original foundation dated from 1225, was situated in Southwark, and was connected with the priory of Bermondsey. The existing buildings, subsequently enlarged, were opened in 1871, are divided into a series of blocks, and include a modern wing by Sir Charles Renier, for old men and women. Waterloo Road, the Lying-in Hospital, York Road, and the South-western fever hospital in Stockwell. There are technical institutes in Brixton and Norwood; and on Brixton Hill is Brixton Technical College, the most important of which is Scafell VICARIA and includes the well-preserved Doulton pottery works. The parliamentary borough of Lambeth has four divisions, North, Kennington, Brixton and Norwood, each returning one member. The borough council consists of a mayor, 10 aldermen and 60 councillors. Area, 4,080 acres.

LAMBETH CONFERENCES, the name given to the periodical assemblies of bishops of the Anglican Communion (Pan-Anglican synods), which since 1867 have met at Lambeth Palace, the London residence of the archbishop of Canterbury. The idea of these meetings was first suggested in a letter to the archbishop of Canterbury by Bishop Hopkins of Vermont in 1851, but the immediate impulse came from the colonial Church in Canada. In 1865 the synod of that province, in an urgent letter to the archbishop of Canterbury (Dr Longley), represented the unsettlement of members of the Canadian Church caused by recent legal decisions of the Privy Council, and their alarm lest the revived action of Convocation “should leave us governed by canons different from those in force in England and Ireland, and thus cause us to drift into the status of an independent branch of the Catholic Church.” They therefore requested him to call a “national synod of the bishops of the Anglican Church at home and abroad,” to meet under his leadership. After consulting both houses of the Convocation of Canterbury, Archbishop medallion, addressed at the Bishop of Chichester and the Anglican Communion (then 144 in number) to meet at Lambeth in 1867.

Many Anglican bishops (amongst them the archbishop of York and most of his suffragans) felt so doubtful as to the wisdom of such an assembly that they refused to attend it, and Dean Stanley declined to allow Westminster Abbey to be used for the closing service, giving as his reasons the partial character of the assembly, uncertainty as to the effect of its measures and “the presence of prelates not belonging to our Church.” Archbishop Longley said in his opening address, however, that they had no desire to assume “the functions of a general synod of all the churches in full communion with the Church of England,” but merely to “discuss matters of practical interest, and pronounce what we deem expedient in resolutions which may serve as safe guides to future action.” Experience has shown how valuable and wise this course was. The resolutions of the Lambeth Conferences have never been regarded as synodical decrees, but their weight has increased with each conference. Assumptions such as those which possessed the mind of Dean Stanley have long passed away.

Seventy-six bishops accepted the primate’s invitation to the first conference, which met at Lambeth on the 24th of September 1867, and sat for four days, the sessions being in private. The archbishop opened the conference with an address: deliberation followed; committees were appointed to report on special questions; resolutions were adopted, and an encyclical letter was addressed to the faithful of the Anglican Communion. Each of the subsequent conferences has been first received in Canterbury cathedral and addressed by the archbishop from the chair of St Augustine. It has then met at Lambeth, and after sitting for five days for deliberation upon the fixed subjects and appointment of committees, has adjourned, to meet again at the end of a fortnight and sit for five days more, to receive reports, adopt resolutions and to put forth the encyclical letter.

I. First Conference (September 24–28, 1867), convened and presided over by Archbishop Longley. The proposed order of subjects was entirely altered in view of the Colenso case, for which urgency was claimed; and most of the time was spent in discussing it. Of the thirteen resolutions adopted by the conference, two have direct
reference to this case; the rest have to do with the creation of new sees and missionary jurisdictions, commentator letters, and a "voluntary spiritual tribunal" in cases of doctrine and the due subordination of synods. The reports of the committees were not read, and the conference then adjourned.

II. Second Conference (July 2-27, 1878), convened and presided over by Archbishop Tait. On this occasion no hesitation appears to have been felt; 100 bishops were present, and the opening session was presided over by Archbishop Tait. Five special committees (based in part upon those of the committee of 1867) were embodied in the encyclical letter, viz., on the best mode of maintaining union, voluntary boards of arbitration, missionary history, and 2 are devoted entirely to the report of a committee on difficulties submitted to the conference.

III. Third Conference (July 3-27, 1888), convened and presided over by Archbishop Benson; 145 bishops present; the chief subject of the encyclical letter (viz., the "Church of Rome") was discussed, and one committee was appointed to consider the historic episcopate. In addition to the encyclical letter, nineteen resolutions were put forth, and the reports of twelve special committees are appended upon which they are based, the subjects being incompetence, purity, divorce, polygamy, observance of Sunday, socialism, care of emigrants, mutual relations of dioceses of the Anglican Communion, home reunion, Scandinavian Church, Old Catholics, &c., Eastern Churches, standards of doctrine and worship. Perhaps the most important of these is the famous "Lambeth Quadrilateral," which laid down a fourfold basis for home reunion—the Holy Scriptures, the Apostles' and Nicene creeds, the two sacraments ordained by Christ himself, and the historic episcopate.

IV. Fourth Conference (July 5-25, 1897), convened and presided over by Archbishop Benson, 194 bishops present. One of the chief subjects for consideration was the creation of a "tribunal of reference"; but the resolutions on this subject were weak and unimportant. The provision for the consolidation of bishops, and a more general resolution in favour of a "consultative body," was substituted. The encyclical letter is accompanied by sixty-three resolutions (which include careful provision for provincial organization, and a historic episcopate), and an archbishop, metropolitans, a "thankful recognition of the revival of brotherhoods and sisterhoods, and of the office of deacons," and a desire to promote friendly relations with the Eastern Churches and the various Orthodox bodies, and the reports of the eleven committees are subjoined.

V. Fifth Conference (July 6-August 5, 1908), convened by Archbishop Davidson, who presided; 241 bishops were present. The conference was occupied with the promotion of modern thought, the supply and training of the clergy, education, foreign missions, revision and "enrichment" of the Prayer-Book, the relation of the Church to "ministries of healing" (Christian Science, &c.), the questions of marriage and divorce, organization of the Anglican Church, reunion with other Churches. The results of the deliberations were embodied in seventy-eight resolutions, which were appended to the encyclical issued, in the name of the conference, by the archbishop of Canterbury.

The Lambeth conference, following as it did close on the great Pan- Anglican congress, is remarkably main on a proof of the growth of the influence and many-sided activity of the Anglican Church, and as an example of the organization of the Anglican Church, the seventy-eight resolutions none in any sense epoch-making, and their spirit is that of the traditional Anglican via media. In general they are characterized by a firm adherence to the fundamental ideas of Catholic orthodoxy, tempered by a tolerant attitude towards those not of the "household of the faith." The report of the committee on faith and modern thought is "a faithful attempt to show how the claim of our Lord Jesus Christ, which the Church is set to present to each generation, may be fulfilled in the characteristic conditions of our time, best command allegiance." On the question of education (Res. 11-19) the conference reaffirmed strongly the necessity for definite Christian teaching in schools, secular subjects being taught as well as possible, and as soon as possible, but not to compete with the religious instruction given in the Church's schools, and that the Church should carry on the teaching of the child. The resolutions on questions affecting foreign missions (20-26) deal with the overlapping of episcopal jurisdiction, the establishment of Anglican churches in foreign countries, and with the education of the natives, in connection with which the Church's mission to the " missions of healing" is advocated. The resolution on divorce (57-37) reaffirms the traditional attitude of the Church; it is, however, interesting to note that the resolution (40) on marriage and divorce is not included, and that divorce was carried only by eighty-seven votes to eighty-four. In resolutions 44 to 53 the conference deals with the duty of the Church towards modern democratic ideals and social problems; affirms the recognition of the "divorce of the Church" as a form of marriage and the Church's right to teach and concern in which their money is placed; "while frankly acknowledging the moral gains sometimes won by war" strongly supports the extension of international arbitration (52); and condemns "fifteen points of union." A question of reunion, the ideal of corporate unity was reaffirmed (58). It was decided to send a deputation of bishops with a letter of greeting to the national council of the Russian Church about to be assembled (60) and certain conditions were laid down for communion with certain of the Churches of the Orthodox Eastern Communion (62) and the "ancient separated Churches of the East" (63-66). Resolution 67 warned Anglicans from contracting marriages, under actual conditions, with Roman Catholics. By resolution 68 the conference stated its desire to maintain and strengthen the friendship of the Churches of England, the Church of Rome, the Church of Scotland, the Church of Ireland, and the Catholic Church and "the ancient Church of Holland" (Jansenist, see Utrecht) and the old Catholic Churches; and resolutions 70-73 made elaborate provisions for a projected corporate union between the churches of Spain and Portugal and the Anglican Church. As to "home reunion," however, it was made perfectly clear that this would only be possible on lines suggested by such precedents as those of 1610, i.e., by the Presbyterian Churches accepting the episcopal form of government. See also the organization of the Anglican Church.

LAMBURN, a market town in the Newbury parliamentary division of Berkshire, England, 53 m. W. of London, the terminus of the Lambourn Valley Light railway from Newbury. Pop. (1901) 2071. It lies high up the narrow valley of the Lambourn, a tributary of the Kennet famous for its trout-fishing, among the Berkshire Downs. The church of St Michael is cruciform and principally late Norman, but has numerous additions of later periods and has been considerably altered by modern restoration. The inmates of an almshouse founded by John Eastbury, c. 1500, by his desire still hold service daily at his tomb in the church. A Perpendicular market-cross stands without the church. The town has agricultural trade, but its chief importance is derived from large training stables in the neighbourhood. To the north of the town is a large group of tumuli known as the Seven Barrows, ascertained by excavation to be a British burial-place.

LAMONDI, formerly called "Lambini", the traditional patriarch, appears in each of the antediluvian logs. Gen. iv. 16-21 J., and Gen. v. P. In the former he is a descendant of Cain, and through his sons the author of primitive civilization; in the latter he is the father of Noah. But it is now generally held that these two genealogies are variant adaptations of the Babylonian list of primitive
LAMEGO—LAMELLIBRANCHIA

The nearest railway station is Peso da Regoa, on the opposite side of the Douro and on the Barca d’Alva-Oporto railway. Lamego is an ancient and picturesque city, in the midst of a beautiful mountain region. Its principal buildings are the 14th-century Gothic cathedral, Moorish citadel, Roman baths and a church which occupies the site of a mosque, and, though intrinsically commonplace, is celebrated in Portugal as the seat of the legendary cortes of 1143 or 1144 (see Portuguese History). The principal industries are viticulture and the rearing of swine, which furnish the so-called “Lisbon hams.” Lamego was a Moorish frontier fortress of some importance in the 9th and 10th centuries. It was captured in 1057 by Ferdinand I. of Castle and Leon.

LAMELLIBRANCHIA (Lat. lamella, a small or thin plate, and Gr. βραχχα, gills), the fourth of the five classes of animals constituting the phylum Mollusca (q.v.). The Lamellibranchia are mainly characterized by the rudimentary condition of the head, and the retention of the primitive bilateral symmetry, the latter feature being accentuated by the lateral compression of the body and the development of the shell as two bilaterally symmetrical plates or valves covering each one side of the animal. The foot is commonly a simple cylindrical or plough-share-shaped organ, used for boring in sand and mud, and more rarely provides a crawling surface similar to that of Gastropoda; or it may be an organ forming a tube for swimming. The paired ctenidia are very greatly developed right and left of the elongated body, and form the most prominent organ of the group. Their function is chiefly not respiratory but nutritive, since it is by the currents produced by their ciliated surface that food-particles are brought to the feebly-developed mouth and buccal cavity.

The Lamellibranchia present as a whole a somewhat uniform structure. The chief points in which they vary are—(1) in the structure of the ctenidia or branchial plates; (2) in the presence of one or of two chief muscles, the fibres of which run across the animal’s body from one valve of the shell to the other (adductors); (3) in the greater or less elaboration of the posterior portion of the mantle-skirt so as to form a pair of tubes, by one of which water is introduced into the sub-pallial chamber, whilst by the other it is expelled; (4) in the perfect or defective symmetry of the two valves of the shell and the connected soft parts, as compared with one another; (5) in the development of the foot as a disk-like crawling organ (Ares, Nucula, Pectunculus, Trigonia, Lepton, Galeomma), as a simple plough-like or tongue-shaped organ (Unionidae, &c.), as a re-curved salatory organ (Cardium, &c.), as a long burrowing cylinder (Solenidae, &c.), or as a cylindrical organ (polytelic tmesistic). The essential Molluscan organs are, with these exceptions, uniformly well developed. The mantle-skirt is always long, and hides the rest of the animal from view, its dependent margins meeting in the middle line below the ventral surface when the animal is retracted; it is, as it were, slit in the median line before and behind so as to form two flaps, a right and a left; on these the right and the left calcareous valves of the shell are borne respectively, connected by an uncalked part of the shell called the ligament. In many embryo Lamellibranchs a centro-dorsal primitive shell-gland or foliecle has been detected. The mouth lies in the median line anteriorly, the anus in the median line posteriorly.

Both ctenidia, right and left, are invariably present, the axis of each taking origin from the side of the body as in the scaphognath-Mollusc (see fig. 13). A pair of renal tubes opening right and left, rather far forward on the sides of the body, are always present. Each opens by its internal extremity into the pericardium. A pair of genital apertures, connected by genital ducts with the paired gonads, are found right and left near the nephridial pores, except in a few cases where the genital ducts join that of the renal organ (Spondylus). The gonads are often, but not always, distinct. No accessory glands or copulatory organs are ever present in Lamellibranchs. The ctenidia often act as brood-pouches.

A dorsal contractile heart, with symmetrical right and left auri ces receiving aerated blood from the ctenidia and mantle-
skirt, is present, being unequally developed only in those few forms which are inequivalve. The typical pericardium is well developed. It, as in other Mollusca, is not a blood-space but develops from the coelom, and it communicates with the exterior by the pair of renal tubes. As in Cephalopoda (and possibly other Mollusca) water can be introduced through the nephridia into this space. The alimentary canal keeps very nearly to the median vertical plane whilst exhibiting a number of flexures and loopings in this plane. A pair of large glandular outgrowths, the so-called "liver" or great digestive gland, exists as in other Mollusca. A pair of pedal oysts, and a pair of osphradia at the base of the gills, appear to be always present. A typical nervous system is present (fig. 10), consisting of a cerebro-pleural ganglion-pair, united by connectives to a pedal ganglion-pair and a visceral ganglion-pair (parieto-splanchnic).

A pyloric caecum connected with the stomach is commonly found, containing a tough flexible cylinder of transparent cartilaginous appearance, called the "cylindrical style" (Macra). In many Lamellibranchs a gland is found on the hinder surface of the foot in the mid line, which secretes a substance which sets into the form of threads—the so-called "byssus"—by means of which the animal can fix itself. Sometimes this gland is found in the young and not in the adult (Anodonta, Unio, Cyclas). In some Lamellibranchs (Pecten, Spondylus, Pholas, Macra, Tellina, Pectunculus, Galeomma, &c.), although cephalic eyes are generally absent, special eyes are developed on the free margin of the mantle-skip, apparently by the modification of tentacles commonly found there. There are no pores in the foot or elsewhere in Lamellibranchia by which water can pass into and out of the vascular system, as formerly asserted.

The Lamellibranchia live chiefly in the sea, some in fresh waters. A very few have the power of swimming by opening and shutting the valves of the shell (Pecten, Lima); most can crawl slowly or burrow swiftly; others crawl, when adults, permanently fixed to stones or rocks either by the shell or the byssus. In development some Lamellibranchia pass through a free-swimming trochosphere stage with preoral ciliated band; other fresh-

foot and gill where the probe $g$ passes. (6) Diagram to show the positions of the nerve-ganglia, heart and nephridia.

Letters in all the figures as follows:

$\text{a}$, Centro-dorsal area.
$\text{b}$, Margin of the left mantle-flap.
$\text{c}$, Margin of the right mantle-flap.
$\text{d}$, Excurrent siphonal notch of the mantle margin.
$\text{e}$, Incurrent siphonal notch of the mantle margin.
$\text{f}$, Protractor muscle of the foot.
$\text{g}$, Probe passed into the superior division of the sub-pallial chamber through the coelom, siphonal notches $d$, $e$, and issuing by the side of the foot into the inferior division of the sub-pallial chamber of the left foot.
$\text{h}$, Anterior (pallial) adductor muscle of the shells.
$\text{i}$, Anterior retractor muscle of the shell.
$\text{j}$, Protractor muscle of the foot.
$\text{k}$, Posterior (pedal) adductor muscle of the shells.
$\text{l}$, Posterior retractor muscle of the shell.
$\text{m}$, Anterior labial tentacle.
$\text{n}$, Posterior labial tentacle.
$\text{o}$, Base-line of origin of the right pallial and siphonal flaps from the side of the body.
$\text{p}$, Left external gill-plate.
$\text{q}$, Left internal gill-plate.
$\text{r}$, Inner lamella of the right inner gill-plate.
$\text{s}$, Right outer gill-plate.
$\text{t}$, Line of concrescence of the outer lamella of the left outer gill-plate with the left mantle-flap.
$\text{u}$, Pallial tentacles.
$\text{v}$, The thickened muscular pallial margin which adheres to the shell and forms the pallial line of the left shell.
$\text{w}$, That of the right side.
$\text{x}$, The mouth.
$\text{y}$, Aperture of the left organ of Bojanus (nephrostome), exposed by cutting the attachment of the inner lamella of the inner gill-plate.
$\text{z}$, Aperture of the genital duct.

Fig. 1.—Diagrams of the external form and anatomy of Anodonta cygnea, the Pond-Mussel; in figures 1, 3, 4, 5, 6 the animal is seen from the left side, the centro-dorsal region uppermost. (1) Animal removed from its shell in fig. 1 (1). The valves of the shell have been removed by severing their adhesions to the muscular areas $k$, $l$, $m$, $u$. The free edge of the left half of the mantle-skip $b$ is represented as a little contracted in order to show the exactly similar free edge of the right half of the mantle-skip $c$. These edges, though they touch, one another; each flap (right or left) can be freely thrown back in the way carried out in fig. 1 (5) for that of the left side. This is not always the case with Lamellibranchidae; there is in the group a tendency for the corresponding edges of the mantle-skip to fuse together by concrescence, and so to form a more or less completely closed bag, as in the Scaphopoda (Dentalium). In this way the notches $e$, $f$ of the hinder part of the mantle-skip of Anodonta are in the right side of the shell converted into two holes which project from the shell (figs. 6, 29). In such Lamellibranchidae as the oysters, scallops and many others which have the edges of the mantle-skip quite free, there are numerous tentacles upon those edges.
LAMELLIBRANCHIA

In *Anodonta* these pallial tentacles are confined to a small area surrounding the inferior siphonal notch (fig. 1 [3], 4). When the edges of the mantle ventral to the inhalent orifice are united, an anterior aperture is left for the protrusion of the foot, and thus there are three pallial apertures altogether, and adduccurrently relaxed, the edge of the ligament contracts, and the shells gape. It is on this account that the valves of a dead Lamellibranch always gape; the elastic ligament is not longer counteracted by the effort of the adductors. The state of closure of the valves of the shell is not, therefore, one of rest; when it is at rest—that is, when there is no muscular effort—the valves are held firmly closed by the elasticity of the ligament slightly gaping, and are closed by the action of the adductors when the latter are relaxed. The elastic ligament is simple in *Anodonta*; in many Lamellibranchs it is separated into blood and spermatic portions (fig. 4). When the valves of a shell are equal in *Anodonta* we find in many Lamellibranchs (Ostrea, Chama, Corbula, &c.) one valve larger, and the other smaller and sometimes flat, whilst the larger may be fixed to rocks or to stones (Corbula, &c.). A similar variation consists in the development of additional shell-plates upon the dorsal line between the two large valves (Pholadidae). In *Asperrimum* the two valves of the shell are united by a continuous, spongy, rubbery, and adductor muscle.

The shell of *Anodonta* does not present these parts in the most strongly marked condition, and accordingly our figures (figs. 2, 3, 4) represent the valves of the unipalliate genus *Cytheria*. The corresponding parts are recognizable in *Anodonta*. Reference (2, 3) for an explanation of terms applicable to the parts of the valve and the markings on its inner surface—corresponding to the muscular areas already noted on the surface of the animal's body—we must specially note here the position of that oblique line within the dorsal margin of the valve which is called the hinge (fig. 4). By this hinge one valve is closely fitted to the other. Below this hinge each shell becomes concave, above it each shell rises to form the umbo, and it is in this ridge-like upgrowth of each valve that the elastic ligament or spring is fixed (fig. 4). As shown in the diagram (fig. 5) representing a transverse section of the two valves of a Lamellibranch, the two shells form a double layer, of which thetoothed-hinge is the fulcrum. The adductor muscles placed in the concavity of the shells act upon the long arms of the lever at a mechanical advantage; their contraction keeps the shell shut, and stretches the ligament or spring. On the other hand, the ligament acts upon the short arm formed by the umbral ridge of the shell; its relaxation, the elastic resistance of the ligament, and the shape of the valves, cause the shell to open.

Fig. 5.—Diagram of a section of a Lamellibranch's valves, ligament, and adductor muscle.
Let us now examine the organs which lie beneath the mantle-skirt of *Anodonta*, and are bathed by the current of water which circulates through it. This can be done by lifting up and throwing back the left half of the mantle-skirt as is represented in fig. 1 (g). We thus expose the plough-like foot (f), the two left labial tentacles, and the two left gill-plates or left ctenidium. In fig. 1 (g), one of the labial tentacles t is also thrown back to show the mouth w, and the two left gill-plates are reflected to show the gill-plates of the right side (r, r') projecting behind the foot, the inner or median plate of each side being united by concrescence to its fellow of the opposite side along a continuous line (a). The left inner gill-plate is also snipped to show the subjacent orifices of the left renal organ x, and of the genital gland (testis or ovary) y. The foot thus exposed in *Anodonta* is a simple muscular tongue-like organ. It can be protruded between the flaps of the mantle (fig. 1 [1] [2]), so as to issue from the shell, and by its action the *Anodonta* can slowly crawl or burrow in soft mud or sand. Other Lamellibranchs may have a larger foot relatively than has *Anodonta*. In *Area* it has a similar surface. In *Area* too and many others it carries a byssus-forming gland and a byssus-cementing gland. In the cockles, in *Cardium*, and in *Trigonia*, it is capable of a sudden stroke, which causes the animal to jump when out of the water, in the latter genus to a height of four feet. In *Mytilus* the foot is reduced to little more than a tube-carrying the apertures of these glands. In the oyster it is absent altogether.

The labial tentacles or palps of *Anodonta* (n, in fig. 1 [3], [5]) are highly vascular flat processes richly supplied with nerves. The left anterior tentacle (seen in the figure) is joined at its base in front of the mouth (w) to the right anterior tentacle, and similarly the left (o) and right posterior tentacles are joined behind the mouth. Those of *Area* (t, k in fig. 9) show this relation to the mouth (o). These organs are characteristic of all Lamellibranchs; they do not vary except in size, being sometimes drawn out to streamer-like dimensions. Their appearance and position suggest that they are in some way related morphologically to the gill-plates, the anterior labial tentacle being a continuation of the outer gill-plate, and the posterior a continuation of the inner gill-plate. There is no embryological evidence to support this suggested connexion, and, as will appear immediately, the history of the gill-plates in various forms of Lamellibranchs does not directly favour it. The palps are really derived from part of the velar area of the larva.

The gill-plates have a structure very different from that of the labial tentacles, and one which in *Anodonta* is singularly complicated as compared with the condition presented by these organs in some other Lamellibranchs, and with what must have been their original condition in the ancestors of the whole series of living Lamellibranchs. The phenomenon of "concrrescence" which we have already had to note as showing itself so importantly in regard to the free edges of the mantle-skirt and the formation of the siphons, is what, above all else, marks the difference in the structure of the Lamellibranch ctenidium. Our present knowledge of the interesting series of modifications through which the Lamellibranch gill-plates have developed to their most complicated form is due to R. H. Peck, K. Mitsukuri, and W. G. Ridewood. The Molluscan ctenidium is typically a plume-like structure, consisting of a vascular axis, on each side of which is set a row of lamelliform or filamentous processes. These processes are hollow, and receive the venous blood from and may again aerated into, the hollow axis in which an afferent and an efferent blood-vessel may be distinguished. In the genus *Nucula* (fig. 10) we have an example of a Lamellibranch retaining this plume-like form of gill. In the Arcacea (e.g. *Area* and *Pectunculus*) the arterial processes which are set on the axis of the ctenidium are not lamellae, but are slightly flattened, very long tubes or filaments. These filaments are so fine and are set so closely together that they appear to form a continuous membrane until examined with a lens.

The microscope shows that the neighbouring filaments are held together by patches of cilia (fig. 11), which are called "ciliated junctions," which interlock with one another just as two brushes may be made to touch. In fig. 11 a portion of four filaments of a ctenidium of the sea-mussel (*Mytilus*) is represented, having precisely the same structure as those of *Area*. The filaments of the gill (ctenidium) of *Mytilus* and *Area* thus form two closely set rows which depend from the axis of the gill like two parallel filaments. Further, their structure is profoundly modified by the condition of the base, the free ends of the depending filaments. These are actually reflected at a sharp angle—doubled on themselves in fact—and thus form an additional row of filaments (see fig. 11 B). Consequently, each primitive filament has a descending and an ascending ramus, and instead of each row forming a simple single one is double, consisting of a descending and an ascending lamella. As the axis of the ctenidium lies by the side of the body, and is very frequently connate with the body, as so often happens in Gastropods also, we find that the two rows of filaments formed on each ctenidial axis as the outer and the inner gill-plate; each of these is composed of two lamellae, an outer (the reflected) and an axial in the case of the outer gill-plate, and an adaxial and hypobranchial in the case of the inner gill-plate. This is the condition seen in *Area* and *Mytilus*, the so-called plates dividing up the slightest touch into their constituent filaments, which butt on one another形成 extensive outgrowths called "interlaminal junctions" (d, j, in fig. 11). Complications follow upon this in other forms. Even in *Mytilus* and *Area* a connexion is here and there formed between the ascending and descending rami of a filament (fig. 12, a), by which the so-called trellis-work or lamella filaments are formed. This is not uncommon when the lamella tissues are not very different from those of the siphons. But generally he is formed by that the lamella filaments are so called interlaminal. If we suppose, as in the genus *Dreissena*—agenus not as far removed from *Mytilus*—that the ciliated inter-lamellar filaments (fig. 12) give place to solid permanent inter-lamellar junctions, so the trellis-work of filaments would be united so as to leave only a narrow-like set of spaces in their place. Within the trelisswork of the sponge-work blood channels, and between the water passes, having entered by the apertures left in the trellis-work formed by the united gill-filaments (fig. 14). The larger the
Intramellar spongy growth becomes, the more do the original gill-filaments lose the character of blood-holding tubes, and tend to become dense elastic rods for the simple purpose of supporting the spongy growth. This is seen both in the section of _Dreissensia_ gill (fig. 12) and in those of _Anodonta_ (fig. 13, A, B, C). In the drawing of _Dreissensia_ the individual filaments _f_ are cut across in one lamella at the filament. Although the structure of the ctenidium is thus highly complicated in _Anodonta_, it is yet more so in some of the siphonate genera of Lamellibranchs. The filaments take on a secondary grouping, the surface of the lamella being thrown into a series of half-cylindrical ridges, each consisting of ten or twenty filaments; a filament of much greater strength and thickness than the others may be placed between each pair of groups. In _Anodonta_, as in many other Lamellibranchs, the ova and hatched embryos are carried for a time in the ctenidium or gill apparatus, and in this particular case the space between the two lamellae of the outer gill-plate is that which serves to receive the ova (fig. 13, A). The young are nourished by a substance formed by the cells which cover the spongy inter-lamellar outgrowths.

Other points in the modification of the typical ctenidium must be noted in order to understand the ctenidium of _Anodonta_. The axis of each ctenidium, right and left, starts from a point well forward near the labial tentacles, but it is at first only a ridge, and does not project as a free cylindrical axis until the back part of the foot is reached. This is difficult to see in _Anodonta_, but if the mantle-skin is entirely cleared away, and if the dependent lamellae which spring from the ctenidial axis be carefully cropped so as to leave the axis intact, we obtain the form shown in fig. 15, where _g_ and _h_ are respectively the left and the right ctenidial axes, projecting freely beyond the body. In _Arca_ this can be seen with far less trouble, for the filaments are more easily removed than are the consolidated lamellae formed by the filaments of _Anodonta_, and in _Arca_ the free axes of the ctenidia are large and firm in texture (fig. 9, c, d).

If we were to make a vertical section across the long axis of a Lamellibranch which had the axis of its ctenidium free from its origin onwards, we should find such relations as are shown in the diagram fig. 16, A. The gill axis of _d_ is seen lying in the sub-pallial chamber between the foot _b_ and the mantle _c_. From it depend the gill-filaments or lamellae—formed by united filaments—drawn as black lines _f_. On the left side these lamellae are represented as having only a small reflected growth, on the right side the reflected ramus or lamella is complete (fr and er). The actual condition in _Anodonta_ at the region where the gills begin anteriorly is shown in fig. 16, B. The axis of the ctenidium is seen to be adherent to, or fused with the body-wall, and moreover on each side the outer lamella of the outer gill-plate is fused to the mantle, whilst the inner lamella of the inner gill-plate is fused to the foot. If we take another section nearer the hinder margin of the foot, we get the arrangement

shown diagrammatically in fig. 16, C, and more correctly in fig. 17. In this region the inner lamellae of the inner gill-plates are no longer affixed to the foot. Passing still farther back behind the foot, we find in Anodonta the condition shown in the section D, fig. 16. The axes of the inner lamellae of the inner gill-plates (er) still adhere by concrescence to the mantel-skirt, whilst the inner lamellae of the inner gill-plates meet one another and fuse by concrescence at L. In the lateral view of the animal with reflected mantle-skirt and gill-plates, the line of concrescence of the inner lamellae of the inner gill-plates is readily seen; it is marked by, in fig. 1 (5). In the same figure the free part of the inner lamella of the inner gill-plate resting on the foot is marked s, whilst the attached part—the most anterior—has been snipped with scissors so as to show the general and nephridial apertures x and y. The concrescence, then, of the free edge of the reflected lamella of the gill-plates of Anodonta is very extensive. It is important, because such a concrescence is by no means universal, and does not occur, for example, in Mytilus or in Arca; further, because when its occurrence is not appreciated, the reduction of the gill-plates of Anodonta to the plum-type of the simplest ctenidium presents no difficulty; and lastly, it has importance in reference to its physiological significance. The mechanical result of the concrescence of the outer lamellae to the mantle-flap, and of the inner lamellae to one another as shown in section D, fig. 16, is that the sub-pallial space is divided into two spaces by a horizontal septum. The upper space (i) communicates with the outer world.
LAMELLIBRANCHIA

by the excurrent or superior siphonal notch of the mantle (fig. 1, d); the lower space communicates by the lower siphonal notch (e in fig. 1). The only communication between the two spaces, excepting through the trellis-work of the gill-plates, is by the slit (e in fig. 1 (g)) left by the non-concrescence of a part of the inner lamella of the inner gill-plate with the floor. A probe (g) is introduced through this slit-like passage, and it is seen to pass out by the excurrent siphonal notch. It is through this passage, or indirectly through the pores of the gill-plates, that the water introduced into the lower sub-pallial space must pass on its way to the excurrent siphonal notch. Such a subdivision of the pallial chamber and direction of the currents set up within it do not exist in a number of Lammelibranchs which have the gill-lamellae comparatively free (Mytilus, Arca, Trigonia, &c.), and it is in these forms that there is less modification by concrescence of the primary filamentous elements of the lamellae.

In the 9th edition of this Encyclopaedia Professor (Sir) E. K. Lankester suggested that these differences of gill-structure would furnish characters of classificatory value, and this suggestion has been followed out by Dr Paul Pelseneer in the classification now generally adopted.

The alimentary canal of Anodonta is shown in fig. 1 (g). The mouth is placed between the anterior adductor and the foot: the anus opens on a median papilla overlying the posterior adductor, and discharges into the superior pallial chamber along which the excurrent stream passes. The coil of the intestine in Anodonta is similar to that of other Lammelibranchs. The rectum traverses the pericardium, and has the ventricle of the heart wrapped, as it were, around it. This is not an unusual arrangement in Lammelibranchs, and a similar disposition occurs in some Gastropoda (Halosita). A pair of ducts (a and b) lead from the first enlargement of the alimentary tract called stomach into a pair of large digestive glands, the so-called liver, the branches of which are closely packed in this region (g). The food of the Anodonta, as of other Lammelibranchs, consists of microscopic animal and vegetable organisms, brought to the mouth by the stream which sets into the sub-pallial chamber at the lower siphonal notch (e in fig. 1). Probably a straining of water from solid particles is effected by the lattice-work of the gill-plates.

The heart of Anodonta consists of a median ventricle embracing the rectum (fig. 18, A), and giving off an anterior and a posterior artery,
It does not contain blood or communicate directly with the blood-system; this isolation of the pericardium we have noted already in Gastropods and Cephalopods. A good case for the examination of the question as to whether blood enters the pericardium of Lamellibranchs could be escaped by the foot, or the whole animal suddenly contracts, is furnished by the Ceratulids legum, which has red blood-corpuscles. According to observations made by Penrose on an uninjured Ceratulids legum, no red corpuscles are to be found in the pericardial space, although the heart is filled with them, and no such corpuscles are ever discharged by the animal when it is irritated.

The pair of renal organs of Anodonta, called in Lamelli-

branchs the organs or nephridia, lie below the membranous floor of the pericardium, and open into it by two well-marked apertures, A and B. Each nephridium, after being bent upon itself as shown in fig. 18, C, D, opens to the exterior by a pore placed at the point marked x in fig. 1 (5) (6). One half of each nephridium is of a dark-green colour and glandular (fig. 18). This opens into the reflected portion which overlies it as shown in the diagram fig. 18. D, E; the latter has non-glandular walls, and opens by the pore k to the exterior. The renal organs may be more ramified in other Lamellibranchs than they are in Anodonta. In some they are difficult to discover. That of the common oyster was described by Hook. Each nephridium in the oyster is a pyramidal sac, which communi-

rates with a tube or a narrow canal with the pericardium. From all parts of the pyramidal sac narrow stalk-like tubes are given off, ending in abundant, widely-spread, glandular caeca, which form the essential renal secreting apparatus. The genital duct opens by a pore into the urino-gential groove of the oyster (the same arrangement being repeated on each side of the body) close but distinct from the aperture of the nephridium. Hence, except for the formation of a urino-gential groove, the apertures are placed as they are in Anodonta. Previously to Hook’s discovery a brown-coloured investment of the urino-gentials is supposed to represent the nephridia in a rudimen-

tary state. This investment, which occurs also in many Filibranchs, forms the pericardial glands, comparable to the pericardial accessory glandular growths of Cephalopoda. In Ostronidae and several other forms the pericardial glands are extended into diverticula of the pericardium which penetrate the mantle and constitute the organ of Heber.

The glands secrete hepatic acid which passes from the pericardium into the renal canal.

Nervous System and Sense-Organes.—In Anodonta there are three well-developed pairs of nerve ganglia (fig. 19, B, and fig. 1 (6)). A, an anterior ganglion-pair, is united as one on each side of the mouth (fig. 19, B, a) and connected in front of it by a commissure, are the representa-
tives of the cerebral and pleural ganglia of a typical Mollusca, which are formed by the ganglion-pair, united, as in Gastropods and in the pericardium. A pair placed close together in the foot (fig. 19, B, b, and fig. 1 (6), a) are the typical pedal ganglia, or peduncular ganglia, or pleural ganglia by connectives.

Posteriorly beneath the posterior adductors, and covered only by a thin layer of elongated epidermal cells, are the visceral ganglia. United with these ganglia on the left side of the body is a gland, above which the epithelium is modified to form a pair of sense-organes, corresponding to the ophradia of other Molluscs. In some Lamellibranchs the ophradial ganglia receive nerve-fibres, but from the visceral ganglia, but from the visceral ganglia and not from the cerebral ganglia in the customary way. In Anodonta the cerebral and the visceral are distinct, each giving origin to its own connective which runs to the pedal ganglion. The cerebral

ganglia, which are glandular, giving rise to a pedal gland. The cerebral

pedal and pleuro-pedal connectives, however, in these cases are only separate in the initial parts of their course, and unite together for the lower half of their length, or for nearly the whole length. Moreover, in many forms, in which in the adult condition there is only a single pair of anterior ganglia and a single pleural ganglion, a cerebral ganglion distinct from the cerebral has been recognized in the course of development. There is, however, no evidence of the union of a visceral pair with the cerebro-pleural.

The sense-organes of Anodonta other than the ophradia consist of a pair of otoconias attached to the pedal ganglion (fig. 1 (6), ay). The otoconia of Cyclas are peculiarly favourable for study on account of the transparency of the small foot in which they lie, and may be taken as typical of those of Lamellibranchs generally. The structure of

Fig. 19.—Nerve-ganglia and Cords of three Lamellibranchs. (From Gegenbaur.)

The urino-gential groove placed to the front of the great adductor muscle; by a second narrow canal it communicates with the pericardium. From all parts of the pyramidal sac narrow stalk-like tubes are given off, ending in abundant, widely-spread, glandular caeca, which form the essential renal secreting apparatus. The genital duct opens by a pore into the urino-gential groove of the oyster (the same arrangement being repeated on each side of the body) close but distinct from the aperture of the nephridium. Hence, except for the formation of a urino-gential groove, the apertures are placed as they are in Anodonta. Previously to Hook’s discovery a brown-coloured investment of the urino-gentials is supposed to represent the nephridia in a rudimentary state. This investment, which occurs also in many Filibranchs, forms the pericardial glands, comparable to the pericardial accessory glandular growths of Cephalopoda. In Ostronidae and several other forms the pericardial glands are extended into diverticula of the pericardium which penetrate the mantle and constitute the organ of Heber. The glands secrete hepatic acid which passes from the pericardium into the renal canal.

Nervous System and Sense-Organes.—In Anodonta there are three well-developed pairs of nerve ganglia (fig. 19, B, and fig. 1 (6)). A, an anterior ganglion-pair, is united as one on each side of the mouth (fig. 19, B, a) and connected in front of it by a commissure, are the representatives of the cerebral and pleural ganglia of a typical Mollusca, which are formed by the ganglion-pair, united, as in Gastropods and in the pericardium. A pair placed close together in the foot (fig. 19, B, b, and fig. 1 (6), a) are the typical pedal ganglia, or peduncular ganglia, or pleural ganglia by connectives.

Posteriorly beneath the posterior adductors, and covered only by a thin layer of elongated epidermal cells, are the visceral ganglia. United with these ganglia on the left side of the body is a gland, above which the epithelium is modified to form a pair of sense-organes, corresponding to the ophradia of other Molluscs. In some Lamellibranchs the ophradial ganglia receive nerve-fibres, but from the visceral ganglia, but from the visceral ganglia and not from the cerebral ganglia in the customary way. In Anodonta the cerebral and the visceral are distinct, each giving origin to its own connective which runs to the pedal ganglion. The cerebral

ganglia, which are glandular, giving rise to a pedal gland. The cerebral

and very frequently some of these tentacles have undergone a special metamorphosis converting them into highly-organized eyes. Such eyes on the mantle-edge of Anodonta and Spondylus, Lima, Penna, Pectunculus, Modula, Cardium, Tellina, Macro, Venus, Solis, Pholas and Galeomma. They are totally distinct from the cephalic eyes of typical Mollusca, and have a different structure and historical development. They have originated not as pits but as tentacles. They agree with the dorsal eyes of Onidium (Pulmonata) in the curious fact that the optic nerve penetrates the capsule of the eye and passes in front of the retinal body (fig. 21), so that its fibres join the anterior faces of the nerve-end cells as in Vertebrates, instead of their posterior faces as in the cephalic eyes of Mollusca and Arthropoda; moreover, the lens is not a cuticular product but a cellular structure, which, again, is a feature of agreement with the Vertebrate
LAMELLIBRANCHIA

eye. It must, however, be distinctly borne in mind that there is a fundamental difference between the eye of Vertebrates and of all other groups in the fact that in the Vertebrata the retina is itself a part of the central nervous system, and not a separate
pigmented epithelial fossa containing a cuticular linc. In the Arctidae the pallial eyes are compound or faceted somewhat like those of Arthropods.

Generative Organs.—The gonads of Anodonta are placed in distinct male and female individuals. In some Lamellibranchs—for instance, the European Oyster and the Pisidium pusillum—the sexes are united in the same individual; but here, as in most hermaphroditic animals, the two sexual elements are not ripe in the same individual at the same moment. It has been conclusively shown that the Ostrea edulis does not fertilize itself. The American Oyster (O. virginiana) and the Portuguese Oyster (O. angulata) have the sexes separate, and fertilization is effected in the open water after the discharge of the ova and the spermatzoa from the females and males respectively. In the Ostrea edulis fertilization of the eggs is effected at the moment of their escape from the uro-genital groove, or even before, by means of spermatzoa drawn into the sub-pallial chamber by the incumbent ciliary stream, and the embryos pass through the early stages of development whilst entangled between the gill-lamellae of the female parent (fig. 23). In Anodonta the eggs pass into the space between the two lamellae of the larval gill-plate, and are then fertilized, and advance whilst in this position to the glochidium phase of development (fig. 22). They may be found here in thousands in the summer and autumn months. The gonads themselves are extremely simple arborosect glands which open to the exterior by two simple ducts, one right and one left, contiguous with the tubular branches of the gonads. In the most primitive Lamellibranchs there is no separate generative aperture but the gonad discharge into the renal chamber, as in Patella among Gastropods. This is the case in the Protobranchia, e.g. Solenomya, in which the gonad opens into the reno-arterial duct. But the generative products do not pass through the whole length of the renal tube: there is a duct opening into the renal chamber, and the spermatzoa are pushed out, and the ova or sperms pass through this. In Arca, in Anomidae and in Pectinidae the gonad opens into the external part of the renal tube. The next stage of modification is shown in Ostrea, Cyclas and some Lucinidae, in which the generative and renal ducts

open into a cloacal slit on the surface of the body. In Mytilus the two apertures are on a common papilla, in other cases the two apertures are as in Anodonta. The Anatinae and Poromya among the Sepiolibranchs are, however, peculiar in having two genital apertures on each side, one male and one female. These forms are hermaphroditic, with an ovary and testis completely separate from each other on each side of the body, each having its own duct and aperture.

The development of Anodonta is remarkable for the curious larval form known as glochidium (fig. 22). The glochidium quits the gill-pouch of its parent and swims by alternate opening and shutting of the valves of its shell, as do adult Pecten and Lima, trailing at the same time a long byssus thread. This byssus is not homologous with
An extraordinary modification of the veliger occurs in the development of Nucula and Yoldia and probably other members of the same families. After the formation of the gastrula by epiboly the larva becomes enclosed by an ectodermic test covering the whole of the original mantle surface, and at the posterior end of the test is cast out, leaving only a small opening at the posterior end in which the stomodeum and proctodaeum are formed. In Yoldia and Nucula proxima the test consists of five rows of flattened cells, the three median rows bearing cilia, and the lateral rows of long cells. At the anterior end of the test is the apical plate of the centre of which projects a long flagellum as in many other Lamellibranch larvae. In Nucula delphinoides the test is uniformly covered with short cilia, and there is no flagellum. When the veliger has been cast off, its cells breaking apart and falling to pieces leaving the young animal with a well-developed shell exposed and the internal organs in an advanced stage. The test is really a ciliated velum developed in the normal position at the anterior end, but reflected backwards in such a way as to cover the original ectoderm except at the posterior end. In Yoldia and Nucula proxima the ova are set free in the water and the test-larvae are free-swimming, but in Nucula delphinoides the test-velum is not cast out, so that the young animal is enclosed in the apical plate of the centre of which projects a long flagellum.

**CLASSIFICATION OF LAMELLIBRANCHIA**

The classification originally based on the structure of the gills by P. Pelseneer included five orders, viz.: the Probrotanchia in which the gill-filaments are flattened and not reflected; the Filibranchia in which the filaments are long and reflected, with non-vascular junctions; the Pseudo-lamellibranchia in which the gill-lamellae are vertically folded, the interfilament and interlamellar junctions being vascular or non-vascular; the Eulamellibranchia in which the interfilament and interlamellar junctions are vascular; and lastly the Sephtibranchia in which the gills are reduced to a horizontal partition. The Pseudolamellibranchia included the oyster, scallop and allied molluscs which formerly constituted the order Mytilacea, having only a single large adductor muscle or in addition a very small anterior adductor.

The researches of W. G. Ridewood have shown that in gill-structure the Pectinacea agree with the Filibranchia and the Ostreaeacea with the Eulamellibranchia, and accordingly the order Pseudolamellibranchia is now suppressed and its members divided between the two other orders mentioned.

The four orders now retained exhibit successive stages in the modification of the ctenidia by reflection and concrescence of the filament, but other organs, such as the heart, adductors, renal organs, may not show corresponding stages. On the contrary considerable differences in these organs may occur within any single order. The Probrotanchia, however, possess several primitive characters besides that of the branchiae. In them the foot has a flat ventral surface used for creeping, as in Gastropods, the byssus gland in the posterior two-thirds of the foot and the byssus gland in the remaining third is associated with the shell-bearing part of the byssus gland, the byssus gland in the posterior two-thirds of the foot is provided with a posterior appendage; branchial filaments transverse; shell has an angular dorsal border; mantle open along its whole border, Nucula. Acida, Pronucula.

**Order I. PROBROTANCHIA**

In addition to the characters given above, it may be noted that the mantle is provided with a hypobranchial gland on the outer side of each gill, the ariole is muscular, the kidneys are glandular through their whole length, the sexes are separate.

**Fam. 1. Solenomyidae.**—One row of branchial filaments is directed forwards, the posterior border of each gill is prolonged to a suture and a single posterior aperture; the labial palps of each side are fused together; hinge without teeth; periostracum thick. Solenomya. Yoldia. Pronucula. Nucula. Adductor; larvae and posterior surtetrals.
LAMELLIBRANCHIA

Fam. 4. Ctenodontaidea.—Extinct; Silurian.

The fossil group Palaeeconcha is connected with the Proto-
branchia through the Solenomyidae. It contains the following extinct
families.

Fam. 1. Pracardiidae.—Shell equivale with hinge dentition as in
Arca. Protacaridium; Silurian and Devonian.

Fam. 2. Antipleuridae.—Shell inequivalve. Antipleurus; Silurian.

Fam. 3. Cardioididae.—Shell equivale and ventricose; hinge
without; P.C. Cath. Devonian.

Fam. 4. Grammysiidae.—Shell thin, equivale, oval or elongate;
hinge without. Grammysia; Silurian and Devonian.

Fam. 5. Vlastidae.—Shell very inequivalve; hinge without teeth.

Vlata; Silurian.

Fam. 6. Solenopsidae.—Shell equivale, greatly elongated, um-
bones very far forward. Solenops; Devonian to Trias.

Order II. FILIBRANCHIA

Gill-filament ventrally directed and reflected, connected by
cilated junctions. Foot generally provided with a highly
developed byssogenous apparatus.

Sub-order I.—Anomiacea.

Very asymmetrical, with a single large posterior adductor. The
heart is not contained in the pericardium. Devon or near the
Devonian, and gives off a single aorta anteriorly. The reflected borders of
the inner gill-plates of either side are fused together in the middle line.
The gonads open into the kidneys and the right gonad extends into
the mantle. Shell thin, animal fixed.

Fam. 1. Anomiidae.—Foot small; right (or) valley of adult
perforated to allow passage of the byssus. Anoma; byssus large and calcifie; British. Phanaria; byssus atrophied in adult.

Fam. 2. Paradendididae.—Shell as in Arca, but the posterior
hinge teeth elongated and parallel to the cardinal border.

Cucullaea; recent and fossil from the Jurassic. All the other genera
are fossil: Parallelodon; Devonian to Tertiary. Car-
boniferous; Carboniferous, &c.

Fam. 3. Limopsidae.—Shell orbicular, hinge curved, ligament
longer transversely than antero-posteriorly; foot elongate,
pointed anteriorly and posteriorly. Limops; Trinacria; Tertiary.

Fam. 4. Phylododyidae.—Shell thin, very inequivaler, anterior part
atrophied, umbones projecting. Phylodody.

Fam. 5. Cyrtodontaidea.—Extinct; shell equivale and inequi-
valer; anterior and posterior. Cyrtodonta; Silurian and Devonian.

Fam. 6. Trigoniidae.—Shell thick; foot elongated, pointed in
front and behind, ventral border sharp; byssus absent. Tri-
gonia; shell sub-triangular, umbones directed backwards.

This genus was very abundant in the Secondary epoch, especially
in Jurassic seas. There are six living species, all in Australian
seas. Living specimens were first discovered in 1827. Schiz-
opus; Mytilus; Mytella; Trias.

Fam. 7. Lyrodomyidae.—Extinct; shell inequivaler, posterior
side shorter; hinge short, teeth in form of a fan. Lyrodomesia;
Silurian.

Sub-order III.—Mytilacea.

Symmetrical, the anterior adductor small or absent. Heart gives
off only an anterior aorta. Surface of gills smooth, gill-filaments all
similar, with interlamellae junctions. Gonads generally extend into
mantle and open at sides of kidneys. Foot linguliform and byssiferous.

Fam. 1. Mytilidae.—Shell inequivaler, anterior end short;
hinge without; mantle has posterior suture. Cephalic eyes present. Mytilus; British. Modiolus;

Fam. 2. Rhatidae.—Shell inequivaler, anterior and posterior to
Cretaceous; adductor muscles sub-equal. Modiolopsis; Modiolomorpha. Myo-
concha.

Fam. 3. Pteroidea.—Shell very inequivaler; ligament sub-
acute and the mantle open throughout; anterior adductor absent.

Trias to Eocene. Odontoperna. Trias. Inconerous; Jurassic to Cretaceous.

Sub-order IV.—Pectinea.

Monomyarian, with open mantle. Gills folded and the filament
at summits and bases of the folds are different from
those. Gonads contained in the visceral mass and generally open into renal
cavities. Foot usually rudimentary.

Fam. 1. Vulsellidae.—Shell high; hinge toothless; foot
without byssus. Vulsella.

Fam. 2. Drellidae.—Shell very inequivaler; cardinal border
at right with two auriculae, the posterior the longer. Foot with
a very stout byssus. Gills fused to the mantle. Atacida;
British. Melosplina. Pearls are obtained from a species of this
genus in the Persian Gulf, Indian Ocean, &c. Melanis. Several
extinct genera.

Fam. 3. Prasinidae.—Shell inequivaler, with anterior umbones
and prominent anterior auricula; cardinal border arched.

Fam. 4. Placidae.—Extinct; Palaeeconcha.

Fam. 5. Lamellicardidae.—Extinct; Silurian and Devonian.

Fam. 6. Conocardiidae.—Extinct; Silurian to Carboniferous.

Fam. 7. Ambonychiidae.—Extinct; Silurian and Devonian. The
few families are dinyarian, with small anterior adductor.

Fam. 8. Myolinidae.—Extinct; Silurian to Cretaceous; add-
ductors sub-equal.

Fam. 9. Amissidae.—Shell orbicular, smooth externally with
radiating costae internally. Gills without interlamellae junc-
tions. Amusium.

Fam. 10. Spondylidae.—Shell very inequivaler, fixed by the right
valve which is the larger. No byssus. Spondylus; shell with
numerous ribs adhering to the byssuses.

Fam. 11. Pectinidae.—Shell with radiating ribs; dorsal border
with two auriculae. Foot byssiferous. Mantle borders with
well developed valves. Pecten; shell orbicular, with equal
auriculae; wide spread in the British. Chlamys; an-
terior auricula the larger and with a byssal sinus; British.
Pedum. Hinnites. Pseudammusium. Campionectes. Hyalo-
pecten; abyssal.

Sub-order V.—Dimyacea.

Dimyarian, with orbicular and almost equilateral shell; adherent;
hinge without teeth and ligament internal. Gills with free non-
attached filaments.

Fam. Dimyidae.—Characters of the sub-order. Dimy; recent
in abyssal depths and fossil since the Jurassic.

Order III. EULAMILLIBRANCHIA

Edges of the mantle generally united by one or two sutures.
Two adductors usually present. Branchial filaments united
by vascular interfilamentary junctions and vascular intermellar
junctions; the latter contain the afferent vessels. The gonads
always have their own proper external apertures.

Sub-order I.—Ostraecae.

Monomyarian or with a very small anterior adductor. Mantle
open; foot rather small; branchiæ folded; shell inequivaler.

Fam. 1. Limidae.—Shell formed with articulation auricula.
Foot digiform, with byssus. Borders of mantle with long and numerous tentacles.

Gills not united with mantle. Lima; members of this genus
form a nest by means of the byssus, or swim by clapping
the valves of the shell together. Limidae.

Fam. 2. Ostraecidae.—Foot much reduced and without byssus.
Heart usually on the ventral side of the rectum. Gills fused to
the mantle. Shell irregular, fixed in the young by the left and
large valve. Ostra; foot absent in the adult; edible and
cultivated; some species, as the British O. adulter, are herring-
shaped.

Fam. 3. Eligmacidae.—Extinct; Jurassic.

Fam. 4. Pinidae.—Shell elongated, truncated and gaping
posteriorly. Dimyarian, with a very small anterior adductor.

Foot with byssus. Pinna; British. Cyrtodonta. Avicul-
opingia; fossil, Carboniferous and Permian. Pinnaeina; Jurassic and
Cretaceous. Arrina; fossil and recent, from Carboniferous to
present day.

Sub-order II.—Subostracae.

Mantle only slightly closed; usually there is only a single suture.
Siphons absent or very short. Gills smooth. Nearly always di-
myarian. Shell equivale, with an external ligament.

Fam. 1. Dreissensidae.—Shell elongated; hinge without teeth;
sides of valves with an internal septum. Siphons short.
Dreissensia; lives in fresh water, but originated from the
Caspian Sea; introduced into England about 1824.

Fam. 2. Modiolaridae.—Foot with a plantar surface; the two
branchial plates serve as incubatory pouches. Modiotara.

Fam. 3. Artiidae.—Shell concentrically striated; foot elongate,
without byssus. Arti; British. Woodia. Opis; Secondary.

Prosopoconia; Devonian.
Fam. 4. Crassatellidae.—Shell thick, with concentric striae, ligament external; foot short. Crassatella. Cuna.

Fam. 5. Carditidae.—Shell thick, with radiating costae; foot carinated, often byssifixed. Cardita. Thecalia. Mitneria.

Fam. 8. Isocardidae.—Mantle largely closed, pedal orifice small; gill-plates of equal size; shell globular, with prominent and coiled umbones. Isocardia. British.

Fam. 9. Callocardidae.—Siphons present; external gill-plates smaller than the internal; umbones not prominent. Callocardia. abyssal.

Fam. 11. Corbicidae.—Shell thick, with denticulated borders; anal aperture with valve but no siphon; elongated and pointed. Corbis. Gonodon. Trias and Jurassic. Mutella. Upper Cretaceous.

Fam. 21. Pseudocardinae.—Two short siphons; shell with prominent umbones and internal ligament. Rangia. brachiate shell. Florida.

Sub-order III.—Tellinacea.

Mantle not extensively closed; two pallial sutures and two well-developed siphons. Gill's smooth. Foot compressed and elongated. Labial palps very large. Diminarian; pallial line with a deep sinus.

Fam. 3. Donacidae.—External gill-plate directed ventrally; siphons separate, of moderate length, anal siphon the longer. Donax. British. Phikania.

Sub-order IV.—Veneracea.

Two pallial sutures, siphons somewhat elongated and partially or wholly united. Gill's slightly folded. A bulb on the posterior aorta. Ligament external.

Fam. 2. Petricoliidae.—Boring forms with a reduced foot; shell elongated, with deep pallial sinus. Petricola. P. philadelphia, originally an inhabitant of the coast of the United States, has been acclimatized for some years in the North Sea.

Fam. 3. Glaucomyidae.—Siphons very long and united; foot small; shell thick with deep pallial sinus; fresh or brackish water. Glaucoma. Tanyysiphon.

Sub-order V.—Cardiacea.

Two pallial sutures. Siphons generally short. Foot cylindrical, more o less elongated, byssogenous. Gill's much folded. Shell equivale, with radiating costae and external ligament.

Fam. 1. Cardiidae.—Mantle slightly closed; siphons very short, supplied by papillae which often bear eyes; foot very long, geniculated; pallial line without sutus; two adductors; Cardium. British. Pseudo-kellya. Byssocardium. Eocene. Lithocardium. Eocene.

Fam. 2. Limnocardiidae.—Siphons very long, united throughout; shell gaping; two adductors; brackish waters. Limnocardia. Caspian Sea and fossil from the Tertiary. Archicardia. Tertiary.

Fam. 3. Tridacnidae.—Mantle closed to a considerable extent; apertures distant from each other; no siphons; a single adductor; shell thick. Tridaca. Hippopus.

Sub-order VI.—Chamacea.

Asymmetrical, inequivalve, fixed, with extensive pallial sutures; no siphons. Two adductors. Foot reduced and without byssus. Shell without pallial sinus.

Fam. 2. Caprinidae.—Shell inequivalve; fixed valve spiral or conical; free valve coiled or spiral; Cretaceous. Caprina. Caprinula. Caprinula, &c.

Fam. 3. Monopleuridae.—Shell very inequivalve; fixed valve conical or spiral; free valve operculiform; Cretaceous. Monopleura. Bayolea. The two following families, together known as Rudistae, are closely allied to the preceding; they are extinct marine forms from Secondary deposits. They were fixed by the...
conical elongated right valve; the free left valve is not spiral, and is furnished with prominent apophyses to which the adductors were attached.

Fam. 4. Radiolidae.—Shell conical or biconvex, without canals or byssal marks.

Fam. 5. Hippuritidae.—Fixed valve long, cylindro-conical, with three longitudinal furrows which correspond internally to two pillars for support of the siphons. Hippurites. Arnaudia.

Sub-order VII. —Myacea. Mantle closed to a considerable extent; siphons well developed; gills much folded and frequently prolonged into the branchial gill. Foot compressed and generally byssiferous. Shell gaping, with a pallial sinus.

Fam. 2. Myidae.—Siphons united for the greater part of their length, and with a cincture of tentacles near their extremities; foot reduced; shell gaping; ligament internal. Mya; British. Spiralia. British. Tugonia. Platydony. Cryptomya.

Fam. 3. Corbulidae.—Shell sub-trigonal, inequivalve; pallial sinus shallow; siphons short, united, completely retractile; foot large, pointed, often byssiferous. Corbulomia. Paramya. Erodena and Himelina are fluvial forms from South America.

Fam. 4. Lutrariidae.—Mantle extensively closed; a fourth pallial aperture; siphons long and united; shell elongated, a spoon-shaped projection for the ligament on each valve. Lutraria; British. Tresus. Stanella.

Fam. 5. Solenidae.—Elongated burrowing forms; foot cylindrical, posterior cavity is filled by shell long, trunated and gaping at each end. Solenocurtus; British. Tagelus; estuarine. Ceratoldera; British. Cellellus; British. Siltagia. Solen; British. Entostraca.

Fam. 6. Saxicinae.—Mantle extensively closed, with a small pedal orifice; siphons long, united, covered by a chitinous sheath; gills prolonged into the branchial siphon; foot small; shell gaping. Saxicinae; British. Glycimerida. Cystoderida.

Fam. 7. Veneridae.—Shell gaping widely at the posterior end; anterior adductor much reduced; mantle extensively closed; siphons long, united. Gastrochaena; British. Fistsulata.

Sub-order VIII. —Adesmacea. Ligament wanting; shell gaping, with a styloid apophysis in the umbonal cavities. Gills prolonged into the branchial siphon. Mantle largely closed, siphons long, united. Foot short, truncated, discoid, without byssus.

Fam. 1. Pholadidae.—Shell containing all organs; heart traversed by the rectum; two aortae. Shell with a pallial sinus; dorsal region protected by accessory plates. Pholadidae; British. Pholadidae; British. Jowannetta. Xylophaga; British. Mariestia.

Fam. 2. Tanidae.—Shell globular, covering only a small portion of the vermiciform body; heart on ventral side of rectum; a single aorta; siphons long, united and furnished with two posterior calcaceous "pallets." Terebida; British. Xylophaga.

Sub-order IX. —Anatomea. Hermaphrodite, the ovaries and testes distinct, with separate apertures. Foot rather small. Mantle frequently presents a fourth orifice. External gill-plate directed dorsally and without reflected lamella. Hinge without teeth.

Fam. 1. Thracidae.—Mantle with a fourth aperture; siphons long, quite separate, completely retractile and invertebrate. Thracia; British. Asinohaera.

Fam. 2. Periploidae.—Siphons separate, naked, completely retractile but not inequivalve. Periploidae. Cochlidota; British. Tylida; British. Anatomea.

Fam. 3. Anatidae.—Siphons long, united, covered by a chitinous sheath, not completely retractile. Anatida; British. Plectomya; British. Jurassic and Cretaceous.

Fam. 4. Pholadidae. —Mantle with fourth aperture; siphons very long, completely united, naked, incompletely retractile; foot small, with posterior appendage. Pholadidae. Pholadomya.

Fam. 5. Arcomyidae.—Extinct; Secondary and Tertiary. Arcomyidae. Mytilomya.

Fam. 8. Pandoridae.—Shell thin, inequivalve, free, ligament internal; siphons very short. Pandora; British. Coelodon. Glistophora.

Fam. 9. Pholadomycidae.—Shell very inequivalve, solid, with a pallial sinus; siphons short; foot small. Myochama. Myodora.

Fam. 10. Chamaesidae.—A fourth pallial aperture present; pedal aperture small; siphons very short and separate; shell fixed by the right valve, irregular. Chamaesia.

Order IV. Septibranchia.

Gills have lost their respiratory function, and are transformed into a muscular septum on each side between mantle and foot. All marine, live at considerable depths, and are carnivorous.

Fam. 1. Poromyidae.—Siphons short and separate; branchial siphon with a large valve; branchial septum bears two groups of orifices on either side; hermaphrodite. Poromya; British. Dermatoyma. Liopistha; Cretaceous.

Fam. 2. Cetocnidae.—Branchial septum with three groups of orifices on each side; siphons short, separate, branchial siphon with a valve. Cetocnida (Silenea).

Fam. 3. Cupidaridae.—Branchial septum with four or five pairs of very narrow symmetrical orifices; siphons long, united, their extremities surrounded by tentacles; sexes separate. Cupidaria; British.

LAMENNAIS, HUGUES FÉLIGIĆ Robert DE (1782-1854). French priest, and philosophical and political writer, was born at Saint Malo, in Brittany, on the 19th of June 1812. He was the son of a shipowner of Saint Malo ennobled by Louis XVI. He spent his youth on the merchant service, and was intended by his father to follow mercantile pursuits. He spent long hours in the library of an uncle, devouring the writings of Rousseau, Pascal and others. He thereby acquired a vast and varied, though superficial, erudition, which determined his subsequent career. Of a sickly and sensitive nature, and impressed by the horrors of the French Revolution, his mind was early seized with a morbid view of life, and this temper characterized him throughout all his changes of opinion and circumstance. He was at first inclined towards rationalistic views, but partly through the influence of his brother Jean Marie (1775-1861), partly as a result of his philosophical and historical studies, he felt belief to be indispensable to action and saw in religion the most powerful leaven of the community. He gave utterance to these convictions in the Réflexions sur l'état de l'église en France pendant le 18ème siècle et sur sa situation actuelle, published anonymously in Paris in 1808. Napoleon's police seized the book as dangerously ideological, with its eager recommendation of religious revival and active clerical organization, but it awoke the ultramontane spirit which has since played so great a part in the politics of churches and of states.

As a rest from political strife, Lamennais devoted most of the following year to a translation, in exquisite French, of the Speculum Monarchorum of Ludovici Blosius (Louis de Blos) which he entitled Le Guide spirituel (1809). In 1811 he received the tonture and shortly afterwards became professor of mathematics in an ecclesiastical college founded by his brother at Saint Malo. Soon after Napoleon had concluded the Concordat with Pius VII. he published, in conjunction with his brother, De la tradition de l'église sur l'institution des évêques (1814), a writing occasioned by the emperor's nomination of Cardinal Maury to the archbishopric of Paris, in which he strongly condemned the Gallican principle which allowed bishops to be created irrespective of the pope. He was in Paris in 1815 at the Bourbon restoration, in 1814, which he hailed with satisfaction, less as a monarchist than as a strenuous apostle of religious regeneration. Dreading the Cent Jours, he escaped to London, where he obtained a meagre livelihood by giving French lessons in a school founded by the abbé Jules Carron for French émigrés;
he also became tutor at the house of Lady Jerningham, whose first impression of him as an imbecile changed into friendship. On the fall of Napoleon in 1813 he returned to Paris, and in the following year, with many misgivings as to his calling, he yielded to his brother's and Carron's advice, and was ordained priest by the bishop of Rennes.

The first volume of his great work, *Essai sur l'indifférence en matière de religion*, appeared in 1817 (Eng. trans. by Lord Stanley of Alderley, London, 1868), and affected Europe like a spell, investing, in the words of Lacordaire, a humble priest with all the authority once enjoyed by Bossuet. Lamennais denounced toleration, and advocated a Catholic restoration to belief. The right of private judgment, introduced by Descartes and Leibnitz into philosophy and science, by Luther into religion and by Rousseau and the Encyclopaedists into politics and society, had, he contended, terminated in practical atheism and spiritual death. Ecclesiastical authority, founded on the absolute revelation delivered to the Jewish people, but supported by the universal tradition of all nations, he proclaimed to be the sole hope of regenerating the European communities. Three more volumes (Paris, 1818-1824) followed, and met with the strongest reception from the Gallican bishops and monarchists, but with the enthusiastic adhesion of the younger clergy. The work was examined by three Roman theologians, and received the formal approval of Leo XII. Lamennais visited Rome at the pope's request, and was offered a place in the Sacred College, which he refused. On his return to France he took a prominent part in political work, and together with Chateaubriand, the vicomte de Villedé, was a regular contributor to the *Conservateur*, but when Villedé became the chief of the supporters of absolute monarchy, Lamennais withdrew his support and started two rival organs, *Le Drapeau blanc* and *Le Mémorial catholique*. Various other minor works, together with *De la religion considérée dans ses rapports avec l'ordre civil et politique* (2 vols., 1825-1826), kept his name before the public.

He retired to La Chénaie and gathered round him a host of brilliant disciples, including C. de Montalembert, Lacordaire and Maurice de Guérin, his object being to form an organized body of opinion to persuade the French clergy and laity to throw off the yoke of the state connexion. With Rome at his back, as he thought, he adopted a frank and bold attitude in denouncing the liberties of the Gallican church. His health broke down and he went to the Pyrenees to recruit. On his return to La Chénaie in 1827 he had another dangerous illness, which powerfully impressed him with the thought that he had only been dragged back to life to be the instrument of Providence. *Les Progrès de la révolution et de la guerre contre l'église* (1828) marked Lamennais's complete renunciation of royalist principles, and henceforward he dreamt of the advent of a theocratic democracy. To give effect to these views he founded *L'Avenir*, the first number of which appeared on the 16th of October 1830, with the motto "God and Liberty." From the first the paper was aggressively democratic; it demanded rights of local administration, an enlarged suffrage, universal freedom of conscience, freedom of instruction, of meeting, and of the press. Methods of worship were to be criticized, improved or abolished in absolute subjection to the spiritual, not to the temporal authority. With the help of Montalembert, he founded the *Agence générale pour la défense de la liberté religieuse*, which became a far-reaching organization, it had agents all over the land who noted any violations of religious freedom and reported them to headquarters. As a result, *L'Avenir* was stormy, and the opposition of the Conservative bishops checked its circulation; Lamennais, Montalembert and Lacordaire resolved to suspend it for a while, and they set out to Rome in November 1831 to obtain the approval of Gregory XVI. The "pilgrims of liberty" were, after much opposition, received in audience by the pope, but only on the condition that the object which brought them to Rome should not be mentioned. This was a bitter disappointment to such earnest ultramontanes, who received, a few days after the audience, a letter from Cardinal Pacca, advising their departure from Rome and suggesting that the Holy See, whilst admitting the justice of their intentions, would like the matter left open for the present. Lacordaire and Montalembert obeyed; Lamennais, however, remained in Rome, but his last hope vanished with the issue of Gregory's letter to the Polish bishops, in which the Polish patriots were reproved and the tsar was affirmed to be their lawful sovereign. He then "shook the dust of Rome from off his feet." At Munich in 1832, he received the encyclical *Mirari vos*, condemning his policy; as a result *L'Avenir* ceased and the *Agence* was dissolved.

Lamennais, with his two lieutenants, submitted, and deeply wounded, retired to La Chénaie. His genius and prophetic insight had turned the entire Catholic church against him, and those for whom he had fought so long were the fiercest of his opponents. The famous *Paroles d'un croyant*, published in 1834 through the intermediary of Sainte-Beuve, marks Lamennais's secession from the church. "A book, small in size, but immense in its perversity," was Gregory's criticism in a new encyclical letter. A tractate of aphorisms, it has the vigour of a Hebrew prophecy and contains the choicest gems of poetical feeling lost in a whirlwind of exaggerations and distorted views of kings and statesmen. This work had an extraordinary circulation and was translated into many European languages. It is now forgotten as a whole, but the beautiful appeals to love and human brotherhood are still reprinted in every hand-book of French literature.

Henceforth Lamennais was the apostle of the people alone, *Les Affaires de Rome, des maux de l'église et de la société* (1837) came from old habit of religious discussions rather than from his real mind of 1837, or at most it was but a last word. *Le Livre du peuple* (1837), *De l'esclavage moderne* (1839), *Politique à l'usage du peuple* (1839), three volumes of articles from the journal of the extreme democracy, *Le Monde*, are titles of works which show that he had arrived among the missionaries of liberty, equality and fraternity, and he soon got a share of their martyrdom. *Le Pays et le gouvernement* (1840) caused him a year's imprisonment. He struggled through difficulties of lost friendships, limited means and personal illnesses, faithful to the last to his hardly won dogma of the sovereignty of the people, and, to judge by his contribution to Louis Blanc's *Revue du Peuple*, he was ready for something like communism. He was named president of the "Société de la solidarité républicaine," which counted half a million adherents in fifteen days. The Revolution of 1848 had his sympathies, and he started *Le Peuple constituant*; however, he was compelled to stop it on the 10th of July, complaining that silence was for the poor, but again he was at the head of *La Révolution démocratique et sociale*, which also succumbed. In the constituent assembly he sat on the left till the coup d'état of Napoleon III. in 1851 put an end to all hopes of popular freedom. While deputy he drew up a constitution, but it was rejected as too radical. Thereafter a translation of Dante chiefly occupied him till his death, which took place in Paris on the 27th of February 1854. He refused to be reconciled to the church, and was buried according to his own directions at Père La Chaise without funeral rites, being mourned by a countless concourse of democratic and literary admirers.

During the most difficult time of his republican period he found solace for his intellect in the composition of *Une voix de prison*, written during his imprisonment in a similar strain to *Les paroles d'un croyant*. This is an interesting contribution to the literature of captivity; it was published in Paris in 1846. He also wrote *Esquisse de philosophie* (1846). Of the four volumes of this work the third, which is an exposition of art as a development from the aspirations and necessities of the temple, stands pre-eminent, and remains the best evidence of his thinking power and brilliant style.

There are two so-called *Oeuvres complètes* of Lamennais, the first in 10 volumes (Paris, 1836-1837), and the other in 10 volumes (Paris, 1844); both these are very incomplete and only contain the works mentioned above. The most noteworthy of his writings subsequent are: *Amussements et Discours* (1843), *Le Délit de la Pologne* (1846), *Mélanges philosophiques et politiques* (1856), *Les Événements* (1846) and *La Divine Comédie*, these latter being translations of the Gospels and of Dante.
Part of his voluminous correspondence has also appeared. The most interesting volumes are the following: Correspondance de F. de Lamennais, edited by E. D. Forges (2 vols., 1855-1858); Études inédites de F. Lamennais, edited by Ange Blaise (2 vols., 1860); Correspondance inédite entre Lamennais et le baron de Vitrolles, edited by E. D. Forges (1819-1853); Conférences de Lamennais, lettre inédites de 1821 à 1845, edited by A. du Bois de la Villérabel (1886); Lamennais après des documents inédits, by Alfred Roussel (Rennes, 2 vols., 1852-1853); Lamennais et ses correspondants, edited by A. Roussel (Rennes, 1887); Un Lamennais inconnu, edited by A. Lavelle (1889); Lettres de Lamennais à Montalembert, edited by E. D. Forges (1889); and other books listed in the Répertoire, Revue britannique, &c.

A list of lives or studies on Lamennais would fill several columns. The following may be mentioned. A Blaise, Essai biographique sur M. de Lamennais (1858); E. D. Forges, Notes et souvenirs (1859); F. Brunetière, Nouvelles correspon-sante inédites (1891); E. Faget, Politiques et moralistes, ii. (1898); P. Janet, La Philosophie de Lamennais (1890); P. Mercier, S.J., Lamennais d’après sa correspondance et les travaux les plus récents (1893); A. Mollien and F. Duuze, Lamennais, sa vie et ses idées; Pages choisies (Lyons, 1898); The Hon. W. Gibson, The Abbé de Lamennais and the Liberal Catholic Movement in France (London, 1896); E. Renan Essais de morale et de critique (1857); E. Schérer, Milanges de critique religieuse (1859); G. E. **Lamentations** (Lamentations of Jeremiah), a book of the Old Testament. In Hebrew MSS. and editions this little collection of liturgical poems is entitled "Poimëni," the first word of the poet's name (cf. the books of the Pentateuch, and the Babylonian Epic of Creation (a far older work). In the Septuagint it is called "θεάμα," "Funeral-songs" or "Dirges," the usual rendering of Heb. נֵבֶל (Am. v. 1; Jer. vii. 20; 2 Sam. i. 17), which is, in fact, the name in the Talmud (Baba Batha 150a) and other Jewish writings; and it was known as such to the Fathers (Jerome, Cineth). The Septuagint (B) introduces the book thus: "And it came to pass, after Israel was taken captive and Jerusalem laid waste, Jeremiah sat weeping, and lamented with this lamentation over Jerusalem, and said . . .," a notice which may have related originally to the first poem only. Some Septuagint MSS. and the Syriac and other versions, have the fuller title Lamentations of Jeremiah.

In the Hebrew Bible Lamentations is placed among the Céditions or Hagiographa, usually as the middle book of the five Megiloth or Pernal Rolls (Canticles, Ruth, Lamentations, Ecclesiastes, Esther) accordance on some days on which they are read in the Synagogue, Lamentations being read on the 9th of Ab (6th of August), when the destruction of the Temple is commemorated (Mass. Sophérim 18). But the Septuagint appe ads the book to Jeremiah (Baruch interpreting), just as it adds Ruth to Judges; thus making the number of the books of the Hebrew Canon the same as that of the letters of the Hebrew alphabet, viz. twenty-two (see Baba Batha 145).

**External features and poetical structure.**—These poems exhibit a peculiar metre, the so-called "limping verse," of which Am. v. 2 is a good instance: "She is fallen, to rise no more—
Left torn upon her land—
None raising her!"

A longer line, with three accented syllables, is followed by a shorter with two. Chs. i.-iii. consist of stanzas of three such couplets each; chs. iv. and v. of two like Am. v. 2. This metre came in to time be distinctive of elegy. The text of Lamentations, however, so often deviates from it, that we can only affirm the tendency of the poet to cast his couplets into this type (Driver). Some anomalies, both of metre and of sense, may be removed by judicious emendation; and many lines become smooth enough, if we assume a crisis of open vowels of the same class, or a diphthong pronunciation of others, or contraction or silence of certain suffixes as in Syrian. The oldest editions of Lamentations are not couched in this metre; e.g. David's (2 Sam. iii. 33 f. Abner; ib. i. 29-27 Saul and Jonathan). Yet the refrain of the latter, 'Elīk nāfša lāh giborōn, "Ah how are heroes fallen!" agrees with our longer line. The remote ancestor of this Hebrew metre may be recognized in the Babylonian epic of Gilgamesh, written at least a thousand years earlier:—

_Ezō-bēni ūri izōnēni | Nimru shē qēri_

"Ebanai, my friend, my little brother! | Leopold of the Wild!
and again:—

_Kifī ḫūṣūṭ | Kifī Ṿigūlī-ma_

_ūrō šah ardōma | ëmō tiṣīṭiš_

"How shall I be dumb? | How shall I bewail?"

The friend whom I love | Is turned to clay!"

Like a few of the Psalms, Lamentations i.-iv. are alphabetical acrostics. Each poem contains twenty-two stanzas, corresponding to the twenty-two letters of the Hebrew alphabet; and each stanza begins with its proper letter. (In ch. iii. each of the three couplets in a stanza begins with the same letter, so that the alphabet is repeated thrice: cf. Psalm cxix. for an eight-fold repetition.) The alphabet of Lamentations ii. iii. iv. varies from the usual order of the letters by placing Pe before Ain. The same was doubtless the case in ch. i. also until some scribe altered it. He went no further, because the sense forbade it in many other instances. The variation may have been local, either in Judea or in Babylonia; or the author may have had some fanciful reason for the transposition, such as, for example, that Pe following Sowm (אכ) might suggest the word רמא, "Well yel!" (2 Sam. iii. 37). Although the elders: Hebrew elegies are not alphabetical acrostics, it is a curious fact that these authors, when writing "Poimēn," repeated (Seew. i. 17; iv. vii. 4), is formed by the initial letters of the four lines on Abner (om. 3, line 3); and the initials of the verses of David's great elegy are Ṿāsan 20, which may be read as a sentence meaning, perhaps, "Lo, I the Avenger" (cf. Deut. xxxii. 41, 43) "will go forth!" or the first two letters (כט) may stand for כחונ, "Alas, my brother!" (Jer. xxii. 18; cf. xxxiv. 5). In cryptic fashion the poet thus registers a vow of vengeance on the Philistines. Both kinds of acrostic occur side by side in the Psalms. Psalm cx., an acrostic of the same kind as David's elegy, is followed by Psalms cxxi. cxxii., which are alphabetical acrostics, like the Lamentations. Such artifices are not in themselves greater clogs on poetic expression than the excessive alliteration of old Saxon verse or the strict rhythms of modern lyrics. (Alliteration, both initial and internal, is common in Lamentations.)

As the final piece, ch. v. may have suffered more in transmission than any which precede it—even to the extent of losing the acrostic form (like some of the Psalms and Nahum 1), besides half of its stanzas. If we divide the chapter into quatrains, like ch. iv., we notice several vestiges of an acrostic. The Alph stanza (verses 7, 8) still precedes the Beth (verses 9, 10), and the Ain is still quite clear (verses 17, 18; cf. i. 16). Transposing verses 5, 6, and correcting their text, we see that the Jod stanza (verses 3, 4) precedes the Lamed (verses 6, 5), Caph having disappeared between them. With this clue, we may rearrange the other quatrains in alphabetical sequence, each according to its initial letter. We thus get a broken series of eleven stanzas, beginning with the letters א (verses 7, 8), ב (9, 10), ג (11, 22), ו (19, cf. Psalm cii. 13; and 20), י (1, 2), ת (13, 14), י (3, 4), ו (6, 5), ינופו (59), י (11, 12), י (17, 18), and י (15, 16), successively.

An internal connexion will now be apparent in all the stanzas.

**General subject and outline of contents.**—The theme of Lamentations is the final siege and fall of Jerusalem (586 B.C.), and the attendant and subsequent miseries of the Jewish people.

In ch. i. we have a vivid picture of the distress of Zion, after all is over. The poet does not describe the events of the siege, nor the horrors of the capture, but the painful experience of subjection and tyranny which followed. Neither this nor ch. ii. is strictly a "dirge." Zion is not dead. She is personified as a widowed princess, bereaved and desolate, sitting amid the ruins of her former joys, and brooding over her calamities. From verse 112 to the end (except verse 17) she herself is the speaker:—

_O come, ye travellers all!
Beyold and see
If grief there be like mine!_
LAMENTATIONS

She images her sorrows under a variety of metaphors (cf. ch. iii. 1-18); ascribing all her woes to Yahweh's righteous wrath, provoked by her sins, and crying for vengeance on the malicious rival who had rejoiced at her overthrow. 

The text has suffered much. Verse 5c reads: תֵּשָׁה (v. 18), "into captivity," דְּמָה (v. 7), "adversaries." For verse 7, see Budde, V. 14, read יִתְעַבֵּר; verse 15c reads: יִתְעַבֵּר הָאָדֶם. For they sought food to restore life, and found it not: "(Septuagint) in distress." Verse 20: the incongruous "captive." For I grievously rebel, should be עַבֵּר מִי הָאָדֶם, "My inward burn:"

Chapter ii.—"Ah how in wrath the Lord | Beclouts Bath-Sion!" The poet laments Yahweh's anger as the true cause which destroyed city and kingdom, suspended feasts and Sabbath, rejected altar and sanctuary. He mentions the uproot of the victors in the Temple; the dismantling of the walls; the exile of king and princes (verses 1-9). He recalls the mourning in the doomed city; the children dying of hunger in the streets; the prophets deluding the people with vain hopes. Passers-by jeered at the fallen city; and all her enemies triumphed over her (verses 10-17). Zion is urged to cry to the Lord in protest against His pitiless work (verses 18-22).

Here too emendation is necessary. Verse 4b: יִתְעַבֵּר, "He fixed His arrow, sc. on the string (Septuagint, ἐστηκόμην);" cf. Ezek. viii. 2, 5. Add at the end יִתְעַבֵּר. He spent His anger: see iv. 11: Ezek. vii. 8, xx. 8, 21. Verse 6: יִתְעַבֵּר יִתְעַבֵּר וַיַּעֲבִר לָהֶם. "And He broke down the wall of His dwelling-place (Septuagint τὸ κτίσμα αὐτοῦ; cf. Psalm lxxix. 76, where for "keeping down" read "of Him")—among the nations without Torah" (cf. Ezek. vii. 26 f.). Verse 18: "Cry much" (יִחְמְשֵׁב; or bitterly, יִפְלָה, Zeph. i. 14) "unto the Lord, O Virgin Daughter of Zion!" Verse 19 is metrically redundant, and the last clauses do not agree with what follows. "For the life of the little children was altered from (for what He hath done to thee) (יִתְעַבֵּר וַיִּתְעַבֵּר לָהֶם; and then the rest was added. The uniform gloom of this, the most dire-like of all the pieces, is unredeemed by a single ray of hope, even the hope of vengeance; cf. chap. iii. 1-14.

Chapter iii.—Here the nation is personified as a man (cf. Hosea i. 1), who laments his own calamities. In view of i. 12-22, li. 20-22, this is hardly a serious deviation from the strict form of elegy (Klagelied). Budde makes much of the close external connexion with ch. ii. The truth is that the break is as great as between any two of these poems. Chapter ii. ends with a mother's lament over her slaughtered children; chapter iii. makes an entirely new beginning, with its abruptly independent "I am the Man!" The suppression of the Divine Name is intentional. Israel durst not breathe it, until compelled by the climax, verse 18: cf. Am. vi. 10. Contrast its frequency afterwards, when ground of hope is found in the Divine pity and purpose (verses 22-40), and when the contrite nation turns to its God in prayer (verses 55-66). The spiritual aspect of things is now the main topic. The poet deals less with incident, and more with the moral significance of the nation's sufferings. It is the religious culmination of the book. His poem is rather lyrical than narrative, which may account for some obscurities in the connexion of thought; but his alphabetic scheme proves him to be deeply thinking, and not two-thirds daekh-couplings. There is something arresting in that bold "I am the Man!" and the lyrical intensity, the religious depth and beauty of the whole, may well blind us to occasional ruggedness of metre and language, abrupt transitions from figure to figure and other alleged blemishes, some of which may not have seemed such to the poet's contemporaries (e.g. the repetition of the acrostic word, far more frequent in Psalm cxix.); and some disappear on revision of the text.

Verse 5, perhaps: "He swallowed me up," (Jer. iii. 44) "and begirt my head" (Septuagint) "with gloom" (יָסִיף Is. lviii. 10, cf. verse 6, yet cf. also יָסִיף, Neh. ix. 32). Verse 14: "all my people," rather all peoples (Heb. MSS. and Syr.), Verses 16b, rd. יִתְעַבֵּר, "He made me bore" (i.e. grovel) "in the ashes:" (cf. Jer. xiii. 14); "The yoke of our neck they made heavy" (Neh. v. 15; יָסִיף). We toil, and no rest do we find (Neh. xii. 5). Nor princes staggered under logs (יָסִיף for יָסִיף, which belongs to verse 14; יָסִיף for יָסִיף. Excl. v. 7: Is. xxxvi. 12; Neh. iv. 14;
LAMENTATIONS

Authorship and date.—The tradition of Jeremiah’s authorship cannot be traced higher than the Septuagint version. The preterit note there may come from a Hebrew MS, but perhaps refers to chapter i. only (“Jeremiah sang this dirge”). The idea that Lamentations was originally appended to Jeremiah in the Hebrew Bible, as it is in the old versions, and was afterwards separated from it and added to the other Megilloth for the liturgical convenience of the Synagogue, rests on the fact that Josephus (Ap. i. 1, 8) and, following him, Jerome and Origen reckon 22 books, taking Ruth with Judges and Lamentations with Jeremiah; whereas the ordinary Jewish reckoning gives 24 books, as in our Hebrew Bibles. There is no evidence that this artificial reckoning according to the number of letters in the Hebrew alphabet was ever much more than a fanciful suggestion. Even in the Septuagint the existing order may not be original. It appears likely that Lamentations was not translated by the same hand as Jeremiah (Nöldeke). Unlike the latter, the Septuagint Lamentations sticks closely to the Massoretic text. The two books can hardly have been united from the first. On the strength of 2 Chron. xxv. 25, some ancient writers (e.g. Jerome ad Zech. xii. 11) held that Jeremiah composed Lamentations. When, however, Josephus (Ant. x. 5, 1) states that Jeremiah wrote an elegy on Josiah still extant in his day, he may be merely quoting a little too much of Chron. loc. cit.; and it is obvious that he need not mean our book (see Whiston’s note). It is urged, indeed, that the author of Chronicles could not have imagined a prophet to have sympathized with such a king as Zedekiah so warmly as is implied by Lamentations iv. 20; and, therefore, he must have connected the passage with Josiah, the last of the kings. However that may have been, the Chronicler neither says that Jeremiah wrote all the elegies comprised in The Qinoh, nor does he imply that the entire collection consisted of only five pieces. Rather, the contrary; for he implies that The Qinoh contained not only Jeremiah’s single dirge on Josiah, but also the elegies of “all the singing men and singing women,” from the time of Josiah’s death (608) down to his own day (3rd century). The untimely fate of Josiah became a stock allusion in dirges. It is not meant that for three centuries the dirge-writers had nothing else to sing of; much less, that they sang of the fall of Jerusalem (presupposed by our book) before its occurrence. Upon the whole, it does not seem probable, either that the Chronicler mistook Lamentations iv. for Jeremiah’s dirge on Josiah, or that the book he calls The Qinoh was identical with our Qinoh. Later writers, both Jewish and Christian, have noticed and pointed out the most striking of certain obscure similarities between Jeremiah and Lamentations (see Driver, L.O.T. p. 433 f.), and the supposed reference in Lamentations iii. 53 ff. to Jeremiah xxxviii. 6 ff., as well as the fact that Jeremiah was the one well-known inspired writer who had lived through the siege of Jerusalem—they naturally enough ascribed this little book to the prophet. It is certainly true that the same emotional temperament, dissolving in tears at the spectacle of the country’s woes, and expressing itself to a great extent in the same or similar language, is noticeable in the author(s) of Lamentations i.-iv. and in Jeremiah. And both refer these woes to the same cause, viz. the sins of the nation, and particularly of its prophets and priests.

This, however, is not enough to prove identity of authorship; and the following considerations militate strongly against the tradition. (i) The language and style of Lamentations are in general very unlike those of Jeremiah (see the details in Nägelsbach and Löhr); whatever allowance may be made for conventional differences in the phraseology of elegiac poetry and prophetic prose, even of a more or less lyrical cast. (ii) Lamentations i.-iv. show a knowledge of Ezekiel (cf. Lamentations ii. 45; Ez. xx. 8, 21; Lam. ii. 14; Ez. xxii. 24; xiii. 10, 14; Lam. ii. 15; Ez. xxviiii. 3; xxviii. 12; Lam. iv. 20; Ez. xix. 4, 8) and of Is. xi.-lxvi. (Lam. i. 10, xxiv; Is. lxiv. 10; Lam. i. 15; Is. lxvii. 2; Lam. ii. 1; Is. lxvi. 1; Lam. ii. 26; Is. xlii. 28; Lam. ii. 13 the 3 verbs; Is. xl. 18, 25; Lam. ii. 15; Is. lx. 17; Lam. iii. 26 sqq.; Is. lvii. 5; Lam. iii. 30; Is. i. 6; Lam. iv. 14; Is. lxi. 3, 10; Lam. iv. 15; Is. lii. 11; Lam. iv. 175; Is. lxiv. 20; Lam. lv. 22; Is. xi. 2). Jeremiah does not quote Ezekiel; and he could hardly have quoted writings of the age of Cyrus. (iii) The coincidences of language between Lamentations and certain late Psalms, such as Psalms lxix., lxxiv., lxxx., lxviii., lxxxix., cxix., are numerous and significant, at least as a general indication of date. (iv) The point of view of Lamentations sometimes differs from that of the prophet. This need not be the case in i. 21 f. where the context shows that the “enemies” are not the Chaldeans, but Judah’s ill neighbours, Edom, Ammon, Moab and the rest (cf. iv. 21 f.; iii. 59-66 may refer to the same foes). Ch. ii. 9c may refer to popular prophecy (“her prophets”; cf. verse 14), which would naturally be silenced by the overwhelming falsification of its comfortable predictions (iv. 14 ff.; cf. Jer. xiv. 15; Ezek. vii. 26 f.; Psalm lxiv. 9). But though Jeremiah was by no means dealoyal (Jer. xxxiv. 4 f.), he would hardly have spoken of Zedekiah in the terms of Lam. iv. 20; and the prophet never looked to Egypt for help, as the poet of iv. 17 appears to have done. It must be admitted that Lamentations exhibits, upon the whole, “a poet (more) in sympathy with the old life of the nation, whose attitude towards the temple and the king is far more popular than Jeremiah’s” (W. Robertson Smith); cf. i. 4, 10, 19, ii. 6, 7, 206. (v) While we find in Lamentations some things that we should not have expected from Jeremiah, we miss other things characteristic of the prophet. There is no trace of his confident faith in the restoration of both Israel and Judah (Jer. iii. 14-18, xxiii. 3-8, xxx.-xxxiii.), nor of his unique doctrine of the New Covenant (Jer. xxxii. 37-34), as a ground of hope and consolation for Zion. The only hope expressed in Lamentations i. is the hope of Divine vengeance on Judah’s malicious rivals (i. 21 f.); and even this is wanting from ch. ii. Chapter iii. finds comfort in the thought of Yahweh’s unfailling mercy; but ends with a louder cry for vengeance. Chapter iv. suggests neither hope nor consolation, until the end, where we have an assurance that Zion’s punishment is complete, and she will not again be exiled (iv. 21 f.). The last word is woe for Edom. In chapter v. we have a prayer for restoration: “Make us return, O Yahweh, and we shall return!” (i.e. to our pristine state). Had Jeremiah been the author, we should have expected something more positive and definitely prophetic in tone and spirit. (The author of chapter iii. seems to have felt this. It was apparently written in view of chapter ii. as a kind of religious counterpart to its burden of despair, which it first takes up, verses 4-20, and then dissipates, verses 21 f.). (vi) The Lamentations are almost superfluous: very brief and unpretentious (a brevity and unburdenedness of the prophet’s life after the fall of the city Jer. xxxix.-xliv.), it is difficult to specify an occasion when he may be supposed to have enjoyed the necessary leisure and quiet for the composition of these elaborate and carefully constructed pieces, in a style so remote from his ordinary freedom and spontaneity of utterance. And if at the very end of his stormy career he really found time and inclination to write anything of this nature, we may wonder why it was not included in the considerable and somewhat miscellaneous volume of his works, or at least mentioned in the chapters which relate to his public activity after the catastrophe.

Buddé’s date, 530 B.C., might not be too early for chapter v., if it stood alone. But it was evidently written as the close of the book, and perhaps to complete the Pentateuch; which would bring it below the date of Ezra (457 B.C.). And this date is supported by internal indications. The Divine forgetfulness has already lasted a very long time since the catastrophe (“for ever,” verse 20) which seems to imply the lapse of much more than thirty-six years (cf. Zech. i. 12). The hill of Zion is still a deserted site haunted by jackals, as it was when Nehemiah arrived, 445 B.C. (Neh. i. 3, ii. 13, 17, iv. 3). And the conditions, political and economic, seem to agree with what is told us by Nehemiah of the state of things which he found, and which prevailed before his coming: cf. esp. Neh. v. 24-5 with Lamentations
LAMETH—LAMETTRIE 129

V. 2, 10, and Neh. v. 15 with Lamentations v. 5, 8. There is nothing in chapter i. which Nehemiah himself might not have written, had he been a poet (cf. Neh. i. 4). The narrative of Neh. xiii. throws light on verse 10; and there are coincidences of language, e.g. "The Province" (of Judea), Neh. i. 3, cf. verse 1; "adversaries" (=w), of Judah's hostile neighbours, verse 7, Neh. iv. 11; "made my strength stumble," verse 14, cf.-Neh. iv. 4 (Heb.); the prayers, verses 21 f., Neh. iv. 4 f. (Heb. iii. 36 f.), are similar. The memory of what is told in Neh. iv. 5 (11), Ezra iv. 23 f., v. 5, may perhaps have suggested the peculiar term new, stoppage, arrest, verse 7. With verse 3 "Judah migrated from oppression; From great servitude of spirit; She settled among the nations, Without finding a resting-place," cf.-Neh. v. 18 end, Jer. xi. 11 f. The "remnant of the captivity" (Neh. iv. 1 f.) became much attuned (cf. verse 4), because all who could escape from the growing tyranny of the foreigner left the country (cf. verse 6). Verse 11, 19 (dread of food), 20 (danger in the field, starviation in the house) agree curiously with Neh. v. 6, 0 f.

Chapters ii. and iv. can hardly be dated earlier than the beginning of the Persian period. They might have then been written by one who, as a young man of sixteen or twenty, had witnessed the terrible scenes of fifty years before. If, however, as is generally recognized, these poems are not the spontaneous and unstudied outpourings of passionate grief, but compositions of calculated art and studied effects, written for a purpose, it is obvious that they need not be contemporary. A poem of a later generation might have sung of the great drama in this fashion. The chief incidents and episodes would be deeply graven in the popular memory; and it is the poet's function to make the past live again. There is much metaphor (i. 13-15, ii. 1-4, iii. 1-18, iv. 1-4), and little detail beyond the horrors usual in long sieges (see Deut. xxvii. 15 f. Kj), and Neh. vi. 28 f.). Acquaintance with the existing literature and the popular reminiscences of the last days of Jerusalem would supply an ample foundation for all that we find in these poems.

LITERATURE.—The older literature is fully given by Nagelschab in Lange's Bibelwerk A.T. xv. (1868, Eng. trans., 1871, p. 17). Among commentators may be noticed those of Kalkar (in Latin) (1836); O. Thenuen in Kurgefasset Exeg. Handbuch (1855), who ascribes chapters ii. and iv. to Jeremiah. K. Budde in Z.A.T.W., 1882, p. 45; Vattinger (1857); Neumann in H. M. H., in his Dict. vol. i. pt. ii. (2nd ed., 1866); Engelhardt (1876); Nagelschab, op. cit. (1868); E. Gerlach, Die Klagelied. Jer. (1868); A. Kamm in Die Lamentationen gereimt (1874), C. F. Keil (1872) (Eng. trans., 1874); Payne Smith in The Speaker Commentary, etc. {1875); L'arbre de vie; La Bible: poésie lyrique (1879); T. K. Cheyne, at the end of "Jeremiah," Pulpit Commentary (1883-1885); E. H. Plumptre, in Elliott's O.T. Bible (1888); J. de Vries, in Strack-Zöckner's Kurzgem. Komm. A.T. vii. (1879); M. Lörh (1881) and J. de Vries, in kommentar zum A.T. (1893); F. Baetgen ap. Kautzsch, Die heilige Schrift d. A.T. (1894); W. F. Adeney, Expositor's Bible (1895); S. Minoret, De la littérature des Lamentations (1883); K. Budde, "Fünf Megillot," in Karger IId.-Const. (1885).

LAMETH, ALEXANDRE THÉODORE VICTOR, COMTE DE (1760-1854), French soldier and politician, was born in Paris on the 25th of October 1760. He served in the American War of Independence under Rochambeau, and in 1789 was sent as deputy to the States General by the nobles of the bailiwick of Pérone. In the Constituent Assembly he formed with Barnave and Adrien Duport a sort of association called the "Triumvirate," which controlled a group of about forty deputies forming the advanced left of the Assembly. He presented a famous report in the Constituent Assembly on the organization of the army, but is better known by his eloquent speech on the 28th of February 1791, at the Jacobin Club, against Mirabeau, whose relations with the court were beginning to be suspected, and who was a personal enemy of Lameth. However, after the flight of the king to Varennes, Lameth became reconciled with the court. He served in the army as maréchal-de-camp under Luckner and Lafayette, but was accused of treason on the 15th of August 1792, fled the country, and was imprisoned by the Austrians. After his release he engaged in commerce at Hamburg with his brother Charles and the duc d'Aiguillon, and did not return to France until the Consulate. Under the Empire he was made prefect successively in several departments, and in 1810 was created a baron. In 1814 he attached himself to the Bourbons, and under the Restoration was appointed prefect of Somme, deputy for Seine-Inférieure and finally deputy for Seine-Inférieure, in which capacity he was a leader of the Liberal opposition. He died in Paris on the 18th of March 1829. He was the author of an important History of the Constituent Assembly (Paris, 2 vols., 1828-1829).

Of his two brothers, Theodore Lameth (1756-1854) served in the American war, sat in the Legislative Assembly as deputy from the department of Jura, and became maréchal-de-camp; and Charles Malo François Lameth (1757-1832), who also served in America, was deputy to the States General of 1789, but emigrated early in the Revolution and returned to France under the Consulate, and was appointed governor of Würzburg under the Empire. Like Alexander, Charles joined the Bourbons, succeeding Alexandre as deputy in 1829.

See F. A. Aulard, Les Oraire de l'Assemblée Constituante (Paris, 1905); also M. Tourneaux, Bibliography de l'histoire de Paris (vol. iv., 1826, p. "Lameth").

LAMETTRIE, JULIEN OFFRAY DE (1700-1755), French physician and philosopher, the earliest of the materialistic writers of the Illumination, was born at St Malo on the 25th of December 1709. After studying theology in the Jansenist schools for some years, he suddenly decided to adopt the profession of medicine. In 1733 he went to Leiden to study under Boerhaave, and in 1742 returned to Paris, where he obtained the appointment of surgeon to the guards. During an attack of fever he made observations on himself with reference to the action of quickened circulation upon thought, which led him to the conclusion that psychical phenomena were to be accounted for as the effects of organic changes in the brain and nervous system. This conclusion he worked out in his earliest philosophical work, the Histoire naturelle de l'âme, which appeared about 1745. So great was the outcry caused by its publication that Lamettrie was forced to take refuge in Leiden, where he developed his doctrines still more boldly and completely, and with great originality, in L'Homme machine (Eng. trans., London, 1750; ed. with introd. and notes, J. Assézel, 1865), and L'Homme planté, treatises based upon principles of the most consistently materialistic character. The ethics of these writings were later worked out in Discours sur le bonheur, La Volupté, and L'Art de jugeur which the natural life is found in the pleasures of the senses, and virtue is reduced to self-interest. Atheism is the only means of ensuring the happiness of the world, which has been rendered impossible by the wars brought about by theologians. The soul is only the thinking part of the body, and with the body it passes away. When death comes, the face is over (la force est foulee), therefore let us take our pleasure while we can. Lamettrie has been called "the Aristippus of modern materialism." So strong was the feeling against him
that in 1748 he was compelled to quit Holland for Berlin, where Frederick the Great not only allowed him to practise as a physician, but appointed him court reader. He died on the 11th of November 1751. His collected Œuvres philosophiques appeared after his death in several editions, published in London, Berlin and Amsterdam respectively.

The chief authority for his life is the Œloge written by Frederick the Great (printed in Anecdote of the Holy Alliance). In modern times Lamettrie has been judged less severely; see F. A. Lange, Geschichte der Materialismus (Eng. trans. by E. C. Thomas, ii. 1880); Nérée Quéquet (i. e. René Paquet), La Mettrie, sa vie et ses œuvres (1873, with complete history of his works); J. E. Poritzky, Die Lebens und Werke (1877); C. de Lamettrie, Sein Leben und seine Werke (1900); F. Picavet, "La Mettrie et la critique allemande," in Compte rendu des salons de l'Acad. des Sciences morales et politiques, xxxiii. (1889), a reply to German re- 

LAMIA, in Greek mythology, queen of Libya. She was beloved by Zeus, and when Hera robbed her of her children out of jealousy, she killed every child she could get into her power (Diod. Sic. xx. 41; Schol. Aristophanes, Ph. 737). Hence Lamia came to mean a female boar or demon, whose name was used by Greek mothers to frighten their children; from the Greek she passed into Roman demonology. She was represented with a woman's face and a serpent's tail. She was also known as a sort of fiend, the prototype of the modern vampire, who in the form of a beautiful woman enticed young men to her embraces, in order that she might feed on their heart and heart's blood. In this form she appears in Goethe's Die Braut von Corinth, and Keats's Lamia. The name Lamia is clearly the feminine form of Lamus, king of the Laestrygon (q.v.). At some early period, or in some districts, Lamus and Lamia (both, according to some accounts, children of Poseidon) were worshipped as gods; but the names did not attain general currency. Their history is remarkably like that of the malignant class of demons in Germanic and Celtic folk-lore. Both names occur in the geographical nomenclature of Greece and Asia Minor; and it is probable that the deities belong to that religion which spread from Asia Minor over Thrace into Greece.

LAMMAS (O. Eng. hlammase, hlafmaesse, from hlaf, loaf, and maesse, mass, "loaf-mass"), originally in England the festival of the wheat harvest celebrated on the 1st of August, O. S. It was one of the old quarter-days, being equivalent to midsummer, the others being Martinmas, equivalent to Michaelmas, Candlemas (Christmas) and Whitsun (Easter). Some rents are still payable in England at Lammas tide, and in Scotland it is generally observed in the year the 1st of August, since the alteration of the calendar in George III.'s reign. Its observance was in allusion to the custom that each worshipper should present in the church a loaf made of the new wheat as an offering of the first-fruits. A relic of the old "open-field" system of agriculture survives in the so-called "Lammas Lands." These were lands enclosed and held in severally during the growing of corn and grass and thrown open to pasture during the rest of the year for those who had common rights. These commoners might be the several owners, the inhabitants of a parish, freemen of a borough, tenants of a manor, &c. The opening of the fields by throwing down the fences took place on Lammas Day (12th of August) for corn-lands and on Old Midsummer Day (6th of July) for grass. They remained open until the following Lady Day. Thus, in law, "lammas lands" belong to the several owners in fee-simple subject for half the year to the rights of pastureage of other people (Baylis v. Tyson-Amherst, 1857, 6 Ch. D., 52). See further F. Seebohm, The English Village Community; C. I. Elton, Commons and Waste Lands; P. Vinogradoff, Village Life in England.

LÄMMERGEYER (Ger. Lämmereiger, Lamm, lamb, and Geler, vulture), or bearded vulture, the Falco barbatus of Linnaeus and the Gypaetes barbatus of modern ornithologists, one of the grandest birds-of-prey of the Palaearctic region—inhabiting lofty mountains, and feeding on carcasses which he finds on the borders of China, though within historic times it has been exterminated in several of its ancient haunts. Its northern range in Europe does not seem to have extended farther than the southern frontier of Bavaria, or the neighbourhood of Salzburg; but in Asia it formerly reached a higher latitude, having been found even so lately as 1830 in the Amur region where, according to G. F. Radde (Beitr. K no. u. Russ. Reichs, xxiii. p. 467), it has now left but its name. It is not uncommon on many parts of the Himalayas, where it breeds; and on the mountains of Kumaon and the Punjab, and is the "golden eagle" of most Anglo-Indians. It is found also in Persia, Palestine, Crete and Greece, the Italian Alps, Sicily, Sardinia and Mauritania.

In some external characters the lämmergeyer is intermediate between the families Vulturidae and Falconidae, and the opinion of systematists has from time to time varied as to its proper position. It is now generally agreed, however, that it is more closely allied with the eagles than with the vultures, and the sub-family Gypaetinae of the Falconidae has been formed to contain it.

The whole length of the bird is from 43 to 46 in., of which, however, about 20 are due to the long cuneiform tail, while the pointed wings measure more than 30 in. from the carpal joint to the tip. The top of the head is white, bounded by black, which, beginning in stiff bristly feathers turned forwards over the base of the beak, proceeds on either side of the face in a well-defined band to the eye, where it bifurcates into two narrow stripes, of which the upper one passes above and beyond that feature till just in front of the scalp it suddenly turns upwards towards the eye and runs on to the back part of the head. The corresponding stripe from the opposite side, enclosing the white forehead beforehand mentioned, while the lower stripe extends beneath the eye about as far backwards and then suddenly stops. A tuft of black, bristly feathers projects beardlike from the base of the mandible, and gives the bird one of its commonest epithets in many languages. The rest of the head, the neck, throat and lower parts generally are clothed with lanceolate feathers of a pale tawny colour—sometimes so pale as to be nearly white beneath; while the scapulars, back and wing-coverts generally, are of a glossy greyish-black, most of the feathers having a white shaft and a median tawny line. The quill-feathers, both of the wings and tail, are of a dark blackish-grey. The irides are of a light orange, and the sclerotic tunics—equivalent to the "white of the eye" in most animals—which in few birds are visible, are in this very conspicuous and of a bright scarlet, giving it an air of great gaiety. In the lower parts the neck and throat are clothed in dull black, and most of the feathers of the mantle and wing-coverts are broadly tipped and mesiately streaked with tawny or lightish-grey.

The lämmergeyer breeds early in the year. The nest is of large size, built of sticks, lined with soft material and placed on a ledge of rock—a spot being chosen, and often occupied for many years, which is nearly always difficult of access. Here in the month of February a single egg is usually laid. This is more than 3 in. in length by nearly \(\frac{1}{2}\) in. in breadth, of a pale but livelily brownish-orange. The young when in the nest are clad in down of a dirty white, varied with grey on the head and neck, and with ochraceous in the iliac region.

There is much discrepancy as to the ordinary food of the lämmergeyer, some observers maintaining that it lives almost exclusively on carrion, offal and even ordure; but there is no question of its frequently taking living birds, and it is therefore possible to suppose that this bird, like so many others, is not everywhere uniform in its habits. Its name shows it to be the reputed enemy of shepherds, and it is in some measure owing to their hostility that it has been exterminated in so many parts of its European range. But the lämmergeyer has also a great partiality for bones, which when small enough it swallows. When they are too large, it is said to soar with them to a great height and drop them on a rock or stone that they may be broken into pieces of convenient size. Hence its name ossifrage, by which the

2 Among other crimes attributed to the species is that, according to Pliny (Hist. Nat. x. cap. 3), of having caused the death of the poet Aeschylus, by dropping a tortoise on his bald head! In the
LAMOIGNON—LA MOTTE

Hebrew Peres is rightly translated in the Authorized Version of the Bible (Lev. xi. 15; Deut. xiv. 12)—a word importuned into osprey by applied to a bird which has no habit of the kind. The lammergeyer of north-eastern and south Africa is specifically distinct, and is known as Gypaetus meridionalis or G. nubiapat. In habits it resembles the northern bird, from which it differs in little more than wanting the black stripe below the eye and having the lower part of the tarsus bare of feathers. It is the "golden eagle" of Bruce's Travels, and has been beautifully figured by Joseph Wolf in E. Rüppell's Syst. Übers. der Vögel Nord-Ost-Afrika's (Taf. 1).

LAMOIGNON, a French family, which takes its name from Lamoignon, a place said to have been in its possession since the 13th century. One of its several branches is that of Lamoignon de Malesherbes. Several of the Lamoignons have played important parts in the history of France and the family has been specially distinguished in the legal profession. Guillaume de Lamoignon (1617-1677), attained eminence as a lawyer and became president of the parlement of Paris in 1658. First on the popular, and later on the royalist side during the Fronde, he presided at the earlier sittings of the parlement of Paris, and when he regarded as innocent, and he was associated with Colbert, whom he was able more than once to thwart. Lamoignon tried to simplify the laws of France and sought the society of men of letters like Boileau and Racine. Having received rich rewards for his public services, he died in Paris on the 10th of December 1677. Guillaume's second son, Nicolas de Lamoignon (1648-1724), took the surname of Basville. Following his hereditary calling he filled many public offices, serving as intendant of Montauban, of Pau, of Poitiers and of Languedoc before his retirement in 1718. His administration of Languedoc was chiefly remarkable for vigorous measures against the Camisards and other Protestants, but in other directions his work in the south of France was more beneficent, as, following the example of Colbert, he encouraged agriculture and industry generally and did something towards improving the means of communication. He wrote a Mémoire, which contains much interesting information about his public work. This was published at Amsterdam in 1724. Lamoignon, who is called by Saint Simon, "the king and tyrant of Languedoc," died in Paris on the 17th of May 1724. Chrétienn Francois de Lamoignon (1733-1789) entered public life at an early age and was an actor in the troubles which heralded the Revolution. First on the side of the parlement and later on that of the king he was one of the assistants of Laménié de Brienne, whose unpopularity and fall he shared. He committed suicide on the 15th of May 1789.

LAMONT, JOHANN VON (1803-1879), Scottish-German astronomer and magnetician, was born at Braemar, Aberdeenshire, on the 13th of December 1803. He was sent at the age of twelve to be educated at the Scottish monastery in Regensburg, and apparently never afterwards returned to his native country. His strong bent for scientific studies was recognized by the head of the monastery, P. Deasson, on whose recommendation he was admitted in 1827 to the then new observatory of Bogenhauser, where he remained for two years. After the death of his chief in 1835 he was, on H. C. Schumacher's recommendation, appointed to succeed him as director of the observatory. In 1832 he became professor of astronomy at the university of Munich, and held both these posts till his death, which took place on the 6th of August 1879. Lamont was a member of the academies of Brussels, Upsala and Prague, of the Royal Society of Edinburgh, of the Cambridge Philosophical Society and of many other learned corporations. Among his contributions to astronomy may be noted his eleven zone-catalogues of 34,674 stars, his measurements, in 1836-1837, of nebulae and clusters, and his determination of the mass of Uranus from observations of its satellites (Mem. Astron. Soc. xi. 51, 1838). A magnetic observatory was equipped at Bogenhauser.

Atlas range the food of this bird is said to consist chiefly of the Testudo marginata, which "carries to some height in the air, and lets fall on a stone to break the shell" (Ibis, 1859, p. 177). It was the Ἀριμέδ and Ὀμήρῳ of Greek classical writers.

Lausanne in 1840 through his initiative; he executed comprehensive magnetic surveys 1849-1858; announced the magnetic decennial chart in 1850, and his discovery of earth-currents in 1862. His Handbuch des Erdmagnetismus (Berlin, 1849) is a standard work on the subject.

LAMORICIÈRE, CHRISTOPHE LÉON LOUIS JUCHAULT DE (1866-1865), French general, was born at Nantes on the 11th of September 1806, and entered the Engineers in 1828. He served in the Algerian campaign from 1830 onwards, and by 1830 he had risen to the grade of major-general. Three years later he was made a general of division. He was one of the most distinguished and efficient of Bugeaud's generals, rendered special service at Isly (August 14, 1844), acted temporarily as governor-general of Algeria, and finally effected the capture of Abd el-Kader in 1847. Lamoricière took part in the punitive campaign of 1857 both as a member of the Chamber of Deputies and as a military commander. Under the régime of General Cavaignac he was for a time minister of war. From 1848 to 1851 Lamoricière was one of the most conspicuous opponents of the policy of Louis Napoleon, and at the coup d'état of the 2nd of December 1851 he was arrested and exiled. He refused to give in his allegiance to the emperor Napoleon III., and in 1860 accepted the command of the papal army, which he led in the Italian campaign of 1860. On the 18th of September of that year he was severely defeated by the Italian army at Castelfidardo. His last years were spent in complete retirement in France (he had been allowed to return in 1857), and he died at Prouzel (Somme) on the 11th of September 1865.

LA MOTTE LE VAYER, FRANÇOIS DE (1588-1672), French writer, was born in Paris of a noble family of Maine. His father was an orator at the parlament of Paris and author of a curious treatise on the functions of ambassadors, entitled Legatus, seu De legatorum privilegiis, officio et munere libellus (1739) and illustrated mainly from ancient history. François succeeded his father at the parlament, but gave up his post about 1647 and devoted himself to travel and belles lettres. His Considerations sur l'éloquence française (1638) procured him admission to the Academy, and his De l'instruction de Mgr. le Dauphin (1640) attracted the attention of Richelieu. In 1649 Anne of Austria entrusted him with the education of her second son and subsequently with the completion of Louis XIV.'s education, which had been very much neglected. The outcome of his pedagogic labours was a series of books comprising the Geographie, Rhetorique, Moral, Economique, Politique, Logique, and Physique du Prince (1651-1658). The king rewarded his tutor by appointing him historiographer of France and councillor of state. La Motte Le Vayer died in Paris. Modest, sceptical, and occasionally odd in his Latin pieces and in his verses, he made himself a personage in the French court, where libertinism in ideas and morals was hailed with relish. Besides his educational works, he wrote Jugement sur les anciens et principaux historiens grecs et latins (1640); a treatise entitled Du peu de certitude qu'il y a en histoire (1668), which in a sense marks the beginning of historical criticism in France; and sceptical Dialogues, published posthumously under the pseudonym of Orosius Tubero. An incomplete edition of his works was published at Dresden in 1756-1759.

See Bayle, Dictionnaire critique, article "Vayer"; L. Étiene, Essai sur La Motte Le Vayer (Paris, 1849).

LA MOTTE, ANTOINE HOUDEAR DE (1672-1731), French author, was born in Paris on the 18th of January 1672. In 1693 his comedy Les Originaux proved a complete failure, which so depressed the author that he contemplated joining the Trappists, but four years later he again began writing operas and ballets, e.g. L'Europe galante (1697), and tragedies, one of
LAMOUREUX—LAMP

which, Intès de Castro (1723), was produced with immense success at the Théâtre Français. He was a champion of the moderns in the revived controversy of the ancients and moderns. Madame Dacier had published (1699) a translation of the Iliad, and La Motte, who knew no Greek, made a translation (1714) in verse founded on her work. The nature of his work may be judged from his own expression: "I have taken the liberty to change what I thought disagreeable in it." He defended the moderns in the Discours sur Homère prefixed to his translation, and in his Réflexions sur la critique (1716). Apart from the merits of the controversy, it was conducted on La Motte's side with a wit and politeness which compared very favourably with his opponent's methods. He was elected to the Academy in 1716, and soon after became blind. La Motte carried on a correspondence with the duchesse du Maine, and was the friend of Fontenelle. He had the same freedom from prejudice, the same inquiring mind as the latter, and it is on the excellent prose in which his views are expressed that his reputation rests. He died in Paris on the 26th of December 1731.

LAMOUREUX, CHARLES (1834-1899), French conductor and violinist, was born at Bordeaux on the 28th of September 1834. He studied at the Pau Conservatoire, was engaged as violinist at the Opéra, and in 1864 organized a series of concerts devoted to chamber music. Having journeyed to England and assisted at a Handel festival, he thought he would attempt something similar in Paris. At his own expense he founded the "Société de l'Harmonie Sacrée," and in 1873 conducted the first performance in Paris of Handel's Messiah. He also gave performances of Bach's St Matthew Passion, Handel's Judas Maccabaeus, Gounod's Galilla, and Massenet's Eve. In 1873 he conducted the festival given at Rouen to celebrate the centenary of Boieldieu. The following year he became chef d'orchestre at the Opéra Comique. In 1881 he founded the famous concerts associated with his name, which contributed so much to popularize Wagner's music in Paris. The performances of detached pieces taken from the German master's works did not, however, satisfy him, and he matured the project to produce Lohengrin, which at that time had not been heard in Paris. For this purpose he took the Eden Theatre, and on the 3rd of May 1887 he conducted the first performance of Wagner's opera in the French capital.

Owing to the opposition of the Chauvinists, the performance was not repeated; but it doubtless prepared the way for the production of the same masterpiece at the Paris Opéra a few years later. Lamoureux was successively second chef d'orchestre at the Conservatoire, first chef d'orchestre at the Opéra Comique, and twice first chef d'orchestre at the Opéra. He visited London on several occasions, and gave successful concerts at the Queen's Hall. Lamoureux died at Paris on the 21st of December 1899. Tristan und Isolde had been at last heard in Paris, owing to his initiative and under his direction. After conducting one of the performances of this masterpiece he was taken ill and succumbed in a few days, having had the consolation before his death of witnessing the triumph of the cause he had so courageously championed.

LAMP (from Gr. λαμπή, a torch, λαμπεῖν, to shine), the general term for an apparatus in which some combustible substance, generally for illuminating purposes, is held. Lamps are usually associated with lighting, though the term is also employed in connexion with heating (e.g. spirit-lamp); and as now employed for oil, gas and electric light, they are dealt with in the article Lighting. From the artistic point of view, in modern times, their variety precludes detailed reference here; but their archaeological history deserves a fuller account.

Ancient Lamps.—Though Athenaeus states (xiv. 700) that the lamp (λάμπος) was not an ancient invention in Greece, it had come into general use there for domestic purposes by the 4th century B.C., and no doubt had long before been employed for temples or other places where a permanent light was required in room of the hour of Homeric times. Herodotus (li. 62) sees nothing strange in the "festival of lamps," Lychnokai, which was held at Sais in Egypt, except in the vast number of them. Each was filled with oil so as to burn the whole night. Again he speaks of evening as the time of lamps (ἐπὶ Λυχνοὺς, vii. 215). Still, the scarcity of lamps in a style anything like that of an early period, compared with the immense number of them from the late Greek and Roman age, seems to justify the remark of Athenaeus. The commonest sort of domestic lamps were of terra-cotta and of the shape seen in figs. 1 and 2 with a spout or nozzle (μυχή) in which thewick (βρόνταλλος) burned, a round hole on the top to pour in oil by, and a handle to carry the lamp with. A lamp with two or more spouts was διωνός, τριωνός, &c., but these terms would not apply strictly to the large class of lamps with numerous holes for wicks but without nozzles.

Decoration was confined to the front of the handle, or more commonly to the circular space on the top of the lamp, and it consisted almost always of a design in relief, taken from mythology or legend, from objects of daily life or scenes such as displays of gladiators or chariot races, from animals and the chase. A lamp in the British Museum has a view of the interior of a Roman circus with spectators looking on at a chariot race. In other cases the lamp is made altogether of a fantastic shape, as in the form of an animal, a bull's head, or a human foot. Naturally colour was excluded from the ornamentation except in the form of a red or black glaze, which would resist the heat. The typical form of hand lamp (figs. 1, 2) is a combination of the flatness necessary for carrying steady and remaining steady when set down, with the roundness evolved from the working in clay and characteristic of vessels in that material. In the bronze lamps this same type is retained, though the roundness was less in keeping with metal. Fanciful shapes are equally common in bronze. The standard form of handle consists of a ring for the forefinger and above it a kind

FIG. 1.

FIG. 2.

FIG. 3.
This lamp was refilled on exactly the same day each year, so that there seems to have been an idea of measuring time by it, such as may also have been the case in regard to the lamp stand (Ἄγγελος) capable of holding as many lamps as there were days of the year, which Dionysius the Sicilian tyrant placed in the Prytaneum of Tarentum. At Pharae in Achaea there was in the market-place an oracular statue of Hermes with a marble altar before it to which bronze lamps were attached by means of lead. Whoever desired to consult the statue went there in the evening and first filled the lamps and lit them, placing also a bronze coin on the altar. A similar custom prevailed at the oracle of Apis in Egypt (Pausanias vii. 22. 2). At Argos he speaks of a chasm into which it was a custom continued to his time to let down burning lamps, with some reference to the goddess of the lower world, Persephone (ii. 22. 4). At Cnidus a large number of terra-cotta lamps were found crowded in one place a little distance below the surface, and it was conjectured that there must have been there some statue or altar at which it had been a custom to leave lamps burning at night (Newton, Discoveries at Halicarnassus, &c., ii. 394). These lamps are of terra-cotta, but with little ornamentation, and so good a workmanship that they must all have come from one pottery, and may have been all brought to the spot where they were found on one occasion, probably the funeral of a person with many friends, or the celebration of a festival in his honour, such as the parentalia among the Romans, to maintain which it was a common custom to bequeath property. For example, a marble slab in the British Museum has a Latin inscription describing the property which had been left to provide among other things that a lighted lamp with incense on it should be placed at the tomb of the deceased on the kalends, nones, and ides of each month (Mus. Marbles, v. pl. 8, fig. 2). For birthday presents terra-cotta lamps appear to have been frequently employed, the device generally being that of two figures of victory holding between them a disk inscribed with a good wish for the new year: ANNVS NOVVS FAVSTVS FELIX. This is the inscription on a lamp in the British Museum, which besides the victories has among other symbols a disk with the head of Janus. As the torch gave way to the lamp in fact, so also it gave way in mythology. In the earlier myths, as in that of Demeter, it is a torch with which she goes forth to search for her daughter, but in the late myth of Cupid and Psyche it is an oil lamp which Psyche carries, and from which to her grief a drop of hot oil falls on Cupid and awakes him. Terra-cotta lamps have very frequently the name of the maker stamped on the foot. Clay moulds from which the lamps were made exist in considerable numbers.

(L. S. M.)

**LAMP-BLACK.** A deep black pigment consisting of carbon in a very fine state of division, obtained by the imperfect combustion of highly carbonaceous substances. It is manufactured from scraps of resin and pitch refuse and inferior oils and fats, and other similar combustible bodies rich in carbon, the finest lamp-black being procured by the combustion of oils obtained in coal-tar distillation (see COAL-TAR). Lamp-black is extensively used in the manufacture of printing ink, as a pigment for oil painting and also for "ebonizing" cabinet work, and in the waxing and lacquering of leather. It is the principal constituent of China ink.

**LAMPEDUSA.** A small island in the Mediterranean, belonging to the province of Girgenti, from which it is about 112 m. S.S.W. Pop. (1901, with Linosa—see below) 2276. Its greatest length is about 7 m., its greatest width about 2 m.; the highest point is 400 ft. above sea-level. Geologically it belongs to Africa, being situated on the edge of the submarine platform which extends along the east coast of Tunisia, from which (at Mahdia) it is 90 m. distant eastwards. The soil is calcareous; it was covered with cedr (chiefly the wild olive) until comparatively recent times, but this has been cut, and the rock is now bare. The valleys are, however, fairly fertile. On the south, near the only village, is the harbour, which has been dredged to a depth of 13 ft. and is a good one for torpedo boats and small craft.

The island was, as remains of hot foundations show, inhabited...
in prehistoric times. Punic tombs and Roman buildings also exist near the harbour. The island is the Lopadusa of Strabo, and the Lipudasa of Ariosto's Orlando Furioso, the scene of the landing of Roger of Sicily and of his conversion by the hermit. A thousand slaves were taken from it in its population in 1553. In 1436 it was given by Alfonso of Aragon to Don Giovanni de Caro, baron of Montechiaro. In 1661, Ferdinand Tommasi, its then owner, received the title of prince from Charles II. of Spain. In 1737 the earl of Sandwich found only one inhabitant upon it; in 1760 some French settlers established themselves there. Catherine II. of Russia proposed to buy it as a Russian naval station, and the British government thought of doing the same if Napoleon had succeeded in seizing Malta. In 1800 a part of it was leased to Salvatore Gatt of Malta, who in 1810 sublet part of it to Alessandro Fernandez. In 1843 onwards Ferdinand II. of Naples established a colony there. There is now an Italian penal colony for domicilio coatto, with some 400 convicts (see B. Sannisente, l'isola di Lampedusa cattiva colonia, Naples, 1849). Eight miles W. is the islet of Lampione, Linosa, some 30 m. to the N.N.E., measures about 2 by 2 m., and is entirely volcanic; its highest point is 610 ft. above sea-level. Pop. (1901) about 200. It has landing-places on the S. and W., and is more fertile than Lampedusa; but it suffers from the lack of springs. Sannisente says the water in Lampedusa is good. A few fragments of undoubtedly Roman pottery and some Roman coins have been found there, but the cisterns and the ruins of houses are probably of later date (P. Calcaria, Descrizione dell' isola di Linosa, Palermo, 1851, 29). (T. A.)

LAMPERTHEIM, a town in the grand-duchy of Hesse-Darmstadt, 8 m. N. from Mannheim by the railway to Frankfort-on-Main via Biblis, and at the junction of lines to Worms and Weilheim. It contains a Roman Catholic church and a fine Evangelical church, and has chemical and cigar factories. Pop. (1890) 9,250.

LAMPERTHEIM—LAMPERY

LAMPERTHEIM, a town in the grand-duchy of Hesse-Darmstadt, 8 m. N. from Mannheim by the railway to Frankfort-on-Main via Biblis, and at the junction of lines to Worms and Weilheim. It contains a Roman Catholic church and a fine Evangelical church, and has chemical and cigar factories. Pop. (1890) 9,250.

LAMPERY (Llandeby-Stephan), a market town, municipal borough and assize town of Cardiganshire, Wales, on the right bank of the Teifi, here crossed by an ancient stone bridge. Pop. (1901) 1,722. Lampeter is a station on the so-called Manchester-and-Milford branch line of the Great Western railway. Though of ancient origin, the town is entirely modern in appearance, its most conspicuous object being the Gothic buildings of St David's College, founded in 1822, which cover a large area and contain a valuable library of English, Welsh and foreign works (see Universities). The modernized parish church of St Peter, or Pedr, contains some old monuments of the Lloyd family. North of the town are the park and mansion of Faldonale, the seat of the Harford family.

The name of Llandeby-Stephan goes to prove the early foundation of the place by St Peter, a Celtic missionary of the 6th century, while one Stephen was the original builder of the bridge over the Teifi. As an important outpost in the upper valley of the Teifi, Lampeter possessed a castle, which was demolished by Owen Gwynedd in the 12th century. In 1188 the town was visited by Archbishop Baldwin on his way from Cardigan to Strata-Florida Abbey, and the Crusade was vigorously preached at this spot. Lampeter was first incorporated under Edward II., but the earliest known charter dates from the reign of Henry VI., whereby the principal officer of the town, a portreeve, was to be appointed annually at the court-least of the manor. The town was subsequently governed under a confirmatory charter of 1814, but in 1864 a new charter was obtained, whereby the corporation was empowered to consist of a mayor, 4 aldermen and 12 councillors. Although only a small agricultural centre, Lampeter has since 1886 become the administrative centre of Cardiganshire owing to its convenient position. Until the Redistribution Act of 1885 Lampeter formed one of the group of boroughs comprising the Cardigan parliamentary district.

LAMPOON, a virulent satire either in prose or verse; the idea of injustice and unscrupulousness seems to be essential to its definition. Although in its use the word is properly and almost exclusively English, the derivation appears to be French. Littre derives it from a term of Parisian argot, lamper, to drink greedily, in great mouthfuls. This word appears to have been prevalent in the middle of the 17th century, and Furetière has preserved a fragment from a popular song, which says:

Jacques fuyant de Dublin
Dit à Lauzun, son cousin,
"Prenez soin de ma couronne,
J'aurai soin de ma personne,
Lampons, lampons, lampons!!!
—that is to say, let us drink heavily, and begone dull care. Scarron speaks of a wild troop, singing liridas and lampoons.

There is, also, a rare French verb, lampooner, to attack with ridicule, used earlier in the 17th century by Brantôme. In its English form, lampoon, the word is used by Evelyn in 1645, "Here they still paste up their drollling lampoons and scurrilous papers," and soon after it is a verb,—" suppose we lampooned all the pretty women in Town." Both of these forms, the noun and the verb, have been preserved ever since in English, without modification, for violent and reckless literary censure. Tom Brown (1663-1704) was a past master in the art of lampooning, and some of his attacks on the celebrities of his age have a certain vigour. When Dryden became a Roman Catholic, Brown wrote:

Traitor to God and rebel to thy pen,
Priest-ridden Poet, perjured son of Ben,
If ever thou prove honest, then the nation
May modestly believe intransubstantiation.

Several of the heroes of the Dunciad, and in particular John Oldmixon (1673-1742), were charged without unfairness with being professional lampooners. The coarse diatribes which were published by Richard Savage (1697-1743), mainly against Lady Macclesfield, were nothing more nor less than lampoons, and the word may with almost equal justice be employed to describe the coarser and more personal portions of the satires of Churchill. As a rule, however, the lampoon possessed no poetical graces, and in its very nature was usually anonymous. The notorious Essay on Woman (1794) of John Wilkes was a lampoon, and was successfully proceeded against as an obscene libel. The progress of civilization and the discipline of the law made it more and more impossible for private malice to take the form of baseless and scurrilous attack, and the lampoon, in its open shape, died of public decency in the 18th century. Malice, especially in an anonymous form, and passing in manuscript from hand to hand, has continued, however, to make use of this very unlovely form of literature. It has constantly reappeared at times of political disturbance, and the French have seldom failed to exercise their wicked wit upon their unpopular rulers.

See also Pasquinade.

LAMPREY, a fish belonging to the family Pteromyzonidae (from ἀριθμος and μεσα, literally, stone-suckers), which with the hog-fishes or Myxinidae forms a distinct subclass of fishes, the Cyclostomata, distinguished by the low organization of their skeleton, which is cartilaginous, without vertebral segmentation, without ribs or real jaws, and without limbs. The lampreys are readily recognized by their long, eel-like, scaleless body, terminating anteriorly in the circular, sectorial mouth characteristic of the whole sub-class. On each side, behind the head, there is a row of seven branchial openings, through which the water is conveyed to and from the gills. By means of their mouth they fasten to stones, boats, &c., as well as to other fishes, their object being to obtain a resting-place on the former, whilst they attach themselves to the latter to derive nourishment from them. The inner surface of their cup-shaped mouth is armed with pointed teeth, with which they perforate the integuments of the fish attacked, scraping off particles of the flesh and sucking the blood. Mackerel, cod, pollack and flat-fishes are the kinds most frequently attacked by them in the sea; of river-fish the migratory Salmonidae and the shad are sometimes found with the marks of the teeth of the lamprey, or with the fish actually attached to them. About fifteen species are known from the coasts and rivers of the temperate regions of the northern and southern hemispheres. In Great Britain and Europe generally three species occur, viz. the large spotted

...
LAMPROPHYRES

sea-lamprey (Petromyzon marinus), the river-lamprey or lamper (P. fluviatilis), and the small lamper or "pride" or "sand-piper" (P. branchialis). The first two are migratory, entering rivers in the spring to spawn; of the river-lamprey, however, specimens are met with in fresh water all the year round. In North America about ten species of lamprey occur, while in South America and Australasia still others are found. Lampreys, especially the sea-lamprey, are esteemed as food, formerly more so than at present; but their flesh is not easy of digestion. Henry I. of England is said to have fallen a victim to this, his favourite dish. The species of greatest use is the river-lamprey, which as bait is preferred to all others in the cod and turbot fisheries of the North Sea. Yarrell states that formerly the Thames alone supplied from 1,000,000 to 1,200,000 lampreys annually, but their number has so much fallen off that, for instance, in 1876 only 40,000 were sold to the cod-fishers. That year, however, was an unusually bad year; the lamperns, from their scarcity, fetched £5, universal, as sand, whilst in ordinary years £5 is considered a fair price. The season for catching lamperns closes in the Thames about the middle of March. The origin of the name lamprey is obscure; it is an adaptation of Fr. lamproie, Med. Lat. lamprea; this has been taken as a variant of another Med. Lat. form Lamperio, which occurs in ichthyological works of the middle ages; the derivation from lamperio petras, to lick stones, is a specimen of etymological ingenuity. The development of lampreys has received much attention on the part of naturalists, since Avg. Muller discovered that they undergo a metamorphosis, and that the minute worm-like lamperns previously known under the name of Ammocoetes, and abundant in the sand and mud of many streams, were nothing but the undeveloped young of the river-lampreys and small lamperns. 

LAMPROPHYRES (from Gr. λαμπρος, bright, and the terminal part of the word porphyry, meaning rocks containing bright porphyritic crystals), a group of rocks containing phenocrysts, usually of biotite and hornblende (with bright cleavage surfaces), often also of olivine and augite, but not of felspar. They are thus distinguished from the porphyries and porphyrites in which the felspar has crystallized in two generations. They are essentially "dike rocks," occurring as dikes and thin sills, and are also found as marginal facies of plutonic intrusions. They furnish a good example of the correlation which often exists between petrographical types and their mode of occurrence, showing the importance of physical conditions in determining the mineralogical and structural characters of rocks. They are usually dark in colour, owing to the abundance of ferro-magnesian silicates, of relatively high specific gravity and liable to decomposition. For these reasons they have been defined as a melanocratic series (rich in the white minerals felspar and quartz) such as alpites, porphyrites and felsites. Both have been produced by differentiation of a parent magma, and if the two complementary sets of rocks could be mixed in the right proportions, it is presumed that a mass of similar chemical composition to the parent magma would be produced.

Both in the hand specimens and in microscopic slides of lamprophyric rocks biotite and hornblende are usually conspicuous. Though black by reflected light they are brown by transmitted light and highly pleochroic. In some cases they are yellow-brown, in other cases chestnut-brown and reddish brown; in the same rock the two minerals have strikingly similar colour and pleochroism. Augite, when it occurs, is sometimes green, at other times purple. Felspar is restricted to the ground mass; quartz occurs sometimes but is scarce. Although porphyritic structure is almost universal, it is sometimes not very marked. The large biotites and hornblendes are not sharply distinct from those of intermediate size, which in turn graduate into the small crystals of the same minerals in the ground mass. As a rule all the ingredients have rather perfect crystalline forms (except quartz), hence these rocks have been called "pandiomorphic." In many lamprophyres the pale quartz and felspathic ingredients tend to occur in rounded spots, or ocelli, in which there has been progressive crystallization from the margins towards the centre. These spots may consist of radiate or brush-like felspars (with some mica and hornblende) or of quartz and felspar. A central area of quartz or of analcime probably represents an original miarolitic cavity infilled at a later period.

There are two great groups of lamprophyres differing in composition while retaining the general features of the class. One of these comprises intrusions of granite and diorite and includes the minettes, kersantites, vogesites and spessartites. The other is found in association with nepheline syenites, essxites and teschenites, and is exemplified by campotites, monchiquites and aholites. The complementary facies of the first group is the alpites, porphyrites and felsites; that of the second group includes bostonites, tinguites and other rocks.

The granito-dioritic-lamprophyres (the first of these two groups) are found in many districts where granites and diorites occur, e.g. the Scottish Highlands and Southern Uplands, the Lake district, Ireland, the Vosges, Black Forest, Harz, &c. As a rule they do not proceed directly from the granite, but form separate dikes which may be later than, and consequently may cut, the granites and diorites.

The lamprophyres, which occur in this group, consist of three distinct subdivisions which are included under the general name of lamprophyres, as a whole is a well-characterized one and shows few transitions to porphyries, porphyrites and other dike types; their subdivisions, however, tend to merge into one another and especially when they are weathered hard to differentiate. The presence or absence of the four dominant minerals, orthoclase, plagioclase, biotite and hornblende, determines the species. Minettes contain biotite and orthoclase; kersantites, biotite and plagioclase. Vogesites contain hornblende and orthoclase; spessartites, hornblende and plagioclase. Each variety of lamprophyre may and often does contain all four minerals but is named according to the two which preponderate. These rocks contain also iron oxides (usually titaniferous magnetite) and often apatite, chromite, leucite, yellow quartz, mica, etc. The rock is usually well-characterized as a whole, and a rule they contain all four minerals and are very perfect and give the micro-sections an easily recognizable character. Green hornblende occurs in some of these rocks; the crystals of this hornblende may be of green colour, often zonal and readily weathering. Olivine in the fresh state is rare; it forms rounded, corroded grains; in many cases it is decomposed to green or colourless hornblende in radiating nests (pilly lamprophyre). The orthoclase is usually square (paprite) and in some cases may show the lamprophyre may have similar shapes or may be fibrous and grouped in sheaf-like aggregates which are narrow in the middle and spread out towards both ends. If at all present it is the last product of crystallization and consists almost entirely of orthoclase crystals. Other enclosing, more certainly of foreign origin, are often seen, such as quartzite, schists, garnetiferous rocks, granite, &c. These may be falked and altered or in other cases partly dissolved. Cordierite may be the former if they are in the rocks or in the lamprophyre, where it takes the shape of hexagonal prisms which in polarized light break up into six sectors, triangular in shape, diverging from the centre of the crystal.

The second group of lamprophyre dikes rocks (the campotitones, monchiquites, olinites series) is much less common than those above described. As a rule they occur together, and there are transitions between the different sub-groups as in the granito-dioritic lamprophyres. In Sweden, Brazil, Portugal, Norway, the Black Forest, and Holland, Arkansas and Wisconsin the intergradation of rock types has been met with, always presenting nearly identical features. In most cases, though not in all, they have a close association with nepheline or leucite syenites and similar rocks rich in alkalis. This is an indication of a genetic affinity that while exists between the granites and the minettes, &c., and further proof of this connexion is furnished.
LAMPSACUS—LANARKSHIRE

by the occasional occurrence in those lamprophyres of leucite, halyne and other felspathoid minerals.

The campotrites (called after Campot, New Hampshire) are dark brown, nearly black rocks often with large hornblende phenocrysts. Their essential minerals in thin section are hornblende of a strong reddish-brown colour; augite, pleochroic and rich in titanium, olivine and plagioclase felspar. They have the porphyritic and plagioclasmorphic structures described in the rocks of the previous group and like them also have a pyroxene character, often very conspicuous under the microscope. The accessory minerals are biotite, apatite, iron oxides and analcite. They decompose readily and are then filled with carbonates. Many of these rocks prove on analysis to be hornblende-rich in titanium; they may contain 4 or 5% of titanium dioxide.

The monchiquites (called after the Serra de Monchique, Portugal) are fine-grained and devoid of felspar. Their essential constituents are olivine and pyroxene, augite, hornblende, like that of the campotrites in many of them. An interstitial substance is present, which may sometimes be a brown glass, but at other times is colourless and is believed by some petrographers to be primary crystalline analcite. They would define the monchiquites as rocks consisting of olivine, augite and analcite; others regard the analcite as secondary, and consider the base as essentially glassy. Some monchiquites contain halyne; while in others small leucites are found. Occular structure is occasionally present, though less marked than in the campotrites. A special group of monchiquites rich in deep brown biotite has been called fourchites (after the Fourche Mountains, Arkansas).

The aloxites (called after the island of Alno in Norway) are rare rocks found in Norway, Iceland, the isle of Man, and other parts of North America, and in the north of Scotland. They contain olivine, augite, brown biotite and mellite. They are free from felspar, and contain very low percentages of silica.

The chemical composition of some of these rocks will be indicated by the analyses of certain well-known examples.

In addition to the oxides given these rocks contain small quantities of water (combined and hygroscopic), CO₂, S, MnO, PbO, CaO, SiO₂, etc.

LAMPSACUS, an ancient Greek colony in Myrina, Asia Minor, is named from the Pityusa or Pityussa before its colonization by Ionian Greeks from the Phocaeans and Milesians, was situated on the Hellespont, opposite the island of Lemnos (Gallipoli) in Thrace. It possessed a good harbor; and the neighborhood was famous for its wine, that, having fallen into the hands of the Persians during the Ionian revolt, it was assigned by Artaxerxes I to Themistocles to provide him with wine, as Percote did with meal and Magnisia with bread. After the battle of Mycale (479 B.C.), Lampsacus joined the Athenians, but, having revolted from them in 411, was reduced by force. It was defended in 106 B.C. against Antiochus the Great of Syria, after which its inhabitants were received as allies of Rome. Lampsacus was the chief seat of the worship of Priapus, a gross nature-god closely connected with the culture of the vine. The ancient name is preserved in that of the modern village of Lapsaki, but the Greek town possibly lay at Chardak immediately opposite Gallipoli.

See A. L. Castellan, Lettres sur la Morte, l'Hellespont, &c. (Paris, 1820); Choiseul Gouffier, Voyage pittoresque dans l'Empire ottoman (1842).

LAMPSAND, a pillar, tripod or figure extending to the floor for supporting or holding a lamp. The lampstand (lampsādē) is probably of French origin; it appears to have been in use in France before the end of the 17th century.

LANARK, a royal, municipal and police burgh, and county-town of Lanarkshire, Scotland, standing on high ground about half a mile from the right bank of the Clyde, 31 m. S.E. of Glasgow by the Caledonian railway. Pop. (1901) 44,850. It was the site of an ancient monastery, three hospitals, a convalescent home, the Symbilum orphanage and the Queen Victoria Jubilee fountain. The industries include cotton-spinning, weaving, nail-making and oilworks, and there are frequent markets for cattle and sheep. Lanark is a place of considerable antiquity. Kenneth II. held a parliament here in 978, and it was sometimes the residence of the Scottish kings, one of whom, William the Lion (d. 1214), granted it a charter. Several of the earlier exploiters of William Wallace were achieved in the neighbourhood. He burned the town and slew the English sheriff William Hezedrig. About 1 m. N.W. are Cardlaw Craigs, where Mouse Water runs through a precipitous red sandstone ravine, the sides of which are about 400 ft. high. The stream is crossed by a bridge of single span, supposed to be Roman, and by a three-arched bridge, designed by Thomas Telford and erected in 1823. On the right bank, near this bridge, is the cave in which Wallace concealed himself after killing Allen Cousart (the 'Wig') and which still bears his name. Lanark was the centre of much activity in the days of the Covenanters. William Lithgow (1582—1645), the traveller, William Smellie (1697—1763), the obstetrician and Gavin Hamilton (1730—1797), the painter, were born at Lanark. The town is one of the Falkirk district group of parliamentary burghs, the other constituents being Airdrie, Hamilton, Falkirk and Linlithgow.

New Lanark (pop. 795), 1 m. S., is famous in connexion with the social experiments of Robert Owen. The village was founded by David Dale (1730—1806) in 1785, with the support of Sir Richard Arkwright, inventor of the spinning-frame, who thought the spot might be made the Manchester of Scotland. In ten years four cotton mills were running, employing nearly 1,500 hands. They were sold in 1799 to a Manchester company, who appointed Owen manager. In the same year he married Dale's daughter. For many years the mills were successfully conducted, but, fiction ultimately arose and Owen retired in 1828. The mills, however, are still carried on.

There are several places near Lanark. Braxfield, on the Clyde, gave the title of Lord Braxfield to Robert Macqueen (1722—1799), who was born in the mansion and acquired on the bank the character of the Scottish Jeffreys. Robert Baillie, the patriot who was in consequence 'taken' (1764) and afterwards banished, had an estate on the Clyde. The house, the home of the Lockharts, is 3 m. N.W. The old castle was largely rebuilt in the 19th century. It contains some fine tapestry and portraits, and the Lee-Penny—Lockhart family is among the oldest in Scotland. The Lowther castle was long a seat of the Lowthers of Lowther, who left many of the Lowthers of Lowther castle, &c. It is described as a cornelian encased in a silver coin. Craignethan Castle on the Nethan, a left-hand tributary joining the Clyde at Crossford, is said to be the original of 'the Tilledudem of Scott's Old Mortality.'

LANARKSHIRE, a south-western county of Scotland, bounded N. by the shires of Dumbarton and Stirling, E. by Linlithgowshire, Midlothian and Peeblesshire, S. by Dumfrieshire and W. by the counties of Ayr, Renfrew and Dumbarton. Its area is 870 sq. m. (562,821 acres). It may be described as embracing the valley of the Clyde; and, in addition to the gradual descent from the high land in the south, it is also characterized by a gentle slope towards both banks of the river. The river is divided into three wards, the Upper, comprising all the southern section, or more than half the whole area (over 330,000 acres); the Middle, with Hamilton for its chief town, covering fully 100,000 acres; and the Lower, occupying the northern area of about 40,000 acres. The surface falls gradually from the uplands in the south to the Firth of Clyde. The highest hills are nearly all on or close to the borders of Peeblesshire and Dumfriesshire, and include Culter Fell (2454 ft.) and Lowther Hill (2377 m.). The loveliest heights exclusively belonging to Lanarkshire are Green Lowther (2409 ft.), Tinto (2353 ft.), Ballen- leuch Law (2267 ft.), Rodger Law (2257 ft.), Dum Law (2145 ft.), Shiel Dod (2095 ft.), Dungrain Law (2186 ft.) and Comb Law (2167 ft.). The principal rivers are the Clyde and its head waters and affluents (on the right, the Medwin, Mouse, South Calder, North)
Clyde and Kelvin, on the left, the Douglas, Nithand, Avon, Rotten Clyde and Cart). There are no lochs of considerable size, the few short watercourses in the north—Woodend Reservoir, Blaxland Loch, Hagganfield Loch, Woodend Loch, Lochend Loch—mainly feeding the Monkland and the Forth and Clyde Canals. The most famous natural features are the Falls of Clyde at Bonnington, Corra, Dunder and Stonelies.

Geology.—The southern upland portion is built up of Silurian and Ordovician rocks and the valleys between them are composed of Carboniferous and Old Red Sandstone rocks. Ordovician strata cross the county from S.W. to N.E. in a belt 5-7 m. in breadth which is brought up by a fault against the Old Red and the Silurian on the right and the Carboniferous on the left. Carnworth and Crawfordjohn. The Ordovician rocks lie in a synclinal fold with beds of Caradoc age in the centre flanked by Gratopotisl shales, grits and conglomerates, including among the last-named the local "Hagganfield Shale," and the Lower Silurian in the vicinity. In these formations, Silurian shales and sandstones, &c., extend south of the Ordovician belt to the county boundary; and again, on the northern side of the Ordovician belt two small tracts appear through the Old Red Sandstone and Lower Carboniferous rocks. The Old Red Sandstone covers an irregular tract north of the Ordovician belt; a lower division consisting of sandstone, conglomerates and mudstones is the most extensively developed; above this is a series of contemporaneous porphyrites and mafic metamorphosed rocks. It is not so extensive in the county but are not so in the east. An upper series of sandstones and grits is seen for a short distance west of Lamington. Lanark stands on the Old Red Sandstone and the Falls of Clyde occur in the same rocks. Essentially it is the same formation seen on the southern side of the basin of the Glasgow district. The axis of this basin lies in a N.E.-S.W. direction: in the central part, including Glasgow, Airdrie, Motherwell, Wishaw, Carluke, the coal-measures, consisting of sandstones, shales, marls and freckles with seams of coal and ironstone. There are eleven beds of workable coal, the more important seams being the Ell, Main, Splint, Poynt and Virtue. Underlying the coal-measures is the Millstone Grit seen on the northern side between Carnworth and Hagganfield—here the freeways of Garnkirk, Carnworth and Gallowfie are worked—and on the south and south-east of the coal-measures, but not on the west side, because it is there cut out by a fault. Beneath the last-named formation comes the Carboniferous rocks containing the coal-measures, the Lower Carboniferous rocks, and the Upper Carboniferous rocks. Beneath this is the Coaliferous sandstone series which in the south-east consists of sandstones, shales, &c., but in the west the greater part of the series is composed of interbedded volcanic rocks, porphyrites and mafic metamorphosed rocks. In the district of the older Older Breakdown, these volcanic rocks are the younger formations lie nearer the centre of the basin and the older ones crop out around them. Besides the volcanic rocks mentioned there are intrusive lites in the Carboniferous rocks that lie in the northern part of the district and the general distribution of the rocks is as follows:

The apples and pears are of good repute. There has been a remarkable extension in the culture of strawberries, hundreds of acres being laid down in beds. The sheep walks in the upper middle and upper of the county are extensive, the breeds being Ayrshire and a cross between this and "improved Lanark." Dairy-farming flourishes, the cheeses of Carnworth and Leshagh are in steady demand. Clydesdale draught-horses are of local origin and are extensively used. Pigs are extensively reared by the miners. The largest farm is situated in the Upper Ward, but the general holding runs from 50 to 100 acres. More than 25,000 acres are under wood.

Other Industries.—The leading industries are those in connection

with the rich and extensive coal and iron field to the east and south-east of Glasgow; the shipbuilding at Govan and Partick and in Glasgow harbour; the textiles at Airdrie, Blantyre, Hamilton, Lanark, New Lanark, Rutherglen and Glasgow; engineering at Clydebank, Rutherglen and Cambuslang; railway engineering at Motherwell and Wishaw, and the varied and flourishing manufactories centred in and around Glasgow.

Communications.—In the north of the county, where population is more dense and the mineral field exceptionally rich, the rail facilities are greatly developed, there being for 10 or 12 m. around Glasgow quite a network of lines. The Caledonian Railway Company's main line to the south runs through the whole length of the shire, sending daily passenger trains between Airdrie and Motherwell through to Glasgow and Newton, or through to Hamilton, and the new Mid-Lanark branch line through to Rutherglen. The North British Railway Company serves various towns in the lower and middle wards and its lines to Edinburgh cross the north-western corner and the north of the county. Only in the immediate vicinity of Glasgow is the Mid-Lanark railway the system compete for Lanarkshire traffic, though it combines with the Caledonian to work the Mid-Lanarkshire and Ayrshire railway. The Monkland Canal in the far north and the Forth and Clyde Canal in the north-east carry a considerable amount of goods, and the days of railways afforded one of the principal means of communication between east and west.

Population and Administration.—The population amounted in 1891 to 1,052,698, in 1901 to 1,339,327, or 1523 persons to the square mile. As though only in the south, this is the most populous county in Scotland, containing within its bounds nearly one-third of the population of the country. In 1901 there were 102 persons speaking Gaelic, and 26,909 speaking Gaelic in the parish of Carnwath, west from Glasgow, are Airdrie, 22,288, Cambuslang (12,252), Coatbridge (36,991), Govan (22,174), Hamilton (32,775), Kinning Park (13,852), Larkhall (11,879), Motherwell (30,415), Partick (54,268), Rutherglen (17,367), and Loanhead (42,861). Small towns such as the Belloills, some of which are Balliol, Carluke, Holytown, Lanark, Stonefield, Tollcross and Uddingston; and Lesmahagow and East Kilbride are populous villages and mining centres. The county is divided into six police districts: Coatbridge, Rutherglen, North Lanark, South Lanark, Govan and Partick each returning one member. The burghs are Glasgow, Lanark, and Rutherglen; the municipal and police burghs Airdrie, Biggar, Coatbridge, Glasgow, Govan, Hamilton, Partick, Rutherglen and Wishaw. Glasgow returns seven members to Parliament; Airdrie, Hamilton and Lanark belong to the Falkirk group and Rutherglen to the Kilmarnock group of parliamentary burghs. Lanarkshire has two members in the House of Commons, one for Lanark and South Lanark, Govan and Partick each returning one member. This is the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, dairying, cooking, laundry work, nursery and poultry-keeping, in paying fees and railway fares and providing bursaries for technical students, and in subsidizing agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education. The county council is the body that licenses the county council, and Coatbridge and Airdrie themselves subsidize agriculture, chemistry, mining, and technical education.
several exciting episodes. Many of Wallace’s daring deeds were performed in the county, Queen Mary met her fate at Lancaster (1528) and the Covenanters received their support from the people, defeating Cleverton at Drumclog (1679), but suffering defeat themselves at Bothwell Brig (1679).

See W. Hamilton, *Description of the Sheriffsdoms of Lanark and Renfrew*, Mainland Club (1831); C. V. Irving and A. Murray, *The Upper Ward of Lanarkshire* (Glasgow, 1884); *The Clydevale Book Bonus* (1808); W. A. Cowan, *History of Lanark* (Lanark, 1871); *Extracts from the Records of the Borough of Lanark* (Glasgow, 1892).

**LANCAHIRE**, a north-western county of England, bounded N.E. by Westmorland, E. by Yorkshire, S. by Cheshire, W. by the Irish Sea and N.W. by Cumberland. The area is 1880-2 sq. m., the county being the sixth in size in England. The coast is generally flat, and broken by great inlets, with wide expanses of sandy foreshore at low tide. The chief inlets, from N. to S., are—the estuary of the river Duddon, which, with the river itself, separates the county from Cumberland; Morecambe Bay; and the estuaries of the Ribble and the Mersey. Morecambe Bay receives the rivers Crake and Leven in a common estuary, and the Kent from Westmorland; while the Lune and the Wyre discharge into Lancaster Bay, which is only partially separated from Morecambe Bay by the promontory of Red Nab. Morecambe Bay also detaches from the rest of the county of Furness (q.v.), extending to the westward and northward, and sloping off in coast the island of Walney 8 m. in length, and several small isles within the strait between Walney and the mainland. The principal seaside resorts and watering-places, from S. to N., are Southport, Lytham, St Anne’s-on-the-Sea, Blackpool, Fleetwood and Morecambe; while at the head of Morecambe Bay are several pleasant villages frequented by visitors, such as Arnside and Grange. Of the rivers the Mersey (q.v.), separating the county from Cheshire, is the principal, and receives from Lancashire the Irwell, Sankey and other small streams. The Ribble, which rises in the mountains of the West Riding of Yorkshire, forms for a few miles the boundary with that county, and then flows S.W. to Preston, receiving the Hodder from the N. and the Calder and Darwen from the S. Lancashire has a share in two of the English districts most famous for their scenery, but does not include the finest part of either. Furness, entirely hilly except for a narrow coastal tract, extends N. to include the southern part of the Lake District (q.v.) it contains Coniston Water, Ullswater and Windermere, and is bounded on the south by the Yorkshire Dales, while the western counties of Lancashire are hilly mountainous districts, separated by the Leven and Crake, with some smaller lakes and such mountains as the Old Man and Wetherlam. Another elevated district, forming part of a mountainous chain stretching from the Scottish border, covered by the name of Pennine uplands in its broader application, runs along the whole eastern boundary of the main portion of the county, and to the south of the Ribble occupies more than half the area, stretching west nearly to Liverpool. The moorlands in the southern district are generally bleak and covered with heather. Towards the north the scenery is frequently beautiful, the green rounded elevated ridges being separated by pleasant cultivated valleys variegated by woods and watered by rivers. One of the summits of the range within Lancashire attains an elevation of 2000 ft., the highest being Blackstone Edge (1393 ft.), Pendle Hill (1831 ft.) and Boulsworth Hill (1700 ft.).

Along the sea-coast from the Mersey to Lancaster there is a continuous plain formerly occupied by peat moors, many of which have been reclaimed. The largest is Chat Moss between Liverpool and Manchester. In some instances these mosses have exhibited the phenomenon of a moving bog. A large district in the north belonging to the duchy of Lancaster was at one time occupied by forests, but these have wholly disappeared, though their existence is recalled in nomenclature, as in the Forest of Rossendale, near the Yorkshire boundary somewhat south of the centre.

**Geology.**—The greater part of Lancashire, the central and eastern portions, is occupied by Carboniferous rocks; a broad belt of Trassic strata fringes the west and south; while most of the detached northern portion is made up of Silurian and Ordovician formations. The Carboniferous system includes the great coal-field in which are gathered all the principal manufacturing towns, Colne, Burnley, Blackburn, Chorley, Wigan, Bolton, Preston, Oldham, Rochdale and Manchester. In the centre of the coal-field is an elevated moorland tract formed of the shales and of the Millstone Grit series. Part of the small coal-field of Ingleton also lies within the county. The chief coal-seams are respectively barren in which black and white shales predominate, with a broad tract of limestone and shales which are well exposed in the quarries at Chorley and at Longridge, Chipping, Whalley and Downham. The Lancashire coal-field extends from Arnside to Ulverston, through Garstang, Preston, Ormskirk, Liverpool, Warrington and Salford; and Keuper marls, which underlie the surface between the Bunter outcrop and the sea. On the coast there is a considerable development of blown sand dunes, especially near the mouth of the Ribble, and between the Walney Island and the Isle of Man. North of Broughton-in-Furness, Ulverston and Cartmel are the Silurian rocks around Lakes Windermere and Coniston Water, including the Coniston grits and flags and the Brathay flags. These rocks are bounded by the Orlovician Coniston limestone, ranging in the north west and south west, and the volcanic series of Borrowdale. A good deal of the solid geology is obscured in many places by glacial drift, boulder clay and sands.

The available coal supply of Lancashire has been estimated at about 25,000 thousands of tons. In 1852 the amount raised was 8,225,000 tons; in 1899 it was 24,387,475 tons. In the production of coal Lancashire ranks with Yorkshire, but each is about one-third below Durham. There are also raised in large quantities—freeclay, limestone, sand and shale, and a considerable amount of iron ore from the formation of the Preserved Ironstone of the Pennine area, as well as from the Lower Limestone. The red hematitic iron obtained in the Furness district is very valuable, but is liable to decrease. The district also produces a fine blue slate. Metals, excepting iron, are unimportant.

**Industries and Trade.**—South Lancashire is the principal seat of the cotton manufacture in the world, the trade centring upon Manchester, Oldham and the neighbouring densely populated districts. It employs upwards of 400,000 operatives. The worsted, woolen and silk manufactories, flax, hemp and jute industries, though of less importance, employ considerable numbers. Non-textile factories employ about 385,000 hands. The manufacture of machines, appliances, conveyances, tools, &c., are very important, especially in supplying the needs of the cotton and silk districts. Among the cotton goods the principal purpose there is a large branch of industry in the manufacture of bobbins from the wool grown in the northern districts of the county. Of industries principally confined to certain definite centres there may be mentioned—the manufacture of iron and steel at Barrow-in-Furness, a town of remarkably rapid growth since the middle of the 19th century; the great glass works at St Helens; the watch-making works at Preston and the leather works at Warrington. Printing, bleaching and dyeing works, paper and chemical works, india-rubber and tobacco manufactures are among the chief of the other resources of this great industrial region. Besides the port of Liverpool, of worldwide importance, the principal ports are Manchester, brought into communication with the sea by the Manchester Ship Canal opened in 1894, Barrow-in-Furness and Fleetwood, while Preston and Lancaster have docks and a considerable shipping trade by the rivers Lune and Ribble respectively. The sea fisheries, for which Fleetwood and Liverpool are the chief ports, are of considerable value.
Communications.—Apart from the Manchester Ship Canal, canal traffic plays an important part in the industrial region. In 1760 the Sankey canal, 10 m. long, the first canal opened in Britain (apart from very early works), was constructed to carry coal from St Helens to Liverpool. Shortly afterwards the duke of Bridgewater projected the great canal from Manchester across the Irwell to Worsley, completed in 1761 and bearing the name of its originator. The Leeds and Liverpool canal, begun in 1790, connects Liverpool and other important towns with Leeds by a circuitous route of 130 m. The other principal canals are the Rochdale, the Manchester (to Huddersfield) and the Lancaster, connecting Preston and Kendal. A short canal connects Liverpool with Morecambe Bay. A network of railway covers the industrial region. The main line of the London and North Western railway enters the county at Warrington, and runs north through Wigan, Preston, Lancaster and Carnforth. It also serves Liverpool and Manchester, providing the shortest route to each of these cities from London, and shares with the Lancashire and Yorkshire company joint lines to Southport, to Blackpool and to Fleetwood, whence there is regular steamship communication with Belfast. The Lancashire and Yorkshire line serves practically all the important centres as far north as Preston and Fleetwood. All the northern trunk lines from London have services to Manchester and Liverpool. The Cheshire Lines system, worked by a committee of the Great Northern, Great Central and Midland companies, links their systems with the South Lancashire district generally, and maintains lines between Liverpool and Manchester, both these cities with Southport, and numerous branches. Branches of the Midland railway from its main line in Yorkshire serve Lancaster, Morecambe, and Heysham and Carnforth, where connexion is made with the Furness railway to Ulverston, Barrow, Lake Side, Coniston, &c.

Population and Administration.—The area of the ancient county is 1,263,365 acres. Its population in 1801 was 673,486; in 1851, 3,026,762; and in 1901, 4,466,409. The area of the administrative county is 1,166,753 acres. The distribution of the industrial population may be best appreciated by showing the parliamentary divisions, parliamentary, county and municipal boroughs and urban districts as placed among the four divisions of the ancient county. In the case of urban districts the name of the great town to which each is near or adjacent
follows where necessary. The figures show population in 1901.

**NORTHERN DIVISION.**—This embraces almost all the county N. of the Ribble, including Furness, and a small area S. of the Ribble estuary. It is considered as comprising all the divisions for the parliamentary districts, from N. to S.—North Lonsdale, Lancaster, Blackpool, Chorley. Parliamentary, county, and municipal boroughs—Barrow-in-Furness (57,066; one member), Preston (112,669; two members), Morecambe (14,375; two members). Municipal boroughs—Blackburn (14,000), Preston (10,000), Chorley (9,000), Darwen (8,000). Boroughs—Rawtenstall (3,349), Adlington (1,523). Municipal districts—Penwortham (1,756), Broughton (1,166), Buxton (900). Municipal districts—Penwortham (1,756), Broughton (1,166), Buxton (900).

**NORTH-EASTERN DIVISION.**—This lies E. of Preston, and is the smallest of the four. Parliamentary districts—Accrington, Clitheroe, Darwen, Rossendale. Parliamentary, county, and municipal boroughs—Accrington (12,752; two members), Burnley (97,043; one member), Clitheroe (11,144), Colne (23,000), Darwen (38,212), Haslingden (18,453, extending into South-Eastern division), Nelson (32,816). Municipal boroughs—Accrington (43,202), Burnley (22,905), Clitheroe (11,144), Colne (23,000), Darwen (38,212), Haslingden (18,453, extending into South-Eastern division), Nelson (32,816). Municipal districts—Burnley (6,398), Clitheroe (6,000), Colne (6,000), Darwen (6,000), Haslingden (6,000), Nelson (6,000), Rossendale (6,000). Municipal districts—Burnley (6,398), Clitheroe (6,000), Colne (6,000), Darwen (6,000), Haslingden (6,000), Nelson (6,000), Rossendale (6,000).

**SOUTH-WESTERN DIVISION.**—This division represents roughly a quadrilateral with radius of 20 m. drawn from Liverpool. Parliamentary districts—Eccles, Ince, Leigh, Newton, Ormskirk, Southport, Widnes. Parliamentary, county, and municipal borough of Liverpool (68,058; nine members); municipal boroughs—Ansdell, Lytham, Lytham-St. Annes (5,428). Municipal districts—Birkenhead (14,375; one member), Southport (county borough), Widnes (28,580). Parliamentary boroughs—Mount Pleasant (9,566), Leigh (10,001), Southport (county borough), Widnes (28,580). Municipal boroughs—Mount Pleasant (9,566), Leigh (10,001), Southport (county borough), Widnes (28,580). Municipal districts—Birkenhead (14,375; one member), Southport (county borough), Widnes (28,580).

**SOUTH-EASTERN DIVISION.**—This is the same area as the South-Western division, and it constitutes the heart of the manufacturing region. Parliamentary districts—Eccles, Gorton, Heywood, Middleton, Royton. Parliamentary boroughs—Eccleshall (5,543; two members), Radcliffe-with-Farnworth, Stretford, Westhoughton (5,437; two members), also the county and municipal boroughs of Eccles (5,437; one member), Heywood (6,542; one member), Stretford (12,355; one member), and Westhoughton (14,377; two members). Municipal boroughs—Eccleshall (5,543; two members), Radcliffe-with-Farnworth (5,437; one member), Stretford (12,355; one member), Westhoughton (14,377; two members). Municipal boroughs—Eccleshall (5,543; two members), Radcliffe-with-Farnworth (5,437; one member), Stretford (12,355; one member), Westhoughton (14,377; two members).

**LANCASHIRE.**—One of the counties palatine. It is attached to the duchy of Lancaster, a crown office, and retains the chancery court for the county palatine. The chancery of the duchy of Lancaster was once a court of appeal for the chancery of the county palatine, but now, after its jurisdiction in regard to the estates of the duchy is merely nominal. The chancery of the county palatine has concurrent jurisdiction with the High Court of Chancery in all matters of equity within the county palatine, and independent jurisdiction in regard to a variety of other matters. The county palatine comprises six hundreds.

Lancashire is in the northern circuit, and assizes are held at Lancaster for the north, and at Liverpool and Manchester for the south. There is one court of quarter sessions, and the county is divided into 14 districts. The boroughs of Blackburn, Bolton, Burnley, Liverpool, Manchester, Morecambe, Wigan, and Salford and Wigan have separate commissions of the peace and courts of quarter sessions; and those of Accrington, Ashton-under-Lyne, Barrow-in-Furness, Bolton, Bootle, Burton, Chorley, Colne, Darwen, Eccles, Heywood, Lancashire, Middleton, Moseley, Preston, Rochdale, St Helens, Southport and Warrington have separate commissions of the peace only. There are 430 civil parishes. Lancashire is mainly in the diocese of Manchester, but parts are in those of Liverpool, Carlisle, Ripon, Chester and Wakefield. There are 787 ecclesiastical parishes or districts wholly or in part within the county.

Manchester and Liverpool are each seats of a university, and of other important educational institutions. Within the borough of the county there are many denominational colleges, and near the large boroughs is the famous Roman Catholic college of Stonyhurst. There is a day school for boys at each of the two universities, and also schoolmasters and schoolmistresses in connexion with University College, Liverpool, and a day training college for both. At Edgbaston, Liverpool, there is a residential training college for schoolmasters and schoolmistresses, and at Warrington a residential training college (Chester, Manchester and Liverpool diocesan) for schoolmistresses.

**History.**—The district afterwards known as Lancashire was formed out of the departure of the Romans for many years apparently little better than a waste. It was not until the victory of Aethelfrith, king of Deira, near Chester in 613 cut off the Britons of Wales from those of Lancashire and Cumberland that even Lancashire south of the Ribble was conquered. The part north of the Ribble was not absorbed in the Northumbrian kingdom till the reign of Egfrith (670–683). Of the details of this long struggle we know nothing, but to the stubborn resistance made by the British leaders are due the legends of Arthur; and of the twelve great battles he is supposed to have fought against the English, four are recorded, though probably erroneously, said to have taken place on the river Douglas near Wigan. In the long struggle for supremacy between Mercia and Northumbria, the country between the Mersey and Ribble was sometimes under one, sometimes under the other kingdom. During the 10th century Lancashire was constantly invaded by the Danes, and after the peace of Wedmore (878) it was included in the Danish kingdom of Northumbria. The *A.S. Chronicle* records the reconquest of the district between the Ribble and Mersey in 933 by the English king, when it appears to have been severed from the kingdom of Northumbria and united to Mercia, but the districts north of the Ribble now comprised in the county belonged to Northumbria until its incorporation with the kingdom of England. The name on the Lancashire coast ending in *by*, such as Crosby, Formby, Roby, Kirkby, Derby, show where the Danish settlements were thickest. William the Conqueror gave the lands between the Ribble and Mersey, and Amounderness to Roger de Poictou, but at the time of Domesday Book these had passed out of his hand and belonged to the king.

The name Lancashire does not appear in Domesday; but the lands between the Ribble and Mersey were included in Cheshire and those north of the Ribble in Yorkshire. Roger de Poictou soon regained his lands, and if Rufus added to his possessions the rest of Lonsdale south of the Sands, of which he already held a part, and as he had the Furness fells as well, he owned all that is now known as Lancashire. In 1092 he finally forfeited all his lands, which Henry I. held till, in 1118, he created the honour of Lancaster by incorporating with Roger's forfeited
LANCashire

... certain escheated manors in the counties of Nottingham, Derby and Lincoln, and certain royal manors, and bestowed it upon his nephew Stephen, afterwards king. During Stephen's reign the history of the nobility presents certain difficulties, for David of Scotland held the lands north of the Ribble for a time, and in 1147 the earl of Chester held the district between the Ribble and Mersey. Henry II. gave the whole honour to William, Stephen's son, but in 1164 it came again into the king's hands until 1189, when Richard I. granted it to his brother John. In 1194, owing to John's rebellion, it was confiscated and the honour remained with the crown till 1267. In 1229, however, all the crown demesne between the Ribble and Mersey was granted to Ranulf, earl of Chester, and on his death in 1232 came to William Ferrers, earl of Derby, in right of his wife Agnes, sister and co-heir of Ranulf. The Ferrers held it till 1266, when it was confiscated owing to the earl's rebellion. In 1267 Henry III. granted the honour and county and all the royal demesne therein to his son Edmund, who was created earl of Lancaster. His son, Earl Thomas, married the heiress of Henry de Lacy, earl of Lincoln, and thus obtained the great estates belonging to the de Lacy's in Lancashire. On the death of Henry, the first duke of Lancaster, in 1361, the estates, title and honour fell to John of Gaunt in right of his wife Blanche, the duke's elder daughter, and by the accession of Henry IV., John of Gaunt's only son, to the throne, the duchy and honour became merged in the crown.

The county of Lancaster is first mentioned in 1169 as contributing 100 marks to the Royal Exchequer for defaults and fines. The creation of the honour decided the boundaries, throwing it into Furness and Cartmel, which geographically belong to Westmorland; Lonsdale and Amounderness, which in Domesday had been surveyed under Yorkshire; and the land between the Ribble and Mersey. In Domesday this district south of the Ribble was divided into the six hundreds of West Derby, Newton, Warrington, Blackburn, Salford and Leyland, but before Henry II.'s reign the hundreds of Warrington and Newton were absorbed in that of West Derby. Neither Amounderness nor Lonsdale was called a hundred in Domesday, but soon after that time the former was treated as a hundred. Ecclesiastically the whole of the county originally belonged to the diocese of York, but after the reconquest of the district between the Ribble and Mersey in 923 this part was placed under the bishop of Lichfield in the archdeaconry of Chester, which was subdivided into the rural deaneries of Manchester, Warrington and Leyland. Up to 1541 the district north of the Ribble belonged to the archdeaconry of Richmond in the diocese of York, and was subdivided into the rural deaneries of Amounderness, Lonsdale and Kendal. In 1543 the diocese of Chester was created including all Lancashire, which was divided into two archdeaconies: Chester, comprising the rural deaneries of Manchester, Warrington and Blackburn, and Richmond, comprising the deaneries of Amounderness, Furness, Lonsdale and Kendal. In 1847 the diocese of Manchester was created, which included all Lancashire except parts of West Derby, which still belonged to the diocese of Chester, and Furness and Cartmel, which were added to Carlisle in 1856. In 1878 by the creation of the diocese of Liverpool the south-eastern part of the county was subtracted from the Manchester diocese.

No shire court was ever held for the county, but as a duchy and county palatine it has its own special courts. It may have enjoyed palatine jurisdiction under Earl Morcar before the Conquest, but these privileges, if ever exercised, remained in abeyance till 1531, when Henry, duke of Lancaster, received power by way of the Duchy of Lancaster writs therefrom under his own seal, as well touching pleas of the crown as any other relating to the common laws, and to have all Jura Regalia belonging to a county palatine. In 1357 the county was erected into a palatinate for John of Gaunt's life, and in 1396 these rights of jurisdiction were extended and settled in perpetuity on the dukes of Lancaster. The county palatine courts consist of a chancery which dates back at least to 1376, a court of common pleas, the jurisdiction of which was transferred in 1873 by the Judicature Act to the high court of justice, and a court of criminal jurisdiction which in no way differs from the king's ordinary court. In 1107 the duchy court of Lancaster was created, in which all questions of revenue and dignities affecting the duchy possessions are settled. The chancery of the duchy has been for years practically obsolete. The duchy and county palatine each has its own seal. The office of chancellor of the duchy and county palatine dates back to 1531.

Lancashire is famed for the number of old and important county families living within its borders. The most intimately connected with the history of the county is the family of the earls of Lathom, who with the de Lacy's were the chief great family at Knowsley Hall. Sir John Stanley early in the 15th century married the heiress of Lathom and thus obtained possession of Lathom and Knowsley. In 1456 the head of the family was created a peer by the title of Baron Stanley and in 1485 raised to the cardinal of Derby. The Molyneuxes of Sephton and Croxeth are probably descended from William de Molynes, who came to England with William the Conqueror, and is on the roll of Battle Abbey. Roger de Poictou gave him the manor of Sephton, and Richard de Molyneux who held the estate under Henry II. is undoubtedly an ancestor of the family. In 1628 Sir Richard Molyneux was advanced to the peerage of Ireland by the title of Viscount Molyneux, and in 1771 Charles, Lord Stanley, became 1st Viscount Stanley. The latter was created a peer of the realm in 1780, and his son, Henry, 2nd Viscount Stanley, was created a duke of Buckingham and Chandos, and in 1782 was ennobled as Baron Stanhope, succeeded by his son, Sir Philip Stanhope, who in 1788 was created 3rd Duke of Buckingham and Chandos, and in 1801 was made a Duke of Buckingham. His son, the present Duke of Buckingham and Chandos, is the 4th Duke of Buckingham and Chandos. He is the son of Henry, 3rd Duke of Buckingham and Chandos, who was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. He was created a peer of the realm by the title of Viscount Lathom, and in 1812 was created 2nd Duke of Buckingham and Chandos. LANCASHIRE

advanced through Lancaster, Preston and chorley on his southward march, and lord derby after gathering forces was on his way to meet him when he was defeated at wigan. In 1658, after cromwell's death, a royalist rebellion was raised in which lancashire took a prominent part, but it was quickly suppressed. During the rebellion of 1715 manchester was the chief centre of roman catholic and high church torism. On the 7th of november the scottish army entered manchester, where the pretender was proclaimed king, and advanced to preston, at which place a considerable body of roman catholics joined it. the rebels remained at preston a few days, apparently unaware of the advance of the government troops, until general wills from manchester and general carpenter from lancaster surrounded the town, and on the 13th of november the town and the rebel garrison surrendered. Several of the rebels were hanged at preston, wigan, lancaster and other places. in 1745 prince charles edward passed through the county and was joined by about 200 adherents, called the manchester regiment and placed under the command of colonel townley, who was afterwards executed.

the first industry established in lancashire was that of wool, and with the founding of furness abbey in 1172 wool farming on a large scale began here, but the bulk of the wool grown was exported, not worked up in england. in 1282, however, there was a mill for fulling or bleaching wool in manchester, and by the middle of the 16th century there was quite a flourishing trade in worsted goods. in an act of 1552 manchester “rugs and frizes” are specially mentioned, and in 1566 another act regulated the fees of the aulnager who was to have his deputies at manchester, rochdale, bolton, blackburn and bury; the duty of the aulnagers was to prevent “cottons frizes and rugs” from being sold unsealed, but it must be noted that by cottons is not meant what we now understand by the word, but woolen goods. the 17th century saw the birth of the class of clothiers, who purchased the wool in large quantities and afterwards made it up into cloth in their houses and returned it to the employers. the earliest mention of the manufacture of real cotton goods is in 1641, when manchester made fustians, vermillos and dimities, but the industry did not develop to any extent until after the invention of the fly shuttle by john kay in 1733, of the spinning jenny by james hargreaves in 1765, of the water frame throttle by richard arkwright of bolton in 1769, and of the mule by samuel crompton of hall-in-the-wood near bolton in 1779. so rapid was the development of the cotton manufacture that in 1787 there were over forty cotton mills in lancashire, all worked by water power. in 1789, however, steam was applied to the industry in manchester, and in 1790 in bolton a cotton mill was worked by steam. the increase in the import of raw cotton from 3,870,000 lb in 1769 to 1,083,600,000 in 1860 shows the growth of the industry. the rapid growth was accompanied with intermittent periods of depression, which in 1819 in particular led to the formation of various political societies and to the blanketmakers’ meeting and the peterloo massacre. during the american civil war the five years’ cotton famine caused untold misery in the county, but public and private relief mitigated the evils, and one good result was the introduction of machinery capable of dealing with the shorter staple of indian cotton, thus rendering the trade less dependent for its supplies on america. during the 18th century the only town where maritime trade increased was liverpool, where in the last decade about 4500 ships arrived annually of a tonnage about one-fifth of that of the london shipping. the prosperity of liverpool was closely bound up with the slave trade, and about one-fourth of its ships were employed in this business. with the increase of trade the means of communication improved. in 1758 the duke of bridgewater began the bridgewater canal from worsley to salford and across the irwell to manchester, and before the end of the century the county was intersected by canals. in 1830 the first railway in england was opened between manchester and liverpool, and other railways rapidly followed.
The first recorded instance of parliamentary representation in Lancashire was in 1295, when two knights were returned for the county and two burgesses each for the boroughs of Lancaster, Preston, Wigan and Liverpool. The return added to this return "The right of free men of the city and borough of Lancaster, in 1327 and 1392. The representatives, however, excused one after another from representative representation, which was felt as a burden owing to the compulsory payment of the members' wages. Lancaster ceased to send members in 1367 and 1371, though it renewed its privileges in 1359; from 1359 to 1375 there are no parliamentary returns, but from 1347 to 1367 Lancaster continued to return two members. Preston similarly was excused after 1331, after making eleven returns, but in 1359 and from 1367 onwards returned two members. Wigan and Liverpool sent members in 1259 and 1307, but not again till 1547. To the writ issued in 1362 the sheriff in his return says: "There is not any City or Borough in this County from which citizens or burgesses, or any other person, is to come to parliament." In 1359 Clitheroe and Newton-le-Willows first sent two members. Thus in all Lancashire returned fourteen members, and, with a brief exception during the Commonwealth, this continued to be the parliamentary representation till 1832. By the Reform Act of 1832 Lancashire was assigned four members, two for the northern and two for the southern division. Lancaster, Preston, Wigan and Liverpool continued to send two members, Clitheroe returned one and Newton was disfranchised. The following new boroughs were created: Manchester, Bolton, Blackburn, Oldham, returning two members each; Ashton-under-Lyne, Bury, Rochdale, Salford and Warrington, one each. In 1861 a third member was given to Southport. In 1867 the county was divided into six constituencies, to each of which four members were assigned; since 1885 the county returns twenty-three members. The boroughs returned from 1867 to 1885 twenty-five members, and since 1885 thirty-four. Among the finest and most extensive ecclesiastical ruins in England is the Whalley abbey, first founded at Stanlawe in Cheshire in 1178, and returned in 1259, belonged to the same order. There was a priory of Black Canons at the priory of Upholland, founded of the order of Canons Regular, in 1188. A convent of Augustinian friars was founded at Cartmel dating from Henry II's reign, and one at Lancaster. A convent of Cistercian monks was founded at Cartmel, and one at Warrington about 1280. There are some remains of the Benedictine priory of Fulwood, and of a nunnery at Culcheth. There are also remains of the priory of St. Peter's at Knowsley; it was founded in 1318, and the same order had a priory at Lancaster founded in 1004, a cell at Lytham, of the order of Richard I., and a priory at Penwortham, founded shortly after the Conquest. There was a Dominican house at Lancaster in 1190 from a hospital founded in the reign of Henry II., of which the chapter-house remains. At Keswick, near Manchester, there was a cell of Cistercian monks founded in the reign of John, while at Lancaster there were convents of Dominicans and Franciscans, and at Preston a priory of Grey Friars built by Edmund, Earl of Lancaster, son of Henry III.

Besides the churches mentioned under several counties, the following are those of Aldingham, Norman era; Aughton, Cartmel priory church (see Furness); Hawskhead, Heysham, Norman with traces of earlier date; Hoole, Huyton, Kirkby, rebuilt, with very ancient font; Kirkby Ireleth, late Saxon church; Kirkby Lonsdale, Anglo-Saxon; Lonsdale, Perpendicular, with stained-glass windows; Middleton, rebuilt in 1524, but containing part of the Norman church and several monuments; Ormskirk, Perpendicular with traces of Norman, having two towers, one of which is detached and surmounted by a spire; Overton, with Norman doorway; Radcliffe, Norman; Selton, Perpendicular, with fine brass and recumbent figures of the Molyneux family, also a screen exquisitely carved; St. Helens, near Warrington, Norman arch and old monuments; St. Helens, Perpendicular; Upholland priory church, Early English, with low massy tower; Ulverston, Norman, with embattled tower and several old monuments; Walton-on-the-Hill, anciently the parish church of a large district, dedicated to St. Dunstan, with both old and new abbey church, Decorated and Perpendicular, with Runcie stone monuments.

The principal old castles are those of Lancaster, Dalton, a small ruin, situated on the site of an ancient building; two towers of Glaston castle, built by the lords of Aldingham in the 14th century; the ruins of Greenhalgh castle, built by the first Earl of Derby, and demolished after a siege by order of parliament in 1649. the ruins of Furness, once the residence of the Bishops of Carlisle, are still occupied by the Bishop. These were erected in the reign of Edward III., now most dilapidated. There are many old timber houses and mansions of interest, as well as numerous other ancient buildings.

LANCASTER, HOUSE OF.
The name House of Lancaster is commonly used to designate the line of English kings immediately descended from John of Gaunt, the fourth son of Edward III. But the history of the family and of the title goes back to the reign of Henry III., who created his second son, Edmund, Earl of Lancaster in 1267. This Edmund received in his own day the surname of Crouchback, not, as was afterwards supposed, from a personal deformity, but from having worn a cross upon his back in token of a crusading vow. He is not a person of much importance in history except in relation to a strange theory raised in a later age about his birth, which we shall notice presently. His son Thomas, who inherited the title, took the lead among the nobles of Edward II.'s time in opposition to Piers Gaveston and the Despensers, and was beheaded for treason at Pontefract. At the commencement of the following reign his attainder was reversed and his brother Henry restored to the earldom; and Henry being appointed guardian to the young King Edward III., assisted him to throw off the yoke of Mortimer. On this Henry's death in 1345 he was succeeded by a son of the same name, sometimes known as Henry Tort-Coi or Wrynecote, a very valiant commander in the French wars, whom the king advanced to the dignity of a duke. Only one duke had been created in England before, and that was fourteen years previously, when the king's son Edward, the Black Prince, was made duke of Cornwall. This Henry Wrynecote died in 1361 without heir male. His second daughter, Blanche, became the wife of John of Gaunt, who thus succeeded to the duke's inheritance in her right; and on the 13th of November 1362, when King Edward attained the age of fifty, John was created duke of Lancaster, his elder brother, Lionel, being at the same time created duke of Clarence. It was from these two dukes that the rival houses of Lancaster and York derived their respective claims to the crown. As Clarence was King Edward's third son, while John of Gaunt was his fourth, in ordinary course of failure of the elder line, Clarence should have taken precedence of that of Lancaster in the succession. But the rights of Clarence were conveyed in the first instance to an only daughter, and the ambition and policy of the house of Lancaster, profiting by advantageous circumstances, enabled them not only to gain possession of the throne but to maintain themselves in it for three generations before they were dispossessed by the representatives of the elder brother.

As for John of Gaunt himself, it can hardly be said that this sort of politic wisdom was very conspicuous in him. His ambition was generally more manifest than his discretion; but fortune favoured his ambition, even as to himself, somewhat beyond expectation, and still more in his posterity. Before the death of his father he had become the greatest subject in England, his three elder brothers having all died before him. He had even added by marriage the titles of king of Castile, having married, after his first wife's death, the daughter of Peter the Cruel. The title, however, was an empty one, the throne of Castile being actually in the possession of Henry of Trastamara, whom the English had vainly endeavoured to set aside. His military and naval enterprises were for the most part disastrous failures, and in England he was exceedingly unpopular. Nevertheless, during the later years of his father's reign the weakness of the king and the declining health of the Black Prince threw the government very much into his hands. He even aimed, or was suspected of aiming, at the succession to the crown; but in this hope he was disappointed by the action of the Good Parliament a year before Edward's death, in which it was settled that Richard the son of the Black Prince should be king after his grandfather. Nevertheless the suspicion with which he was regarded was not altogether quieted when Richard came to the throne, a boy in the eleventh year of his age. The duke himself complained in parliament in the way he was spoken of out of doors, and at the outbreak of Wat Tyler's insurrection the peasants stopped pilgrims on the road to Canterbury and made them swear never to accept a king of the name of John. On gaining possession of London they burnt his magnificent palace of the Savoy. Richard found a convenient way to get rid of John of Gaunt by sending him to Castile to make good his barren title, and on this expedition he was away three years. He succeeded so far as to make a treaty with his rival, King John, son of Henry of Trastamara, for the succession, by virtue
of which his daughter Catherine became the wife of Henry III. of Castile some years later. After his return the king seems to have regarded him with greater favour, created him duke of Aquitaine, and employed him in repeated embassies to France, which at length resulted in a treaty of peace, and Richard's marriage to the French king's daughter.

Another marked incident of his public life was the support which he gave on one occasion to the Reformer Wycliffe. How far this was due to religious and how far to political considerations may be a question; but not only John of Gaunt but his immediate descendants, the three kings of the house of Lancaster, all took deep interest in the religious movements of the times. A reaction against Lollardy, however, had already begun in the days of Henry IV., and both he and his son felt obliged to disown opinions which were believed to be politically and theologically dangerous.

Accusations had been made against John of Gaunt more than once during the earlier part of Richard II.'s reign of entertaining designs to supplant his nephew on the throne. But these Richard never seems to have wholly credited, and during his three years' absence his younger brother, Thomas of Woodstock, duke of Gloucester, showed himself a far more dangerous intriguer. Five confederate lords with Gloucester at their head took up arms against the king's favourite ministers, and the Wonderful Parliament put to death without remorse almost every agent of his former administration who had not fled the country. Gloucester even contemplated the dethronement of the king, but found that in this matter he could not rely on the support of his associates, one of whom was Henry, earl of Derby, the duke of Lancaster's son. Richard soon afterwards, by declaring himself of age, shook off his uncle's control, and within ten years the acts of the Wonderful Parliament were reversed by a parliament no less arbitrary. Gloucester and several of his allies were then brought to account; but the earl of Derby and Thomas Mowbray, earl of Nottingham, were taken into favour as having opposed the more violent proceedings of their associates. As to show his entire confidence in these noblemen, the king created the former duke of Hereford and the latter duke of Norfolk. But within three months from this time the one duke accused the other of treason, and the truth of the charge, after much consideration, was referred to trial by battle according to the laws of chivalry. But when the combat was about to commence it was interrupted by the king, who, to preserve the peace of the kingdom, decreed by his own mere authority that the duke of Hereford should be banished for ten years—a term immediately afterwards reduced to five—and the duke of Norfolk for life.

This article was the first instance by both parties, and Norfolk never returned. But Henry, duke of Hereford, whose milder sentence was doubtless owing to the fact that he was the popular favourite, came back within a year, having been furnished with a very fair pretext for doing so by a new act of injustice on the part of Richard. His father, John of Gaunt, had died in the interval, and the king, troubled with a rebellion in Ireland, and sorely in want of money, had seized the duchy of Lancaster as forfeited property. Henry at once sailed for England, and landing in Yorkshire while King Richard was in Ireland, gave out that he came only to recover his inheritance. He at once received the support of the northern lords, and as he marched southwards the whole kingdom was soon practically at his command. Richard, by the time he had recrossed the channel to Wales, discovered that his cause was lost. He was conveyed from Chester to London, and forced to execute a deed by which he resigned his crown. This was recited in parliament, and he was formally deposed. The duke of Lancaster then claimed the kingdom as due to himself by virtue of his descent from Henry III.

The claim which he put forward involved, to all appearance, a strange falsification of history, for it seemed to rest upon the supposition that Edmund Crouchback, and not Edward I., was the eldest son of Henry III. A story had gone about, even in the days of John of Gaunt, who, if we may trust the rhymer John Hardying (Chronicle, pp. 290, 291), had got it inserted in chronicles deposited in various monasteries, that this Edmund, surnamed Crouchback, was really bump-backed, and that he was set aside in favour of his younger brother Edward on account of his deformity. No chronicle, however, is known to exist which actually states that Edmund Crouchback was thus set aside; and in point of fact he had no deformity at all, while Edward was six years his senior. Hardying's testimony is, moreover, suspicious as reflecting the prejudices of the Percys after they had turned against Henry IV., for Hardying himself expressly says that the earl of Northumberland was the source of his information (see note, p. 353 of his Chronicle). But a statement in the continuation of the chronicle called the Eulogium (vol. ii. pp. 369, 370) corroborates Hardying to some extent; for we are told that John of Gaunt had once desired in parliament that his son should be recognized on this flimsy plea as heir to the crown; and when Roger Mortimer, earl of March, denied the story and insisted on his own claim as descended from Lionel, duke of Clarence, Richard imposed silence on both parties. However this may be, it is certain that this story, though not directly asserted to be true, was indirectly pointed at by Henry when he put forward his claim, and no one was then bold enough to challenge it.

This was partly due, no doubt, to the fact that the true lineal heir after Richard was then a child, Edmund, who had just succeeded his father as earl of March. Another circumstance was unfavourable to the house of Mortimer—that it derived its title through a woman. No case precisely similar had as yet arisen, and, notwithstanding the precedent of Henry II., it might be doubted whether succession through a female was favoured by the constitution. If not, Henry could say with truth that he was the direct heir of his grandfather, Edward III. If, on the other hand, succession through females was valid, he could trace his descent through his mother from Henry III. by a very illustrious line of ancestors. And, in the words by which he formally made his claim, he ventured to say no more than that he was descended from the king last mentioned "by right line of the blood." In what particular way that "right line" was to be traced he did not venture to indicate.

A brief epitome of the reigns of the three successive kings belonging to the house of Lancaster (Henry IV., V. and VI.) will be found elsewhere. With the death of Henry VI. the direct male line of John of Gaunt became extinct. But by his daughters he became the ancestor of more than one line of foreign kings, while his descendants by his third wife, Catherine Swynford, conveyed the crown of England to the house of Tudor. It is true that his children by this lady were born before he married opposing the king, Henry. It is more likely that he, Henry, sought to secure the throne for his son by marriage, partly to strengthen his position, and partly to secure the crown of England to his own house. When he was denied this by his brother, Richard, he was forced to marry another woman, and to make a new alliance with the Percys. He attempted to secure the crown of Scotland for his son by the marriage of his daughter to the king of Scotland, but the marriage was not consummated, and the alliance thus made was dissolved.

The claim of the earl of Lancaster to the crown was at first received with favour by the parliament of 1398, but was afterwards disallowed by the parliament of 1399, and all his possessions were sequestered by the king. But the earl was able to secure the throne of Scotland, and to hold it for many years. He was also able to secure the crown of England, and to hold it for many years. But he was not able to secure the titles and estates of Lancaster to which he was heir, and he showed openly that his sympathies were with his dead brother. When Queen Isabella took up arms against her husband in 1326 she was joined at once by the earl, who took a leading part in the proceedings against the king and his favourites, the Despensers, being Edward's casel at Kenilworth castle. Edward III. being now on the throne, Leicester secured the earldom of Lancaster and his brother's lands, becoming also steward of England; he knighted the young king and was the foremost...

LANCASTER, Sir J.—LANCASTER, Duke of

member of the council, but he was soon at variance with Isabella and her paramour, Roger Mortimer, and was practically deprived of his power. In 1328 his attempt to overthrow Mortimer failed, and he quietly made his peace with the king; a second essay against Mortimer was more successful. About this time Lancaster became blind; he retired from public life and died on the 22nd of September 1345.

His son and successor, Henry, 1st Duke of Lancaster (c. 1300-1361), was a soldier of unusual distinction. Probably from his birthplace in Monmouthshire he was called Henry of Gromont. He fought in the naval fight off Sluys and in the one off Winchelsea in 1350; he led armies into Scotland, Gascony and Normandy, his exploits in Gascony in 1345 and 1346 being especially successful; he served frequently under Edward III. himself; and he may be fairly described as one of the most brilliant and capable of the English warriors during the earlier part of the Hundred Years' War. During a brief respite from the king's service he led a force into Prussia and he was often employed on diplomatic business. In 1354 he was at Avignon negotiating with Pope Innocent VI., who wished to make peace between England and France, and one of his last acts was to assist in arranging the details of the treaty of Brétigny in 1360.

In 1357 he was made earl of Derby; in 1345 he succeeded to his father's earldoms of Lancaster and Leicester; in 1349 he was created earl of Lincoln, and in 1351 he was made duke of Lancaster. He was steward of England and one of the original knights of the order of the garter. He died at Leicester on the 13th of March 1361. He left no sons; one of his daughters, Maud (d. 1362), married William V., count of Holland, a son of the emperor Louis the Bavarian, and the other, Blanche (d. 1360), married Edward III.'s son, John of Gaunt, who obtained his father-in-law's titles and estates.

LANCASTER, Sir James (b. 1351-1368), English navigator and statesman, one of the foremost pioneers of the British trade and empire. In early life he fought and traded in Portugal. On the 10th of April 1591 he started from Plymouth, with Raymond and Foxcroft, on his first great voyage to the East Indies; this fleet of three ships is the earliest of English overseas Indian expeditions. Reaching Table Bay (1st of August 1591), and losing one ship off Cape Correntes on the 12th of September, the squadron rested and repaired at Zanzibar (February 1592), rounded Cape Comorin in May following, and was off the Malay Peninsula in June. Crossing later to Ceylon, the crews insisted on returning home; the voyage back was disastrous; only twenty-five officers and men appeared in England in 1594. Lancaster himself reached Rye on the 24th of May 1594; in the same year he fought against Pernambuco, without much success; but his Indian voyage, like Ralph Fitch's overland explorations and trading, was an important factor in the foundation of the East India Company. In 1600 he was given command of the company's first fleet (which sailed from Torbay towards the end of April 1601); he was also accredited as Queen Elizabeth's special envoy to various Eastern potentates. Going by the Cape of Good Hope (1st of November 1601) Lancaster visited the Nicobars (from the 9th of April 1602), Achin and other parts of Sumatra (from the 5th of June 1602), and Bantam in Java; an alliance was concluded with Achin, a factory established at Bantam and a commercial mission despatched to the Moluccas. The return voyage (20th of February to 11th of September 1603) was speedy and prosperous, and Lancaster (whose success both in trade and in diplomacy had been beyond all expectations) was rewarded with knighthood (October 1603). He continued to be one of the chief directors of the East India Company till his death in May 1618: most of the voyages of the early Stuart time both to India and in search of the North-West passage were undertaken under his advice and direction; Lancaster Sound, on the north-west of Baffin's Bay (in 74° 20' N.), was named by William Baffin after Sir James (July 1616).

See Hakluyt, Principal Navigations, vol. ii. pt. ii. pp. 102-110, vol. iii. pp. 708-715 (1599); Purchas, Pilgrims, vol. i. pt. ii. pp. 147-163; also The Voyages of Sir James Lancaster . . . to the East Indies . . ., ed. Sir Clements Markham, Hakluyt Soc. (1877), Calendars of State Papers, East Indies. The original journals of Lancaster's voyage of 1601-1603 have disappeared, and here we have only Purchas to go on.

LANCASTER, John of Gaunt, Duke of (1340-1399), fourth son of Edward III. and Queen Philippa, was born in March 1340 at Ghent, whence his name. On the 29th of September 1342 he was made Earl of Richmond; as a child he was present at the sea fight with the Spaniards in August 1350, but his first military service was in 1355, when he was knighted. On the 19th of May 1359 he married his cousin Blanche, daughter and ultimately sole heiress of Henry, Duke of Lancaster. In her right he became Earl of Lancaster in 1361, and next year was created Duke. His marriage made him the greatest lord in England, but for some time he took no prominent part in public affairs. In 1366 he joined his eldest brother, Edward the Black Prince, in Aquitaine, and in the year after led a strong contingent to share in the campaign in support of Pedro the Cruel of Castile. With this began the connexion with Spain, which was to have so great an influence on his after-life. John fought in the van at Najera on the 3rd of April 1367, when the English victory restored Pedro to his throne. He returned home at the end of the year. Pedro proved false to his English allies, and was finally overthrown and killed by his rival, Henry of Trastamara, in 1369. The disastrous Spanish enterprise led directly to renewed war between France and England. In August 1369 John had command of an army which invaded northern France without success. In the following year he went again to Aquitaine, and was present with the Black Prince at the sack of Limoges. Edward's health was broken down, and he soon after went home, leaving John as his lieutenant. For a year John maintained the war at his own cost, but whilst in Aquitaine a greater prospect was opened to him. The Duchesses Blanche had died in the autumn of 1369 and now John married Constance (d. 1394), the elder daughter of Pedro the Cruel, and in her right assumed the title of King of Castile and Leon. For sixteen years the pursuit of his kingdom was the chief object of John's ambition. No doubt he hoped to achieve his end, when he commanded the great army which invaded France in 1373. But the French would not give battle, and though John marched from Calais right through Champagne, Burgundy and Auvergne, it was with disastrous results; only a shattered remnant of the host reached Bordeaux.

The Spanish scheme had to wait, and when John got back to England he was soon absorbed in domestic politics. The king was prematurely old, the Black Prince's health was broken. In the face of the unpopularity of his ill-success, was forced into the foremost place. As head of the court party John was called upon to bear the brunt of the attack on the administration made by the Good Parliament in 1376. It was not perhaps altogether just, and John was embittered by reflections on his loyalty. As soon as the parliament was dissolved he had its proceedings reversed, and next year secured a more subservient assembly. There came, however, a new development. The duke's politics were opposed by the chief ecclesiastics, and in resisting them he had made use of Wycliffe. With Wycliffe's religious opinions he had no sympathy. Nevertheless when the bishops arraigned the reformer for heresy John would not abandon him. The conflict over the trial led to a violent quarrel with the Londoners, and a riot in the city during which John was in danger of his life from the angry citizens. The situation was entirely altered by the death of Edward III. on the 21st of June. Though his enemies had accused him of aiming at the throne, John was without any taint of disloyalty. In his nephew's interests he accepted a compromise, disclaimed before parliament the truth of the malicious rumours against him, and was reconciled formally with his opponents. Though he took his proper place in the ceremonies at Richard's coronation, he showed a taciturn moderation by withdrawing for a time from any share in the government. However, in the summer of 1378, he commanded in an attack on St Malo, which through no fault of his failed. To add to this misfortune, during his absence some of his supporters
violated the sanctuary at Westminster. He vindicated himself somewhat bitterly in a parliament at Gloucester, but still avoiding a prominent part in the government, accepted the command on the Scottish border. He was there engaged when his palace of the Savoy in London was burnt during the peasants' revolt in June 1381. Wild reports that even the government had declared him a traitor made him seek refuge in Scotland. Richard had, however, denounced the calumnies, and at once recalled his uncle.

John's self-restraint had strengthened his position, and he began again to think of his Spanish scheme. He urged its undertaking in parliament in 1382, but nearer troubles were more urgent, and John himself was wanted on the Scottish border. There he sought to arrange peace, but against his will was captured and kept for ransom. He created a duke of Bedford, renewed his unpopularity, and the court favourites of Richard II. intrigued against him. They were probably responsible for the allegation, made by a Carmelite, called Latemar, that John was conspiring against his nephew. Though Richard at first believed it, the matter was disposed of by the friar's death. However, the court party soon after concocted a fresh plot for the duke's destruction; John boldly denounced his traducers, and the quarrel was appeased by the intervention of the king's mother. The intrigue still continued, and broke out again during the Scottish campaign in 1385. John was not the man to be forced into treason to his family, but the impossibility of the position at home made his foreign ambitions more feasible.

The victory of John of Portugal over the king of Castile at Aljubarrota, won with English help, offered an opportunity. In July 1386 John left England with a strong force to win his Spanish throne. He landed at Corunna, and during the autumn conquered Galicia. Juan, who had succeeded his father Henry as king of Castile, offered a compromise by marriage. John of Gaunt refused, hoping for greater success with the help of the king of Portugal, who now married the duke's eldest daughter Philippa. In the spring the allies invaded Castile. They could achieve no success, and sickness ruined the English army. The conquests of the previous year were lost, and when Juan renewed his offers, John of Gaunt agreed to surrender his claims to his daughter by Constance of Castile, who was to marry Juan's heir. After some delay the peace was concluded at Bayonne in 1388. The next eighteen months were spent by John as lieutenant of Aquitaine. In 1389 he was married to Catherine of Lancaster, the dowry of which brought him to England. By his absence he had avoided implication in the troubles at home. Richard, still insincere of his own position, welcomed his uncle, and early in the following year marked his favour by creating him duke of Aquitaine. John on his part was glad to support the king's government; during four years he exercised his influence in favour of pacification at home, and abroad was chiefly responsible for the conclusion of a truce with France. Then in 1395 he went to take up the government of his duchy; thanks chiefly to his lavish expenditure his administration was not unsuccessful, but the Gascons had from the first objected to government except by the crown, and secured his recall within less than a year. Almost immediately after his return John married as his third wife Catherine Swynnford; Constance had died in 1394 and the queen had been mistress for many years, and his children by her, who bore the name of Beaufort, were now legitimated. In this and in other matters Richard found it politic to conciliate him. But though John presided at the trial of the earl of Arundel in September 1397, he took no active part in affairs. The exile of his son Henry in 1398 was a blow from which he did not recover. He died on the 3rd of February 1399, and was buried at St Paul's near the high altar.

John was neither a great soldier nor a statesman, but he was a chivalrous knight and loyal to what he believed were the interests of his family. In spite of opportunities and provocations he never lent himself to treason. He deserves credit for his protection of Wycliffe, though he had no sympathy with his religious or political opinions. He was also the patron of Chaucer, whose _Boke of the Duchess_ was a lament for Blanche of Lancaster.

The chief original sources for John's life are Froissart, the maliciously hostile _Chronicon Angliae_ (1328–1388), and the eulogistic _Chronicle of Henry Knighton (both the latter in the Rolls Series). But fuller information is to be found in the excellent biography by S. Armytage-Smith, published in 1904. For his descendants see the table under LANCASTER, HOUSE OF.

(C. L. K.)

LANCASTER, J. (1378–1838), English educationalist, was born in Southwark in 1778, the son of a Chelsea pensioner. He had few opportunities of regular instruction, but he very early showed unusual seriousness and desire for learning. At sixteen he looked forward to the dissenting ministry; but soon after his religious views altered, and he attached himself to the Society of Friends, with which he remained associated for many years, until long afterwards he was disowned by that body. At the age of twenty he began to gather a few poor children under his father's roof, and to give them the rudiments of instruction, without a fee, except in cases in which the parent was willing to pay a trifle. Soon a thousand children were assembled in the Borough Road; and, the attention of the duke of Bedford, Mr Whitbread, and others having been directed to his efforts, he was provided with means for building a schoolroom and supplying needful materials. The main features of his plan were the employment of older scholars as monitors, and an elaborate system of mechanical drill, by means of which these young teachers were made to impart the rudiments of reading, writing and arithmetic to large numbers at the same time. The clerical appliance for teaching was very scanty—few leaftorn out of spelling-books and pasted on boards, some slates and a desk spread with sand, on which the children wrote with their fingers. The order and cheerfulness of the school and the military precision of the children's movements began to attract much public observation at a time when the education of the poor was almost entirely neglected. Lancaster inspired his young monitors with fondness for their work and with pride in the institution of which they formed a part. As these youths became more trustworthy, he found himself at leisure to accept invitations to expound what he called "his system" by lectures in various towns. In this way many new schools were established, and placed under the care of young men whom he had trained.

In a memorable interview with George III., Lancaster was encouraged by the expression of the king's wish that every poor child in his dominions should be taught to read the Bible. Royal patronage brought in its train resources, fame and public responsibility, which proved to be beyond Lancaster's own powers to sustain or control. He was vain, reckless and improvident. In 1808 a few noblemen and gentlemen paid his debts, became his trustees and founded the society at first called the Royal Lancastrian Institution, but afterwards more widely known as the British and Foreign School Society. The trustees soon found that Lancaster was impatient of control, and that his wild impulses and heedless extravagance made it impossible to work with him. He quarrelled with the committee, set up a private school at Tooting, became bankrupt, and in 1818 emigrated to America. There he met at first a warm reception, gave several courses of lectures which were well attended, and wrote to friends at home letters full of temporary success; but the fame was short-lived. The miseries of debt and disappointment were aggravated by sickness, and he settled for a time in the warmer climate of Caracas. He afterwards visited St Thomas and Santa Cruz, and at length returned to New York, the corporation of which city made him a public grant of 500 dollars in pitty for the misfortunes which had by this time reduced him to lamentable poverty. He afterwards visited Canada, where he gave lectures at Montreal, and was encouraged to open a school which enjoyed an ephemeral success, but was soon abandoned. A small annuity provided by his friends in England was his only means of support. He formed a plan for returning home and giving a new impetus to his "system," by which he declared it would be possible "to teach ten thousand children in different schools, not knowing their letters, all to read fluently in three weeks to three months." But these visions were never realized. He was run over by a carriage in the streets of New York on the 24th of October 1838, and died in a few hours.
As one of the two rival inventors of what was called the "monitorial" or "mutual" method of instruction, Lancaster's name was prominent for many years in educational controversy. Dr Andrew Bell, in his Essay on 1179 published an account of his experiments in teaching, and Lancaster in his Mutual Teaching in 1789 frankly acknowledges his debt to Bell for some useful hints. The two worked independently, but Lancaster was the first to apply this method of teaching on a large scale. As an economical experiment his school at Great Whitley, near Reading, was established in 1789. He had one thousand scholars under discipline, and taught them, and wrote and read simple sums at a yearly cost of less than 5s. a head. His treatise on this new method he entitled "Monitorial Instruction" and published in 1796. He went on to devise an apparatus with the system of signals and orders, the function of the monitors, the method of counting and of spelling and the curious devices he adopted for punishing offenders. Bell's educational aims were very different to those of their predecessors. He founded the "National Society for the Education of the Poor in the principles of the Established Church" having been founded, in 1811 for its propaganda; while Lancaster's method was patronized by the Whigs, statesmen, by a few liberal Churchmen and by Nonconformists generally. It was the design of Lancaster and his friends to make national education Christian, but not sectarian,—to cause the Scriptures to be read, explained and recited in the schools without magical or mysterious agencies, to make it not only a source of instruction, but wise to attract the children to any particular church or sect. This principle was at first vehemently denounced as deceitful and mischievous, and as especially hostile to the Established Church. To do this, and to achieve his own ends, he must collect and claim the aid of Bell and Lancaster were urged with more passion and unfairness by their friends than by themselves. Yet neither is entitled to hold a very high place among the world's teachers. Bell was cold, self-seeking and devious, and he aimed at the secret, the genuine and abounding love for children, and some ingenuity in devising plans both for teaching and governing. But he was shiftless, wayward and unmethodical, and incapable of sustained and high-minded general effort. His writings were more numerous and his numbers of hitherto neglected children under discipline, and gave them elementary instruction at a very cheap rate. Moreover, the little monitors were often found to make up in brightness, tractability, and industry what they lacked in discipline, and skill in reading, writing, and computing with surprising success. And one cardinal principle of Bell and Lancaster is of prime importance. They regarded a school, not merely as a place to which individual pupils were taken, but a small community, with a self-contained government, in which the members must look to one another, that the community whose members have much to learn from each other. They sought to place their scholars from the first in helpful mutual relations, and to make them feel the need of common efforts towards the attainment of common ends.

LANCASTER, Thomas, earl of (c. 1277–1322), was the eldest son of Edmund, earl of Lancaster and titular king of Sicily, and a grandson of the English king, Henry III; while he was related to the royal house of France both through his mother, Blanche, a granddaughter of Louis VIII, and his stepfather, the count of Anjou. The death of his father in 1296 left him a minor when Edward I died in 1307. Thomas received his father's earldoms of Lancaster and Leicester in 1298, but did not become prominent in English affairs until after the accession of his cousin, Edward II, in July 1307. Having married Alice (d. 1348), daughter and heiress of Henry Lacy, earl of Lincoln, and added the earldom of Derby to those which he already held, he was marked out both by his wealth and position as the leader of the barons in their resistance to the new king. With his associates he produced the banishment of the royal favourite, Piers Gaveston, in 1308; compelled Edward in 1310 to surrender his power to a committee of "ordinaries," among whom himself was numbered; and took up arms when Gaveston returned to England in January 1312. Lancaster, who had just obtained the earldoms of Lincoln and Salisbury on the death of his father-in-law in 1311, drove the king and his favourite from Newcastle to Scarborough, and was present at the execution of Gaveston in June 1312. After lengthy efforts at mediation, he made his submission and received a full pardon from Edward in October 1313; but he refused to accompany the king on his march into Scotland, which ended at Bannockburn, and took advantage of the English disaster to wrest the control of affairs from the hands of Edward. In 1315 he took command of the forces raised to fight the Scots, and was soon appointed to the "chief place in the council," while his supporters filled the great offices of state, but his rule was as leeele as that of the monarch whom he had superseded. Quarrelling with some of the barons, he neglected both the government and the defence of the kingdom, and in 1317 began a private war with John, Earl Warrenne, who had assisted his cousin's escape from her husband. The capture of Berwick by the Scots, however, in April 1318 led to a second reconciliation with Edward. A formal treaty, made in the following August, having been ratified by parliament, the king and earl opened the siege of Berwick; but there was no cohesion between their troops, and the undertaking was quietly abandoned. On several occasions Lancaster was suspected of intriguing with the Scots, and it is significant that his lands were spared when Robert Bruce ravaged the north of England. He refused to attend the councils or to take any part in the government until 1321, when the Dispensers were banished, and war broke out again between himself and the king. Having conducted some military operations against Lancaster's friends on the Welsh marches, Edward led his troops against Earl, who gradually fell back from Brecon-on-Trent to Pontefract. Continuing his movement, Lancaster reached Boroughbridge, where he was met by another body of royalists under Sir Andrew Harley. After a skirmish he was deserted by his troops, and was obliged to surrender. Taken to his own castle at Pontefract, where the king was, he was condemned to death as a rebel and a traitor, and was beheaded near the town on the 22nd of March 1322. He left no children.

Although a coarse, selfish and violent man, without any of the attributes of a statesman, Lancaster won a great reputation for patriotism; and his memory was long cherished, especially in the north of England, as that of a defender of popular liberties. Over a hundred years after his death miracles were said to have been worked at his tomb at Pontefract; thousands visited his effigy in St Paul's Cathedral, London, and it was even proposed to make him a saint.

LANCASTER, a market town and municipal borough, port, and the county town of Lancashire, England, in the Lancaster parliamentary division, 230 m. N.W. by N. from London by the London & North-Western Railway (Castle Station); served also by a branch of the Midland railway (Green Ayre station). Pop. (1891) 33,256, (1901) 40,329. It lies at the head of the estuary of the river Lune, mainly on its south bank, 7 m. from the sea. The site slopes sharply up to an eminence crowned by the castle and the church of St Mary. Fine views over the rich valley and Morecambe Bay to the west are commanded from the town. St Peter's Church is beautifully attached by Roger de Poctou to his Benefice priory founded at the close of the 11th century. It contains some fine Early English work in the nave arcade, but is of Perpendicular workmanship in general appearance, while the tower dates from 1756. There are some beautiful Decorated oak stalls in the chancel, brought probably from Cockersand or Furness Abbey.

The castle occupies the site of a Roman castrum. The Saxon foundations of a yet older structure remain, and the tower at the south-west corner is supposed to have been erected during the reign of Hadrian. The Dungeon Tower, also supposed to be of Roman origin, was taken down in 1818. The greater part of the old portion of the present structure was built by Roger de Poictou, who utilized some of the Roman towers and the old walls. In 1322 much damage was done to the castle by Robert
Bruce, whose attack it successfully resisted, but it was restored and strengthened by John of Gaunt, who added the greater part of the Gateway Towers as well as a turret on the keep or Lugness Tower, which on that account has been named "John o' Gaunt's Chair." During the Civil War the castle was captured by Cromwell. Shortly after this it was put to public use, and now, largely modernized, contains the assize courts and gaol. Its appearance, with massive buildings surrounding a quadrangle, is picturesque and dignified. Without the walls is a pleasant terrace walk. Other buildings include several handsome modern churches and chapels (notably the Roman Catholic church); the Storey Institute with art gallery, technical and art schools, museum and library, presented to the borough by Sir Thomas Storey in 1887; Palatine Hall, Ripley hospital (an endowed school for the children of residents in Lancaster and the neighbourhood), the asylum, the Royal Lancaster infirmary and an observatory in the Williamson Park. A new town hall, presented by Lord Ashton in 1909, is a handsome classical building from designs of W. E. Mounfield. The Ashton Memorial in Williamson Park, commemorating members of the Ashton family, is a lofty domed structure. The grammar school occupies modern buildings, but its foundation dates from the close of the 15th century, and in its former Jacobean house near the church William Whewell and Sir Richard Owen were educated. A horseshoe inserted in the pavement at Horseshoe Corner in the town, and renewed from time to time, is said to mark the place where a shoe was cast by John of Gaunt's horse. The chief industries are cotton-spinning, cabinet-making, oil cloth-making, railway wagon-building and engineering. Glasson Dock, 5 m. down the Lune, with a graving dock, is accessible to vessels of 100 tons. The Kendal and Lancaster canal reaches the town by an aqueduct over the Lune, which is also crossed by a handsome bridge dated 1788. The town has further connexion by canal with Preston. The corporation consists of a mayor, 8 aldermen and 24 councillors. Area, 3,306 acres.

History.—Lancaster (Lancaster or Lunecastrum) was an important Roman station, and traces of the Roman fortification wall remain. The Danes left few memorials of their occupation, and the Runic Cross found here, once supposed to be Danish, is now conclusively proved to be Anglo-Saxon. At the Conquest, the place, reduced in size and with its Roman castrum almost in ruins, became a possession of Roger de Poictou, who founded or enlarged the present castle on the old site. The town and castle had a somewhat chequered ownership till 1266 they were granted by Henry III. to his son Edmund, first earl of Lancaster, and continued to be a part of the duchy of Lancaster till the present time. A town gathered around the castle, and in 1193 John, earl of Mertoun, afterwards king, granted it a charter, and another in 1199 after his accession. Under these charters the burgesses claimed the right of electing a mayor, of holding a yearly fair at Michaelmas and a weekly market on Saturday. Henry III. in 1226 confirmed the charter of 1199; in 1291 the style of the corporation is first mentioned as Bullius et communis burgi; and Edward III.'s confirmation and extension in 1354 is recorded to the mayor, bailiffs and commonalty. Edward III.'s charter was confirmed by Richard II. (1390), Henry IV. (1400), Henry V. (1422), Henry VII. (1488) and Elizabeth (1563). James I. (1604) and Charles II. (1665 and 1685) ratified, with certain additions, all previous charters, and again in 1819 a similar confirmation was issued. John of Gaunt in 1362 obtained a charter for the exclusive right of holding the sessions of pleas for the county in Lancaster itself, and up to 1873 the duchy appointed a chief justice and a puisne justice for the court of common pleas at Lancaster. In 1322 the Scots burnt the town, the castle alone escaping; the town was rebuilt but removed from its original position on the hill to the slope and foot. Again in 1389, after the battle of Otterburn, it was destroyed by the same enemy. At the outbreak of the Great Rebellion the burgesses sided with the king, and the town and castle were captured in February 1643 by the Parliamentarians. In March 1643 Lord Derby assaulted and took the town with great slaughter, but the castle remained in the hands of the Parliamentarians. In May and June of the same year the castle was again besieged in vain, and in 1648 the Royalists under Sir Thomas Tyldesley once more fruitlessly besieged it. During the rebellion of 1715 the northern rebels occupied Lancaster for two days and several of them were later executed here. During the 1745 rebellion Prince Charles Edward's army passed through the town in its southward march and again in its retreat, but the inhabitants stood firm for the Hanoverians.

Two chartered markets are held weekly on Wednesday and Saturday and three annual fairs in April, July and October. A market guild existed here, which was granted a charter in 1398, and was confirmed by Henry V. (1356), and in 1688 six trade companies were incorporated. The chief manufactures used to be sailcloth, cabinet furniture, candles and cordage. The borough returned two members to parliament from 1295 to 1311 and again from some time in Henry VIII.'s reign before 1529 till 1867, when it was merged in the Lancaster division of north Lancashire. A church existed here, probably on the site of the parish church of St Mary's, in Anglo-Saxon times, but the present church dates from the early 15th century. An act of parliament was passed in 1792 to make the canal from Kendal through Lancaster and Preston, which is carried over the Lune about a mile above Lancaster by a splendid aqueduct.

See FLEURY, Time Honoured Lancaster (1891); E. BAINES, History of Lancaster (1888).

Lancaster, a city and the county-seat of Fairfield county, Ohio, U.S.A., on the Hocking river (non-navigable), about 32 m. S.E. of Columbus. Pop. (1900) 8901, of whom 442 were foreign-born and 212 were negroes; (1910 census) 13,063. Lancaster is served by the Hocking Valley, the Columbus & Southern and the Cincinnati & Muskingum Valley (Pennsylvania Lines) railways, and by the electric line of the Scioto Valley Traction Company, which connects it with Columbus. Near the centre of the city is Mt. Pleasant, which rises nearly 200 ft. above the surrounding plain and about which cluster many Indian legends; with 70 acres of woodland and fields surrounding it, this has been given to the city for a park. On another hill is the county court house. Lancaster has a public library and a children's home; and 6 m. distant is the State Industrial School for Boys. The manufactures include boots and shoes, glass and agricultural implements. The total value of the city's factory product in 1899 was $14,150,410, being an increase of 118.8% over that of 1900. Lancaster is the trade centre of a fertile agricultural region, has good transportation facilities, and is near the Hocking Valley and Sunday Creek Valley coal-fields; its commercial and industrial importance increased greatly, after 1900, through the development of the neighbouring natural gas fields and, after 1907-1908, through the discovery of petroleum near the city. Good sandstone is quarried in the vicinity. The municipality owns and operates its waterworks and natural gas plant. Lancaster was founded in 1800 by Ebenezer Zane (1747-1811), who received a section of land here as part compensation for opening a road, known as "Zane's Trace," from Wheeling, West Virginia, to Limestone (now Maysville), Kentucky. Some of the early settlers were from Lancaster, Pennsylvania, whence the name. Lancaster was incorporated as a village in 1831 and twenty years later became a city of the third class.

Lancaster, a city and the county-seat of Lancaster county, Pennsylvania, U.S.A., on the Conestoga river, 68 m. W. of Philadelphia. Pop. (1900) 47,450, of whom 3402 were foreign-born and 777 were negroes; (1910 census) 47,227. It is served by the Pennsylvania, the Philadelphia & Reading and the Lancaster, Oxford & Southern railways, and by tramways of the Conestoga Traction Company, which had in 1909 a mileage of 152 m. Lancaster has a fine county court house, a soldiers' monument about 43 ft. in height, two fine hospitals, the Thaddeus Stevens Industrial School (for orphans), a children's home, the Mechanics' Library, and the Library of the Lancaster Historical Society. It is the seat of Franklin and Marshall College (Reformed Church), of the affiliated Franklin and Marshall Academy, and of the Theological Seminary of the Reformed Church, conducted in connexion with the college. The college was founded in 1852 by the consolidation of Franklin College, founded at Lancaster in 1785, and Marshall College, founded at Mercersburg in 1836, both of which had
earned a high standing among the educational institutions of Pennsylvania. Franklin College was named in honour of Benjamin Franklin, an early patron; Marshall College was founded by the Reformed Church and was named in honour of John Marshall. The Theological Seminary was opened in 1825 at Carlisle, Pa., and was removed to York, Pa., in 1829, to Mercersburg, Pa., in 1837, and to Lancaster in 1871; in 1831 it was chartered by the Pennsylvania legislature. Among its teachers have been John W. Nevin and Philip Schaff, whose names, and that of the seminary, are associated with the so-called "Mercersburg Theology." At Millersville, 4 m. S.W. of Lancaster, is the Second Pennsylvania State Normal School. At Lancaster are the graves of General John F. Reynolds, who was born here; Thaddeus Stevens, who lived here after 1842; and President James Buchanan, who lived for many years on an estate, " Wheatland," near the city and is buried in the Woodward Hill Cemetery. The city is in a productive tobacco and grain region, and has a large tobacco trade and important manufactures. The value of the city's factory products increased from $13,750,420 in 1900 to $14,647,581 in 1905, or 14.9 per cent. In 1905 the principal products were umbrellas and cases (valued at $2,782,879), cigars and cigarettes ($1,955,971), and foundry and machine-shop products ($1,055,326). Lancaster county has long been one of the richest agricultural counties in the United States, its annual products being valued at about $10,000,000, and in 1900 the value of the tobacco crop was about $3,225,000, and there were 824 manufactories of cigars in the county.

Lancaster was settled about 1717 by English Quakers and Germans, was laid out as a town in 1730, incorporated as a borough in 1742, and chartered as a city in 1785. An important treaty with the Iroquois Indians was negotiated here by the governor of Pennsylvania and by commissioners from Maryland and Virginia in June 1744. Some of General Burgoyne's troops, surrendered at Saratoga, were confined here after the autumn of 1777. Congress sat here on the 27th of September 1777 after being driven from Philadelphia by the British; and subsequently, after the organization of the Federal government, Lancaster was one of the places seriously considered when a national capital was to be chosen. From 1799 to 1812 Lancaster was the capital of Pennsylvania.

LANCE, a form of spear used by cavalry (see SPEAR). The use of the lance, dying away on the decay of chivalry and the introduction of pistol-armed cavalry, was revived by the Polish and Cossack cavalry who fought against Charles XII. and Frederick the Great. It was not until Napoleon's time, however, that lancer regiments appeared in any great numbers on European battlefields. The effective use of the weapon—long before called by Montecuculli the "queen of weapons"—by Napoleon's lancers at Waterloo led to its introduction into the British service, and except for a short period after the South African War, in which it was condemned as an anachronism, it has been shamed, or rather contested, with the sword the present day amongst cavalry arms. In Great Britain and other countries lances are carried by the front rank of cavalry, except light cavalry, regiments, as well as by lancer regiments. In Germany, since 1898, the whole of the cavalry has been armed with the lance. In Russia, on the other hand, line cavalry being, until recently, considered as a sort of mounted infantry or dragoons, the lance was restricted to the Cossacks, and in Austria it enjoys less favour than in Germany. Altogether there are few questions of armament or military detail more freely disputed, in the present day as in the past, than this of sword versus lance.

The lances used in the British service are of two kinds, those with ash and those with bamboo staves. The latter are much preferred and are generally used, the "male" bamboo being peculiarly tough and elastic. The lance is provided with a sling, through which the trooper passes his right arm when the lance is carried slung, the point of the steel shoe fitting into a bucket attached to the right stirrup. A small "deep" loop is also provided, by which the lance can be attached to the saddle when the trooper dismounts. The small flag is removed on service. The head is of the best steel. The Germans, doubtless owing to difficulty in obtaining bamboo, or ash in large quantity straight enough in the grain over a consider-

able length, for lance staves, have adopted a stave of steel tubing as well as one of pine (figs. 2, 3 and 4).

As to the question of the relative efficiency of the lance and the sword as the principal arm for cavalry, it is alleged that the former is less liable to fatigue, more conspicuous, and much in the way when reconnociting in close country, working through woods and the like; that, when unshod ready for the charge, it is awkward to handle, and may be positively dangerous if a horse becomes restive or the rider tries to use both hands at the same time. The thrust be delivered at full speed, it is easily parried and, lastly, that in the mille, when the trooper has no room to use his lance, he will be helpless until he either throws it away or slings it, and cannot use his sword. While admitting the last-mentioned objection, those who favour the lance contend that success in the first shock of contact is all-important, and that this success the lance will certainly obtain, owing to its longer reach, unless the trooper is able to deliver a blow before the swordsman can retaliate, while, in the mille, comes the moment when he may deliver the first blow and give confidence to the young soldier; that the appearance of a lance regiment, preceded as it were by a hedge of steel, has an immense moral effect; that in single combat a lancer, with room to turn, can always defeat an opponent armed with a sword; and, lastly, that in pursuit a lance is terrible to an enemy, whether the latter be mounted or on foot. As in the case of the permanent argument upon whether a sword should be signed mainly for cutting or thrusting, it is unlikely that the dispute as to the merits of the lance over the sword will ever be definitely settled, since so many other factors—manners, the training of the horse, the skill and courage of the adversary—determine the success of the lance to the same extent as the weapon he happens to wield. As facing, bowing passage, and en-treche from Cybernetics History and Tactics (London, 1853), by Captain Nolan, explains the how the sword and pistol popular in Austria:—"In the last Hungarian war (1848-49) the Hungarian cavalry . . . were so frequently successful against the Austrian heavy cavalry—cuirassiers and dragons; but when they met the Polish Lancers, the finest regiments of light horse in the Austrian service, distinguished for their discipline, good riding, and, above all, for their wonderful skill and accuracy in action, against those the Hungarians were not successful, and at once attributed this to the lances of their opponents. The Austrians then entoiled the lance above the sword, and armed all their light cavalry regiments with it.''

The lancer regiment in the British service are the 5th, the 9th, the 12th, the 16th, the 17th and the 21st. All these were converted at different dates from hussars and light dragons, the last-named in 1896. The typical lancer uniform is a light-fitting short-skirted frock with a double breasted front, called the plastron, of blue, red or other colour, a girdle, and a flat-topped lance "cap," adapted from the Polish czapka (see UNIFORMS: Naval and Military). The British lancers, with the exception of the 10th, who wear scarlet with blue facings, and the 5th, 9th and 12th having scarlet facings and green, black and red plumes respectively, the 17th (famous as the "death or glory boys") and wearing a skull and crossbones badge white facings and white plume, and the 21st light-blue facings and plume.
LANCELOT (Lancelot du Lac, or Lancelot of the Lake), a famous figure in the Arthurian cycle of romances. To the great majority of English readers the name of no knight of King Arthur's court is so familiar as that of Sir Lancelot. The mention of Arthur and the Round Table at once brings him to mind as the most valiant member of that brotherhood and the secret lover of the Queen. Lancelot, however, is not an original member of the cycle, and the development of his story is still a source of considerable perplexity to the critic.

Brieferly summarized, the outline of his career, as given in the German Lancelot and the French prose Lancelot, is as follows: Lancelot was the only child of King Ban of Benoic and his queen Helaine. While yet a infant, his father was driven from his kingdom, either by a revolt of his subjects, caused by his own harshness (Lancelot), or by the action of his enemy Claudas de la Deserte (Lancelot). King and queen fly, carrying the child with them, and while the wife is tending her husband, who dies of a broken heart on his flight, the infant is carried off by a friendly water-fairy, the Lady of the Lake, who brings the boy up in her mysterious kingdom. In the German poem this is a veritable "Isle of Maidens," where no man ever enters, and where it is perpetual spring. In the prose Lancelot, on the other hand, the Lake is but a mirage, and the Lady's court does not lack its complement of gallant knights; moreover the boy has the companionship of his cousins, Lionel and Bohort, who, like himself, have been driven from their kingdom by Claudas. When he reaches the customary age (which appears to be fifteen), the young Lancelot, suitably equipped, is sent out into the world.

In both versions his name and parentage are concealed, in the Lancelot he is genuinely ignorant of both; here too his lack of all knightly accomplishments (not unnatural when we remember he has here been brought up entirely by women) and his inability to handle a steed are insisted upon. Here he rides forth in search of what adventure may bring. In the prose Lancelot his education is complete, he knows his name and parentage; but for some unexplained reason he keeps both secret, and he goes with a fitting escort and equipment to Arthur's court to demand knighthood. The subsequent adventures differ widely: in the Lancelot he ultimately re-conquers his kingdom, and, with his wife Ililis, reigns over it in peace, both living to see their children's children, and dying on the same day, in good old fairy-tale fashion. In fact, the whole of the Lancelot has much more the character of a fairy or folk-tale than that of a knightly romance.

In the prose version, Lancelot, from his first appearance at court, conceives a passion for the queen, who is very considerably his senior, his birth taking place some time after her marriage to Arthur. This infatuation colours all his later career. He frees her from imprisonment in the castle of Meleagant, who has carried her off against her will—(a similar adventure is related in Lancelot, where the abductor is Vairon, and Lancelot is not the rescuer)—and, although he recovers his kingdom from Claudas, he is prevented from accepting the crown by the right of primogeniture. He is given the rule of the lake instead: and in the Lake lives the Lady of the Lake, or La Chevalier, with whom he is eventually joined by the entire court of Arthur. This leads to a number of adventures, and to a number of love-affairs, none of which is particularly moving.

Lancelot, taking no part in the last fatal conflict, outlives both king and queen, and the downfall of the Round Table. Finally, retiring to a hermitage, he ends his days in the odour of sanctity. The process whereby the independent hero of the Lancelot (who, though his mother is Arthur's sister, has but the slightest connexion with the British king), the faithful husband of Ibilis, became converted into the principal ornament of Arthur's court, and the devoted lover of the queen, is by no means easy to follow, nor do other works of the cycle explain the transformation. In the pseudo-chronicles, the Historia de Geoffrey and the translations by Wace and Layamon, Lancelot does not appear at all; the queen's lover, whose guilty passion is fully returned, is Mordred. Chrétien de Troyes' treatment of him is contradictory; in the Erec, his earliest extant poem, Lancelot's name appears as third on the list of the knights of Arthur's court. (It is well, however, to bear in mind the possibility of later addition or alteration in such lists.) In Chigi he again ranks as third, being overthrown by the hero of the poem. In Le Chevalier de la Charrette, however, which followed Chigi, we find Lancelot alike as leading knight of the court and lover of the queen, in fact, precisely in the position he occupies in the prose romance, where, indeed, the section dealing with this adventure is, as Gaston Paris clearly proved, an almost literal adaptation of Chrétien's poem. The subject of the poem is the rescue of the queen from her abductor Meleagant; and what makes the matter more perplexing is that Chrétien handles the situation as one with which his hearers are already familiar; it is Lancelot, and not Arthur or another, to whom the office of rescuer naturally belongs. After this it is surprising to find that in his next poem, Le Chevalier au Lion, Lancelot is once, and only once, casually referred to, and that in a passing reference to his rescue of the queen. In the Percolog, Chrétien's last work, he does not appear at all, and yet much of the action passes at Arthur's court.

The story of Lancelot's adventures added at various times to Chrétien's unfinished work the rôle assigned to Lancelot is equally modest. Among the fifteen knights selected by Arthur to accompany him to Chastel Orguellous he only ranks ninth. In the version of the Luit de Tristan inserted by Gerbert in his Percolog, he is publicly overthrown and shamed by Tristan. Nowhere is he treated with anything approaching the importance assigned to him in the prose versions. Welsh tradition does not know him; early Italian records, which have preserved the names of Arthur and Gawain, have no reference to Lancelot; among the group of Arthurian knights figured on the architrave of the north doorway of Modena cathedral (a work of the 12th century) he finds no place; the real cause for his apparently sudden and triumphant rise to popularity is extremely difficult to determine.

What appears the most probable solution is that which regards Lancelot as the hero of an independent and widely diffused folk-tale, which, owing to certain special circumstances, was brought into contact with, and incorporated in, the Arthurian tradition. This much has been proved: among the adventures recounted in the Lancelot; the theft of an infant by a water-fairy; the appearance of the hero three consecutive days, in three different disguises, at a tournament; the rescue of a queen, or princess, from an Other-World prison, all belong to one well-known and widely-spread folk-tale, variants of which are found in almost every land, and of which numerous examples have been collected alike by M. Cosquin in his Contes Lorrains, and by J. F. Campbell in his Tales of the West Highlands.

The story of the loves of Lancelot and Guenevere, as related by Chrétien, has about it nothing spontaneous and genuine; in no way can it be compared with the story of Tristan and Isolde. It is the exposition of a relation governed by artificial and arbitrary rules, to which the principal actors in the drama must perforce conform. Chrétien states that he composed the poem (which he left to be completed by Godefredo de Leygn) at the request of the countess Marie of Champagne, who provided him with matière et son. Marie was the daughter of Louis VII. of France and of Eleanor of Aquitaine, subsequently wife of...
Henry II. of Anjou and England. It is a matter of history that both mother and daughter were active agents in fostering that view of the social relations of the sexes which found its most famous expression in the "Courts of Love," and which was responsible for the dictum that love between husband and wife was impossible. The logical conclusion appears to be that the Charrette poem is a "Tendens-Schrift," composed under certain special conditions, in response to a special demand. The story of Tristan and Isolde, immensely popular as it was, was too genuine—to shall we say too crude?—to satisfy the taste of the court for which Chrétien was writing. Moreover, the Arthurian story was the popular story of the day, and Tristan did not belong to the magic circle, though he was ultimately introduced, somewhat clumsily, it must be admitted, within its bounds. The Arthurian cycle must have its own love-tale; Guenevere, the leading lady of that cycle, could not be behind the courtly ladies of the late feudal period, who are said to have been, by Gaston Paris, is contained in vol. xxx. of Histoire littéraire de la France. For critical studies on the subject cf. Gaston Paris's articles in Romantica, vol. x. and xii.; Wechsler, Die verschiedenen Redaktionen des Grail Lancelot Cycldes; J. L. Weston, The Legend of Sir Lancelot dari die (Grimm Library, vol. xii.); and The Three Days' Tournament (Grimm Library, vol. xv.) an appendix to the previous vol. (J. L. W.)

LANCET (from Fr. lancet, dim. of lance, lance), the name given to a surgical instrument, with a narrow two-edged blade and a lance-shaped point, used for opening abscesses, &c. The term is applied, in architecture, to a form of the pointed arch, and to a window of which the head is a lancet-arch.

LANEWOOD, a straight-grained, tough, light elastic wood obtained from the West Indies and Guiana. It is brought into commerce in the form of taper poles of about 20 ft. in length and from 6 to 8 in. in diameter at the thickest end. Lanelwood is used by carriage-builders for shafts; but since the practice of employing curved shafts has come largely into use it is not in so great demand as formerly. The smallest wood is used for whip-handles, for the tops of fishing-rods, and for various minor purposes where even-grained elastic wood is a desideratum. The wood is obtained from two members of the natural order Anonaceae. The black lanewood or carisiri of Guiana (Guatteria sagrata) grows to a height of 50 ft., is of remarkably slender form, and seldom yields wood more than 8 in. diameter. The yellow lanewood tree (Duguetia guianensis, yari-yari, of Guiana) is of similar dimensions, found in tolerable abundance throughout Guiana, and used by the Indians for arrow-points, as well as for spars, beams, &c.

LAN-CHOW-FU, the chief town of the Chinese province of Kan-suh, and one of the most important cities of the interior part of the empire, on the right bank of the Hwang-ho. The population is estimated at 175,000. The houses, with very few exceptions, are built of adobe bricks. The streets are paved with blocks of granite and marble. Silks, wood-carvings, silver and jade ornaments, tin and copper wares, fruits and tobacco are the chief articles of the local trade. Tobacco is very extensively cultivated in the vicinity.

LANCIANO (anc. Anxanum), a town and episcopal see of the Abruzzi, Italy, in the province of Chieti, situated on three hills, 834 ft. above sea-level, about 8 m. from the Adriatic coast and 12 m. S.E. of Chieti. Pop. (1901) 7642 (town), 18,316 (commune). It has a railway station on the coast railway, 19 m. S.E. of Castellammare Adriatico. It has broad, regular streets, and several fine buildings. The cathedral, an imposing structure with a fine clock-tower of 1610, is built upon bridges of brickwork, dating perhaps from the Roman period (though the inscription attributing the work to Diocletian is a forgery), that span the valley of the Trebbia, and is dedicated to S. Maria del Monte, Our Lady of the Bridge. The Gothic church of S. Maria Maggiore dates from 1227 and has a fine façade, with a portal of 1337 by a local sculptor. The processional cross by the silversmith Nicola di Guardiagrele (1422) is very beautiful. In S. Nicola is a fine reliquary of 1445 by Nicola di Francavilla. The church of the Annunziata has a good rose window of 1362. The industries of the town, famous in the middle ages, have declined. Anxanum belonged originally to the tribe of the Freninati and later became a municipium. It lay on the ancient highroad,
which abandoned the coast at Ortona 10 m. to the N. and returned to it at Histionum (Vasto). Remains of a Roman theatre exist under the bishop's palace.

See V. Bindl, *Monumenti degli Abruzzi* (Naples, 1889, 609 sqq.), and for discoveries in the neighbourhood see A. de Nino in *Notizie degli scavi* (1884), 431. (T. AS.)

LANCRET, NICOLAS (1660–1743), French painter, was born in Paris on the 22nd of January 1660, and became a brilliant depicter of light comedy which reflected the tastes and manners of French society under the regent Orleans. His first master was Pierre d’Ulin, but his acquaintance with and admiration for Watteau induced him to leave d’Ulin for Gillot, whose pupil Watteau had been. Two pictures painted by Lancret and exhibited on the Place Dauphine had a great success, which laid the foundation of his fortune, and, it is said, estranged Watteau, who had been complimented as their author. Lancret’s work cannot now, however, be taken for that of Watteau, for both in drawing and in painting his touch, although intelligent, is dry, hard and wanting in that quality which distinguishes the great model; these characteristics are due possibly in part to the fact that he had been for some time in training under an engraver. The number of his paintings (of which over eighty have been engraved) is immense; he executed a few portraits and attempted historical composition, but his favourite subjects were balls, fairs, village weddings, &c. The British Museum possesses an admirable series of studies by Lancret in red chalk, and the National Gallery, London, shows four paintings—the “Four Ages of Man” (engraved by Desplaces and l’Armessin), cited by d’Arcgenville amongst the principal works of Lancret. In 1719 he was received as Academician, and became councillor in 1735; in 1741 he married a grandchild of Boursault, author of *Aesop at Court*. He died on the 14th of September 1743.

See d’Arcgenville, *Vies des peintres; and Ballot de Sovot, Éloge de M. Lancret* (1743, new ed. 1774).

LAND, the general term for that part of the earth’s surface which is solid and dry as opposed to sea or water. The word is common to Teutonic languages, mainly in the same form and with essentially the same meaning. The Celtic cognate forms are Irish *lann*, Welsh *llan*, and Irish *lannan*, also of “church,” and so of constant occurrence in Welsh place-names, Cornish *lan* and Breton *lann*, health, which has given the French *lande*, an expanse or tract of sandy waste ground. The ultimate root is unknown. From its primary meaning have developed naturally the various uses of the word, for a tract of ground or country viewed either as a political, geographical or ethnographical division of the earth, as property owned by the public or state or by a private individual, or as the rural as opposed to the urban or the cultivated as opposed to the built on part of the country; of particular meanings may be mentioned that of a building divided into tenements or flats, the divisions being known as “houses,” a Scottish usage, and also that of a division of a ploughed field marked by the irrigating channels, hence transferred to the smooth parts of the bore of a rifle between the grooves of the rifling.

For the physical geography of the land, as the solid portion of the surface, see GEOGRAPHY. For land as the subject of cultivation see AGRICULTURE and SOIL, also, RECLAMATION OF LAND. For the history of the holding or tenure of land see VILLAGE COMMUNITIES and FEUDALISM: a particular form of land tenure is dealt with under METATAXY. The article *AGRALE* in the sense of deals with the disposal of the public land (*Ager publicus*) in Ancient Rome, and further information with regard to the part played by the land question in Roman history will be found under Rome, § History. The cultivation of land is treated under REAL PROPERTY and CONVEYANCING (see also LANDLORD and TENANT, and LAND REGISTRATION).

LANDAU, a town in the Bavarian Palatinate, on the Queich, lying under the eastern slope of the Hardt Mountains, 32 m. by rail S.W. from Mannheim, at the junction of lines to Neustadt an der Hardt, Weissenburg and Saarbrücken. Pop. (1905) 17,165. Among its buildings are the Gothic Evangelical church, dating from 1285; the chapel of St Catherine built in 1344; the church of the former Augustinian monastery, dating from 1405; and the Augustinian monastery itself, founded in 1276 and now converted into a brewery. There are manufactures of cigars, beer, hats, watches, furniture and machines, and a trade in wine, fruit and cereals. Large cattle-markets are held here. Landau was founded in 1224, becoming an imperial city fifty years later. This dignity was soon lost, as in 1357 it passed to the bishopric of Spires and in 1331 to the Palatinate, recovering its former position in 1351. Captured eight times during the Thirty Years’ War the town was ceded to France by the treaty of Westphalia in 1648, although with certain ill-defined reservations. In 1670 Louis XIV. definitely took possession of Landau. Its fortifications were greatly strengthened; nevertheless it was twice taken by the Imperialists and twice recovered by the French during the Spanish Succession War. In 1815 it was given to Austria and in the following year to Bavaria. The fortifications were finally dismantled in 1871.

The town is commonly supposed to have given its name to the four-wheeled carriage, with an adjustable divided top for use either open or closed, known as a “landau” (Ger. *Landauer*). But this derivation is doubtful, the origin of the name being also ascribed to that of an English carriage-builder, Landy, who introduced the style into England.

See LAMMERM, *Bad Landek (Glatz, 1872); Schulze, Die Thermen von Landek* (Berlin, 1885); Wehle, *Bad Landek* (Breslau, 1886); Joseph, *Die Thermen von Landek* (Berlin, 1887), and Patschovsky, *Führer durch Bad Landek und Umgebung* (Schweidnitz, 1902).

LANDEK, a town and spa in the Prussian province of Silesia, on the Biele, 73 m. by rail S. of Breslau and close to the Austrian frontier. Pop. (1905) 3,451. It is situated at an altitude of 1450 ft. It has manufactures of gloves. Landek is visited by nearly 10,000 people annually on account of its warm sulphur baths, which have been known since the 13th century. In the neighbourhood are the ruins of the castle of Karpenstein.

LANDEN, JOHN (1719–1790), English mathematician, was born at Peakirk near Peterborough in Northamptonshire on the 23rd of January 1710, and died on the 15th of January 1790 at Milton in the same county. He lived a very retired life, and saw little or nothing of society; when he did mingle in it, his dogmatism and pugnacity caused him to be generally shunned. In 1762 he was appointed agent to the Earl Fitzwilliam, and held that office until 1772. He was called the first known as a mathematician by his essays in the *Ladies’ Diary* for 1744. In 1766 he was elected a fellow of the Royal Society. He was well acquainted with the works of the mathematicians of his own time, and has been called the “English d’Alembert.” In his *Discourse on the “Residual Analysis,”* he proposes to avoid the metaphysical difficulties of the method of fluxions by a purely algebraical method. The idea may be compared with that of Joseph Louis Lagrange’s *Calcul des Fonctions.* His memoir (1775) on the rotary motion of a body contains (as the author was aware) conclusions at variance with those arrived at by Jean le Rond, d’Alembert and Leonhard Euler in their researches on the same subject. He reproduces and further develops and defends his own views in his *Mathematical Memoirs,* and in his paper in the *Philosophical Transactions* for 1785. But Landen’s capital discovery is that of the theorem known by his name (obtained in its complete form in the memoir of 1775, and reproduced in the first volume of the *Mathematical Memoirs*) for the expression of the arc of an hyperbola in terms of two elliptic arcs. His researches on elliptic functions are of considerable elegance, but their great merit lies in the stimulating effect which they had on later mathematicians. He also showed that the roots of a cubic equation can be derived by means of the infinitesimal calculus.

The list of his writings is as follows:—*Ladies’ Diary,* various communications (1744–1760); papers in the *Phil. Trans.* (1745, 1760, 1768, 1771, 1775, 1777, 1785); *Mathematical Ludibrations* (1755); *A Discourse concerning the Residual Analysis* (1758); *The Residual of computing the Sun’s Distance from the Earth* (1777); *Mathematical Memoirs* (1786, 1789).
LANDES—LANDES

LANDES, a town in the province of Liége, Belgium, an important junction for lines of railway from Limburg, Liége and Louvain. Pop. (1904) 2874. It is the birthplace of the first Pippin, distinguished as Pippin of Landes from his grandson Pippin of Herstal. In 1603 the French under Marshal Luxembourg defeated here the Anglo-Dutch army under William III. This battle is also called Neerwinden from a village 3 m. W. of Landen. In 1793 the French under Frederick of Saxe-Coburg and Clerfayt defeated the French under Dumouriez.

LANDER, RICHARD LEMON (1804–1834) and JOHN (1807–1839), English explorers of the Niger, were natives of Cornwall, sons of an innkeeper at Truro. At the age of eleven Richard went to the West Indies in the service of a merchant. Returning to England after an absence of three years he took service with various wealthy families, with whom he travelled on the continent. In 1821 he accompanied Major (afterwards General Sir) W. M. Colebrooke, on a tour through Cape Colony. In 1825 Richard offered his services to Hugh Clapperton, then preparing for his second expedition to West Africa. He was Clapperton's devoted servant and companion in this expedition, and on Clapperton's death near Sokoto in April 1827 Richard Lander, after visiting Kano and other parts of the Hausa states, returned to the Guinea coast through Yoruba bringing with him Clapperton's journal. To this on its publication (1829) was added The Journal of Richard Lander from Kano to the Coast, and in the next year Lander published another account of the expedition entitled Records of Captain Clapperton's Last Expedition to Africa... with the subsequent Adventures of the Author. To this narrative he prefixed an autobiographical note. Richard Lander, though without any scientific attainments, had exhibited such capacity for exploration that the British government decided to send him out to determine the course of the lower Niger. In the expedition he was accompanied by his brother John, by trade a printer, and better educated than Richard, who went as an unsalaried volunteer. Leaving England in January 1830, the brothers landed at Badagry on the Guinea coast on the 22nd of March. They then travelled by the route previously taken by Clapperton to Bussa on the right bank of the Niger, reached on the 17th of June. Thence they ascended the river for about 100 m. Going back to Bussa the travellers began, on the 20th of September, the descent of the river, not knowing whither it would lead them. They journeyed in canoes accompanied by a few negroes, their only scientific instrument a common compass. They discovered the Benue river, ascertainning when passing its confluence, by paddling against its stream, the correct direction. At the beginning of the delta they were captured by the Ibos, from whom they were ransomed by "King Boy" of Brass Town; by him they were taken to the Nun mouth of the river, whence a passage was obtained to Fernando Po, reached on the 1st of December. The Landers were thus able to lay down with approximate correctness the lower course of the Niger—a matter till then as much in dispute as was the question of the Nile sources. In the attack by the Ibos the Landers lost many of their records, but they published a narrative of their discoveries in 1832, in three small volumes—Journal of an Expedition to Explore the Course and Termination of the Niger. In recognition of his services the Royal Geographical Society—for med two years previously—granted Richard Lander in 1832 the royal medal, he being the first recipient of such an award. In the same year Richard went to Africa again as leader of an expedition organized by Macgregor Laird and other Liverpool merchants to open up trade on the Niger and to found a commercial settlement at the junction of the Benue with the main stream. The expedition encountered many difficulties, suffered great mortality from fever, and was not able to reach Bussa. Lander made several journeys up and down stream, and while going up the river in a canoe was attacked by the natives on the 20th of January 1834 at a spot about 84 m. above the Nun mouth, and wounded by a musket ball in the thigh. He was removed to Fernando Po, where he died on the 6th of February. John Lander, who on his return to England in 1831 obtained a situation at the London customs house, died on the 16th of November 1839 of a disease contracted in Africa.

See, besides the books mentioned, the Narrative of the Niger expedition of 1832–1834, published in 1837 by Macgregor Laird and R. A. K. Oldfield.

LANDES, a department in the south-west of France, formed in 1790 of portions of the ancient provinces of Guyenne (Landes, Condamnos Chalosse); Gascony and Béarn, and bounded N. by Gironde, E. by Lot-et-Garonne and Gers, S. by Basses Pyrénées, and W. (for 68 m.) by the Bay of Biscay. Pop. (1906) 293,397. Its area, 3515 sq. m., is second only to that of the department of Gironde. The department takes its name from the Landes, which occupy three-quarters of its surface, or practically the whole region north of the Adour, the chief river of the department. They are separated from the sea by a belt of dunes fringed on the east by a chain of lakes. South of the Adour lies the Chalosse—a hilly region, intersected by the Gabas, Luy and Gave de Pau, left-hand tributaries of the Adour, which descend from the Pyrenees. On the right the Adour is joined by the Midiouze, formed by the junction of the Douze and the Midou. The climate of Landes is the Girondine, which prevails from the Loire to the Pyrenees. Snow is almost unknown, the spring is rainy, the summer warm and stormy. The prevailing wind is the south-west, and the mean temperature of the year is 53° F., the thermometer hardly ever rising above 82° or falling below 14°. The annual rainfall in the south of the department in the neighbourhood of the sea reaches 55 in., but diminishes by more than half towards the north-east.

The fertility of La Chalosse is counterbalanced by the comparative poorness of the soil of the Landes, and small though the population in the department does not produce wheat enough for its own consumption. The chief cereal is maize; next in importance are rye, wheat and millet. Of vegetables, the bean is most cultivated. The vine is grown in the Chalosse, sheep are numerous, and the "Landes" breed of horses is well known. Forests, chiefly composed of pines, occupy more than half the department, and their exploitation forms the chief industry. The resin of the maritime pine furnishes by distillation essence of turpentine, and from the residue are obtained various qualities of resin, which serve to make varnish, tapers, sealing-wax and lubricants. Tar, and an excellent charcoal for smelting purposes, are also obtained from the pine-wood. The department has several mineral springs, the most important being those of Dax, which were frequented in the time of the Romans, and of Eugénie-les-Bains and Préchacq. The cultivation of the cork tree is also important. There are salt-working stations and stone quarries. There are several iron-works in the department; those at Le Boucau, at the mouth of the Adour, are the most important. There are also saw-mills, distilleries, flour-mills, brick and tile works and potteries. Exports include resinous products, pine-timber, metal, brandy; leading imports are grain, coal, iron, millinery and furniture. In its long extent of coast the department has no considerable port. Opposite Cape Breton, however, where the Adour formerly entered the sea, there is, close to land, a deep channel where there is safe anchorage. It was from this once important harbour of Capbreton that the discoverers of the Canadian island of that name set out. Landes includes three arrondissements (Mont-de-Marsan, Dax and St Sever), 28 cantons and 334 communes.

Mont-de-Marsan is the capital of the department, which comes within the circumscription of the appeal court of Pau, the académie (educational division) of Bordeaux and the archbishopric of Auch, and forms part of the region of the 18th army corps. It is served by the Southern railway; there is some navigation on the Adour, but that upon the other rivers is of little importance. Mont-de-Marsan, Dax, St Sever and Aire-sur-l'Adour, the most noteworthy towns, receive separate notice. Hagetmau has a church built over a Romanesque crypt, the roof of which is supported on columns with elaborately-carved capitals. Sorde has an interesting abbey-church of the 13th and 14th centuries.

LANDES, an extensive natural region of south-western France, known more strictly as the Landes de Gascons. It has an area
LANDESHUT—LANDLORD AND TENANT

Law of England.—The law of England—and the laws of Scotland and Ireland agree with it on this point—recognizes no absolute private ownership of land. The absolute and ultimate owner of all land is the crown, and the highest interest that a subject can hold therein—viz. an estate in fee simple—is only a tenancy. But this aspect of the law, under which the landlord, other than the crown, is himself always a tenant, falls beyond the scope of the present article, which is restricted to those holdings that arise from the hiring and leasing of land.

The legal relationship of landlord and tenant is constituted by a lease, or an agreement for a lease, by assignment, by attornment and by estoppel. And first of a lease and an agreement for a lease. All kinds of interests and property, whether corporeal, such as lands or buildings, or incorporeal, such as rights of common or of way, may be let. The Benefices Act 1858, however, now prohibits the grant of a lease of an advowson. Titles of honour, offices of trust or relating to the administration of justice, and pensions granted by the crown for military services are also inalienable. Generally speaking, any person may grant or take a lease. But there are a number of common-law and statutory qualifications and exceptions. A lease by or to an infant is voidable at his option. But extensive powers of leasing the property of infants have been created by the Settled Estates Act 1877 and the Settled Land Act 1882. A person of unsound mind can grant or take a lease if he is capable of contracting. Leases may be made on behalf of lunatics subject to the jurisdiction in lunacy under the provisions of the Lunacy Act 1800 and the Settled Land Act 1882. A married woman can lease her “separate property” apart from or under the Married Women’s Property Acts, as if she were a single woman (feme sole). As regards other property, the concurrence of her husband is generally necessary. An alien was, at common law, incapable of being either a lessor or a lessee. But this disqualification is removed by the Naturalization Act 1870. The right to deal with the property of a convict while he is undergoing sentence (but not while he is out of prison on leave) is, by the Forfeititure Act 1879, vested in his administrator.

Leases of or to corporations must be by deed under their common seal, and the leasing powers of ecclesiastical corporations in particular are subject to complicated statutory restrictions which cannot here be examined (see Phillimore, ECCL. LAW, 2nd ed., p. 1281). Powers of granting building and other leases have been conferred by modern legislation on municipal corporations and other local authorities.

A person having an interest in land can, in general, create a valid interest only to the extent of that interest. Thus a tenant for years, or even from year to year only, may stand in his turn as landlord to another tenant. If he profess, however, to create a tenancy for a period longer than that to which his own interest extends, he does not thereby give to his tenant an interest available against the reversioner or remainder man. The subtenant’s interest will expire with the interest of the person who created it. But as between the subtenant and his immediate assignee, the interest will be good and should the interest of the lessor become greater than it was when the subtenancy was created the subtenant will have the benefit of it. On his side, again, the subtenant, by accepting that position, is estopped from denying that his lessor’s title (whatever it be) is good. There are also special rules of law with reference to leases by persons having only a limited interest in the property leased, e.g. a tenant for life under the Settled Land Acts, or a mortgagee or mortgagee.

The Letting.—To constitute the relationship of landlord and tenant in the mode under consideration, it is necessary not only that there should be parties capable of entering into the contract, but that there should be a letting, as distinct from a mere agreement to let, and that the right conveyed should be a right to the exclusive possession of the subject of the letting and not a simple licence to use it. Whether a particular instrument is a lease, or an agreement for a lease, or a bare licence, is a question the answer to which depends to a large extent on the circumstances of individual cases; and the only general rule

of 5400 sq. m., and occupies three-quarters of the department of Landes, half of that of Gironde, and some 175,000 acres of Lot-et-Garonne. The Landes, formerly a vast tract of moorland and marsh, now consist chiefly of fields and forests of pines. They form a plateau, shaped like a triangle, the base of which is the Atlantic coast while the apex is situated slightly west of Nérac (Lot-et-Garonne). Its limits are, on the S. the river Adour; on the E. the hills of Armagnac, Eauzan, Condominos, Agenais and Bazadais; and on the N.E. the Garonne, the hills of Médoc and the Gironde. The height of the plateau ranges in general from 130 to 260 ft.; the highest altitude (428 ft.) is found in the east near Baudignan (department of Landes), from which point there is a gradual slope towards north, south, east and west. The soil is naturally sterile. It is composed of fine sand resting on a subsoil of tuft (alias) impermeable by water; for three-quarters of the year, consequently, the waters, settling on the almost level surface and unable to filter through, used to transform the country into unwholesome swamps, which the Landesmen could only traverse on stilts. About the middle of the 18th century an engineer, François Chambrelent, instituted a scheme of draining and planting to remedy these evils. As a result about 1600 m. of ditches have been dug which carry off superficial water either to streams or to the lakes which fringe the landes on the west, and over 1,600,000 acres have been planted with maritime pines and oaks. The coast, for a breadth of about 4 m., and over an area of about 225,000 acres, is bordered by dunes, in ranges parallel to the shore, and from 100 to 300 ft. in height. Driven by the west wind, which is most frequent in these parts, the dunes were slowly advancing year by year towards the east, burying the cultivated lands and even the houses. Nicolas Thomas Brémontier, towards the end of the 18th century, devised the plan of arresting this course by planting the dunes with maritime pines. Upwards of 200,000 acres have been thus treated. In the south-west, cork trees take the place of the pines. To prevent the formation of fresh dunes, a “dune littorale” has been formed by means of a palisade. This barrier, from 20 to 30 ft. high, presents an obstacle which the sand cannot cross. On the eastern side of the dunes is a series of lakes (Hourin et Carcans, Lacanau, Cazau or Sanguinet, Biscarrosse, Aureilhan, St Julien, Léon and Soustons) separated from the sea by the heaping up of the sand. The salt water has escaped by deflation, and they are now quite fresh. The Basin of Arcachon, which lies midway between the lakes of Lacanau and Cazau, still communicates with the ocean, the current of the Leyre which flows into it having sufficient force to keep a passage open.

LANDESHUT, a town in the Prussian province of Silesia, at the north foot of the Riesengebirge, and on the river Bober, 65 m. S.W. of Breslau by rail. Pop. (1905) 9000. Its main industries are flax-spinning, linen-weaving and manufactures of cloth, shoes and beer. The town dates from the 13th century, being originally a fortress built for protection against the Bohemians. There the Poles and the Prussians defeated the Austrians in May 1730, and in June 1736 the Prussians were routed by a greatly superior force of Austrians.

See Perschke, Beschreibung und Geschichte der Stadt Landesheut (Breslau, 1829).

LANDGRAVE (Ger. Landgraf, from Land, “a country” and Graf, “count”), a German title of nobility surviving from the times of the Holy Roman Empire. It originally signified a count of more than usual power or dignity, and in some cases implied sovereignty. The title is now rare; it is borne by the former sovereign of Hesse-Homburg, now incorporated in Prussia, the heads of the various branches of the house of Hesse, and by a branch of the family of Fürstenberg. In other cases the title of landgrawe is borne by German sovereigns as a subsidiary title; e.g. the grand-duke of Saxo-Weimar is landgrave of Thuiringa.

LANDLORD AND TENANT. In Roman Law, the relationship of landlord and tenant arose from the contract of letting and hiring (locatio conductio), and existed also with special incidents, under the forms of tenure known as emphyteusis—the long lease of Roman law—and prœcriptum, or tenancy at will (see Roman Law).
is that in a lease there must be an expression of intention on the part of the lessor to convey, and of the lessee to accept, the exclusive possession of the thing let for the prescribed term and on the prescribed conditions. The lease may be either oral or written, and is treated as a contract, if he does so, the instrument is not a lease but an assignment. Where a tenant enters under an agreement for a lease and pays rent, the agreement will be regarded as a lease from year to year; and if the agreement is one of which specific performance would be decreed (i.e. if it contains a complete contract between the parties and satisfies the provisions—to be noted immediately—of the Statute of Frauds, and if, in all the circumstances, its enforcement is just and equitable), the lessee is treated as having a lease for the term fixed in the agreement from the time that he took possession under it, just as if a valid lease had been executed. At common law a lease for a term of years (other than a lease by a corporation) might be made by parol. But under the Statute of Frauds (1677), ss. 1, 2) leases, except those the term of which does not exceed three years, and in which the reserved rent is equal to two-thirds at least of the improved value of the premises, were required to be in writing signed by the parties or their lawfully authorized agents; and, under the Real Property Act 1845, a lease for a term of years is to be made by deed. The Statute of Frauds also prohibits an action from being brought upon any agreement for a lease, for any term, unless such agreement is in writing and signed by the party to be charged therewith or by some other agent lawfully authorized by him.

Forms of Tenancy.—The following are the principal forms of tenancy: (i.) Tenancy for Life.—A lease for life must be made by deed, and the term may be that of a single person or the joint lives of two or more persons, or persons, and in the latter case either for their joint lives or for the life of the survivor; also for the lives of the lessee himself and of some other person or persons, and this constitutes a single estate. A tenant for life under a settlement made under the Act 1882, he may lease the settled land, or any part of it, for any time not exceeding (a) in the case of a building lease, 99 years; (b) in the case of a mining lease, 60 years; (c) in the case of any other lease, 21 years. He holds the lease for life, the proceeds of which is to be used for purposes of superficies, or for the re-investment in the land of the mines and minerals, or a lease of the minerals without the surface. A lease under the Settled Land Act 1882 must be by deed and must be made to take effect in possession not later than 12 months after its date; the rent that can reasonably be obtained must be reserved and the lease must contain a covenant by the lessee for payment of the rent, and a condition of re-entry on non-payment within a specified time not exceeding 30 days. (ii.) Tenancy for Years.—A lease for years is a term without end. The express contract between the parties and never by implication, as in the case of tenancy from year to year and tenancy at will. Here the tenancy ends on the expiry of the prescribed term, without notice to quit; and the landlord may at any time, within the term, by notice in writing, determine the tenancy, in the absence of an expiry in the contract. This tenancy may be created by express agreement between the parties, or by implication as, e.g., a person enters and pays rent under a lease for years, void either by law or by statute, or by the arrangement of a lease whether for years or otherwise. In the absence of express agreement or custom or statutory provision (such as is made by the Agricultural Holdings Act 1883), a tenancy from year to year is determinable on half a year’s notice expiring at the end of some current year of the tenancy. Where there is no express stipulation creating a yearly tenancy, if the parties have contracted that the tenant may be dispossessed by notice given at any time, effective from the expiration of the term, such provision is valid whether or not the tenancy is created by the lessee of the demised premises, and covenants by the lessee to pay rent, to pay taxes, except such as fall upon the landlord, to keep the premises in repair, and to allow the landlord to enter and take possession of the premises without notice. Where under the contract the lessee shall have certain powers of assignment or subletting, these terms must be express or implied, and the lessee’s assignment or subletting powers must not be personal to the original lessor. A tenant cannot assign, or underlet without license, or to his own servants, or to his own serfdom. At common law, a tenant can assign the premises to a person other than the landlord, and he can enter into a lease or sublease, and give no notice to quit, for the purpose of securing the exclusive possession of the premises from the expiration of the lease. A tenant is not entitled to assign, or underlet, or to hold the premises for the purposes of assignment or subletting. A tenant cannot assign the premises without the consent of the landlord. A tenancy is not a tenancy at all, inasmuch as if the landlord acquires it, it becomes a tenancy at will; and it is to be regarded merely as a legal fiction which protected the rightful owner from treating the tenant as an intruder, as he has himself made an actual entry on the land and brought an action to recover the land. The Distress for Rent Act 1737, however, enables a landlord to recover double rent from a tenant who holds over after having himself given notice to quit; while another statute in the reign of George II.,—the Landlord and Tenant Prevention of Distress for Rent Act 1751,—made it an offense for a landlord to receive a notice from his landlord liable to the extent of double the value of the premises. There is no tenancy by sufferance against the crown.

Form of a Lease.—The component parts of a lease are the parties, the recitals (when necessary) setting out such matters as the title of the lessor; the demesne or actual leasing (the word "demesne" is ordinarily used, but any term indicating an express intention to make a present letting is sufficient); the parcels in which the extent of the premises demised is stated; the habendum (which defines the commencement and the term of the lease), the tenant (who shall take the premises); the covenants and the conditions. The Conveyancing Act 1881 provides that, as regards conveyances subsequent to 1881, unless a contrary intention is expressed, a lease of "land" is to be deemed to include all buildings, fixtures, easements, &c., appertaining to it; and, if there are houses or other buildings on the land demised, all out-houses, erections, &c., are to pass with the lease of the land. Rights which the landlord desires to retain over the lands let are excepted or reserved. Sporting rights will pass to the lessee unless reserved (see GAME LAWS). A grant or reservation of minerals in general terms conveys, or reserves, a right to work the mines, subject to the obligation of leaving a reasonable support to the surface, as it exists at the time of the grant or reservation. It is not necessary that a lease should be dated. In the absence of a date, it will take effect from the day of delivery.

Covenants in Leases.—These may be roughly divided into four groups: (i.) Implied Covenants.—A covenant is said to be implied when by a term of the agreement provision is made by one party or both parties, for the benefit of the other party or both parties, for the benefit of the other party. (ii.) Express Covenants.—A covenant is said to be express when the parties make a contract, and there is no doubt as to the terms of the contract. (iii.) Assumed Covenants.—A covenant is said to be assumed when the lessee or his assigns have the right to make the land immediately afterwards in the possession of the lessee, or to his assigns, for the benefit of the land. (iv.) Presumed Covenants.—A covenant is said to be presumed when the lessee or his assigns have the right to make the land immediately afterwards in the possession of the lessee, or to his assigns, for the benefit of the land.
which is part and parcel of the demise, e.g. the payment of rent, the repair of houses or fixtures or machinery already built or set up, or to a thing not in esse at the time of the demise, but touching the land provided that the word "assigns" is used in the covenant. All implied covenants in the lease, or contained by operation of law in leases (covenants to observe and perform the conditions of the premises), may be taken by a covenant by a lessee to give the lessee a right of pre-emption over a piece of land adjoining the subject of the demise, or in the case of a lease of a beer-shop, not to keep any similar shop within a certain radius. If the premises are demised by a lessee to pay rates on premises not demised. A covenant not to assign without the lessor's assent runs with the land and applies to a reassignment to the original lessee. (iv.) Restrictive Covenants.—Such covenants are generally in respect to the scope of the terms "impositions," "charges," "duties," "outgoings," or "burdens." The words, "rates, taxes, assessments" point to payments of a periodic or recurring character. Are the latter words to be understood in the same sense as the former, or is the kind of obligation to be determined by whether it includes single and definite payments demanded, for example, by a local authority, acting under statutory powers, for improvements of a permanent kind affecting the premises demised? The decisions on the subject are not easy to reconcile, but the main issue is whether, on the true construction of the particular covenant, the lessee has undertaken to indemnify the landlord against payments of all kinds. The stronger current of modern authority is in favour of the lessor, for the reason that the lessee may be responsible, or have undertaken to be responsible, for the payment of rates, taxes, assessments, and other charges. But it must be noted that such consent must be applied for even if, under the covenant, it cannot be withheld; and covenants in restraint of trade, e.g. not to use the demised premises for certain trading purposes, and in the case of "covenants of peace," a covenant by the lessees to purchase all required by the lessors.

In addition a lease frequently contains covenants for renewal of the lease at the option of the lessee, and for repairs or insurance against damage by fire by the lessee. If the lease contains a covenant not to assign or underlet without the lessor's consent (it may be noted that such consent must be applied for even if, under the covenant, it cannot be withheld); and covenants in restraint of trade, e.g. not to use the demised premises for certain trading purposes, and in the case of "covenants of peace," a covenant by the lessees to purchase all required by the lessors.

Mutual Rights and Liabilities of Landlord and Tenant.—These are to a large extent regulated by the covenants of the lease. (i.) The landlord generally covenants—and, in the absence of such a proviso, a covenant will be implied from the fact of letting—that the tenant shall have quiet enjoyment of the premises for the time agreed upon. This obligation makes the landlord responsible for any lawful eviction of the tenant during the term, but not for wrongful eviction unless he is himself the wrongdoer or has expressly made himself responsible for evictions of all kinds. It may be noted here that at common law no lease for years is complete till actual entry has been made by the lessee. Till then, he has only a right of entry or interesse termini. (ii.) The tenant, on his part, is presumed to undertake to use the property in a reasonable manner, according to the purposes for which it was let, and to do reasonable repairs. A landlord is not presumed to have undertaken to put the premises in repair, nor to execute repairs.

Repairs. But the respective obligations of parties where repairs are, as they are always in leases for years, the subject of express covenant, may vary indefinitely. The obligation is generally imposed upon the tenant to keep the premises in "good condition" or "tenantable repair." The amount and quality of the repairs necessary to fulfil the covenant are always relative to the age, class and condition of the premises at the time of the lease. A tenant is not responsible, under such a covenant, for deterioration due to diminution in value caused by lapse of time or by the changes. Where there is an unqualified covenant to repair, and the premises during the tenancy are burnt down, or destroyed by some other inevitable calamity, the tenant is bound to rebuild and restore them at his own expense, even although the landlord has taken out a policy on his own account, and it is the responsibility of the insurance company in respect of it. A covenant to keep in repair requires the tenant to put the premises in repair if they are out of it, and to maintain them in that condition up to and at the end of the tenancy. A breach of the covenant to repair gives the landlord an action for damages which will be measured by the estimated injury to the reversion if the action is brought during the tenancy, and by the sum necessary to execute the repairs, if the action be brought later. (iii.) The improper use of the premises to the injury of the reversioner is waste (q.v.). (iv.) Covenants by the tenants to insure the premises and keep them insured are also common; and if the premises are left uninsured for the smallest portion of the term, though there is no damage by fire, the covenant is broken. (v.) Covenants to bear and pay rates and taxes have been discussed above. (vi.) As to the tenant's obligation to pay rent, see RENT.

Assignment, Attornment, Estoppel.—The relationship of landlord and tenant may be altered either voluntarily, by the act of the parties, or involuntarily, by the operation of law, and may also be dissolved. The principal mode of voluntary alteration is an assignment either by the tenant of his term or by the landlord of his reversion. An assignment which creates the relationship of landlord and tenant between the lessor or lessee and the assignee, must be by deed, but the acceptance by a landlord of rent from a tenant under an invalid assignment may create an implied tenancy from year to year; and similarly payment of rent by a tenant may amount to an acknowledgment of his landlord's title. This is one form of tenancy by estoppel. The principle of all tenancies of this kind is that something has been done by the party estopped, amounting to an admission which he cannot be allowed to contradict. "Attornment," or the agreement by a tenant to become tenant to a new landlord, is a term now often used to indicate an acknowledgment of the existence of the relationship of landlord and tenant. It may be noted that it is still common to insert in mortgage deeds what is called an "attornment clause," by which the mortgagee "attorns" tenant to the mortgagee, and the latter thereupon acquires a power of distress as an additional security. If the lands assigned are situated in Middlesex or Yorkshire, the assignment should be registered under the Middlesex Registry or Yorkshire Estates Acts, as the case may be; and similar provision is now made for the registration by an assignee of his title under the Land Transfer Acts 1875 and 1897.

Underlease.—Another form of alteration in a contract of tenancy is an under-lease, which differs from assignment in that the lessor parts with a portion of his estate instead of, as in assignment, with the whole of it. There is no privity of contract between an underlessee and the superior landlord, but the latter can enforce against the former restrictive covenants of which he had notice; it is the duty of the underlessee to inform himself as to the covenants of the original lease, and, if he enters and takes possession, he will be considered to have had full notice of, and will be bound by, these covenants.

Bankruptcy, Death.—The contract of tenancy may also be altered by operation of law. If a tenant become bankrupt, his interest passes to his trustee in bankruptcy—unless, as is frequently the case, the lease makes the occurrence of that contingency determine the lease. So, on the death of a tenant, his interest passes to his legal representative.

Dissolution of Tenancy.—Tenancy is dissolved by the expiry of the term for which it was created, or by forfeiture of the tenant's interest on the ground of the breach of some condition by the tenant and re-entry by the landlord. A breach of condition may, however, be waived by the landlord, and the legislature has made provision for the relief of the tenant from the consequences of such breaches in certain cases. Relief from forfeiture and rights of re-entry are now regulated chiefly by the Conveyancing Acts 1881 and 1882. Under these acts a right of re-entry or forfeiture is not to be enforceable unless and until the lessor has served on the lessee a written notice specifying the breach of covenant or condition complained of, and requiring him to remedy it or make compensation, and this demand has not within a reasonable time been complied with; and when a lessor is proceeding to enforce such a right the court may, if it think fit, grant relief to the lessee. A forfeiture is also waived if the landlord elects not to take advantage of it—and shows his election either expressly or impliedly by some act, which acknowledges the continuance of the tenancy, e.g. by the acceptance of, or even by an absolute and unqualified demand for,
LANDLORD AND TENANT

rent, which has accrued due since the forfeiture, by bringing an action for such rent, or by distraint for rent whether due before or after the forfeiture.

A tenancy may also be determined by merger, i.e. where a greater and a less estate coincide and meet in one and the same person, without any intermediate estate, as, for instance, when a tenant for years obtains the fee simple. There may also be a surrender, either voluntary or by operation of law, which will determine a tenancy, as, for example, when a tenant is party to some act, the validity of which he is legally estopped from denying and which would not have been valid had the tenancy continued to exist.

The land, on the expiration of the tenancy, becomes at common law the absolute property of the landlord, no matter how it may have been altered or improved during the occupation. In certain cases, however, the law has discriminated between the conditions of land under leases and leases. Fixtures (which may be shortly defined as moveables so affixed to the soil as to become part thereof), the tenant may sometimes remove them, e.g. when they have been brought on the premises for the purpose of being used in building (see Fixtures). (2)

In respect of emblements, i.e. the profits of sown land, a tenant may be entitled to these whose term comes to an end by the happening of an uncertain contingency (see EMBLEMENTS).

A similar right is very generally recognized by custom in tenants whose term expires in the ordinary way. The custom of the district, in the absence of stipulations between the parties, would be imported into their contract—the tenant going out on the same conditions as he came in. Such customary tenancy right only arises at the expiration of the lease, and on the substantial performance of the covenants; and is forfeited if the tenant abandons his tenancy during the term. Tenant right is assignable, and will pass under an assignment of "all the estate and interest" of the outgoing tenant in the farm. But, with the exceptions noted, the landlord’s improved condition passes over at common law to the landlord. The tenant may have added to its value by buildings, by labour applied to the land, or by the use of fertilizing manures, but, whatever be the amount of the additional value, he is not entitled to any compensation whatever. This again is a matter which the parties may, if they please, regulate for themselves.

The law as to Ejectment is dealt with under that heading.

Statutory Provisions.—Reference may be made, in conclusion, to a few modern enactments having some bearing on the tenancy. The Agricultural Holdings Act 1908 (which repeals the Agricultural Holdings Acts of 1883, 1900 and 1906) gives to the agricultural tenant a right to compensation for (i) defects in the premises, (ii) improvements made by the landlord, (iii) improvements made by the tenant, and (iv) certain other classes of improvements although the landlord’s consent has not been obtained. As examples of (i)—may be mentioned—eruption or enlargement of buildings, laying down of permanent pasturage to meadow; covenants, as respects of buildings, as respects of (ii)—chalking of land, clay burning, application to land of purchased artificial or purchased manure, except that they have been made for the purpose of making provision to protect the holding from injury or deterioration; and in the case of slight damage whenever it is not in writing must be given to the landlord, who may then execute the improvements himself and charge the tenant with interest not exceeding 5% per annum on the amount; such interest, where the tenant pays rent for a period of twenty-five years, and recoverable as rent, will repay the outlay, with interest at the rate of 3% a year. Under s. 11 of the act a tenant is entitled to compensation for disturbance, and where he is compelled to quit without good and sufficient cause, and for nothing inconsistent with good estate management. An agricultural tenancy may not contract himself out of his statutory right to compensation, but “contracting out” is apparently not prohibited with regard to the right given by the Landlord and Tenant Act 1891 and 1905 as regards crops and from any year from year till notice is given by one party. This right is to be transmitted by (i) by the rental, assigned to the landlord, and followed by possession on the part of the assignee; (ii) by sale—subject to the effect of which is equivalent to that of under-lease in English law; (iii) by succession, as of the heir of a tenant; (iv) in the case of agricultural holdings, by bequest (Agricultural Holdings [Scotland] Act 1883, s. 29). A lease terminates (i) by the expiration of its term or by assignment being taken by the party in whose favour it is entered, or by the death of a tenant; (ii) by failure to make a payment of produce, or by destruction, e.g. by fire, of the subject leased, unless the landlord is bound to restore it. Complete destruction of the subject leased, e.g. where a house is burnt down, or a farm is reduced to ruins by fire, is held to prevent the obligation to pay rent. The effect of partial destruction has given rise to some uncertainty. "The distinction seems to be that if the
LANDLORD AND TENANT

159

not is essential. That is a matter of identification as to time only. In Pennsylvania, parol evidence of the date is allowed. The general American doctrine is that where the contract is contained in separate writings they must connect themselves by reference, and that parol evidence is not admissible to connect them. The English doctrine that a verbal lease may be specifically enforced if there has been part performance by the person seeking the remedy has been fully adopted in nearly all the American states. The law as to the rights and obligations of assignees and sub-lessees and as to surrender is the same as in England. Forfeiture only renders a lease void as regards the lessee; it may be waived by the lessor, and acceptance by the landlord of rent due after forfeiture, with notice of such forfeiture, amounts to waiver. Where there is a lease for a certain period, no notice to quit is necessary. In uncertain tenancies there must be reasonable notice—i.e. at common law six months generally. The notice necessary to determine a monthly or weekly tenancy is generally a month or a week (see further under Lodging). In the United States, as in England, the covenant for quiet enjoyment only extends, so far as relates to the acts of third parties, to lawful acts of disturbance in the enjoyment of the subject agree to be met.

Laws of Other Countries.—It is impossible here to deal with the
systems of land tenure in force in other countries. Only the question of the legal relations between landlord and tenant can be touched upon. In France, the Code Civil recognizes two such relationships, the letting to hire of houses (bail à loyer) and the letting to farm of rural properties (bail à ferme). To a certain extent, both forms of tenure are governed by the same rules. The letting may be either written or verbal. But a verbal lease presents this disadvantage that, if it is unperformed and one of the parties denies its existence, it cannot be proved by witnesses. The party who denies the letting can only be put to his oath (Arts. 1714-1715). It may further be noted that in the case of a verbal lease, notice to quit is regulated by the rules of personal rights. To the lessee a day's notice to quit is given by the landlord. A Court of law, at the instance of the landlord, resolves the case as an action of serious matter. The lessee is not entitled to re-occupy the premises unless it is the intention of the landlord. Under the law of Scotland, since 1880, a landlord had as security for rent due on an agricultural lease a "hypothec"—i.e. a preferential right over ordinary creditors, and extending, subject to certain limitations, to the whole stock and harvest of the tenant and the tenant's property. In 1908, the tenant is entitled to compensation for permanent improvements. The Scottish law has been applied in England.

Under the law of Scotland, until 1890, a landlord had as security for rent due on an agricultural lease a "hypothec"—i.e. a preferential right over ordinary creditors, and extending, subject to certain limitations, to the whole stock and harvest of the tenant and the tenant's property. In 1908, the tenant is entitled to compensation for permanent improvements. The Scottish law has been applied in England.

Ireland.—The law of landlord and tenant was originally substantially the same as that described for England is. But the modern Land Acts have re-adjusted the relation between landlords and tenants. The Acts of 1881, 1883, 1884, 1886, 1887, 1895, and the Land Purchase Acts have meanwhile established the law of landlord and tenant, and the whole system was remodelled by the Land Purchase Acts (see IRELAND).

United States.—The law of landlord and tenant in the United States is in its principles similar to those of English law. In the United States, the law of landlord and tenant is created, altered and dissolved in the same way as in England, and the duties and parties are substantially identical. A lease must contain, either in itself or by clear reference, all of the terms of a complete contract—the names of the parties, description of the property let, the rent (see RENT) and the conditions. The date
liable for injuries and losses happening by the act of persons belonging to his house or of his sub-tenants (Art. 1732). A lease terminates (i.) at the expiration of the prescribed term (Art. 1737)—if at that period the lessee remains and is left in possession, there is, in the case of written leases, a tacit renewal (locitae reconditorum) of the lease as a verbal lease (Arts. 1738-1739); (ii.) by the loss of the thing hired and by the default of the lessor or lessee in the fulfillment of their respective obligations (Art. 1741), but (iii.) not by the death either of the lessor or of the lessee (1742). The conditions of Ejectment are stated under that heading. The special rules (Arts. 1752-1762) relative to the hire of houses are touched upon in Lodger and Lodgings. It only remains here to refer to those applicable to leases to farm. The lessee is bound to stock the farm with the cattle and implements necessary for its husbandry (Art. 1766), and to stack in the places appointed for the purpose in the lease (Art. 1765). A lessee, who farms on condition of dividing the produce with the lessor, can only underlet or assign if he is expressly empowered to do so by the lease (Art. 1763). The lessee must give notice to the lessor of any acts of usurpation committed on the property (Art. 1768). If at least half of the harvest in any year is destroyed by accident, the lessee (a) in the case of a lease for several years, obtains, at the end of his lease, a refund of rent, by way of indemnity, unless he has been indemnified by preceding harvests; (b) in the case of a lease for a year only, may secure a proportional abatement of the current rent. No refund is payable if the produce was severed before the accident, unless the lessor was entitled to a portion of it, when he must bear his share of the loss, provided the lessee was not in mor at this delivery of the lessor's portion. The lessee has no right to a refund when the cause of damage was existing and known at the date of the lease (Arts. 1769-1771). Liability for loss by "accidents" may be thrown on the lessee by express stipulation (Art. 1772). "Accidents" here mean ordinary accidents only, such as hail, lightning or frost, and the lessee will not be answerable for loss caused by extraordinary accidents such as stormy winds, unless they have been made liable for all accidents, foreseen or unforeseen (Art. 1773). A verbal lease is deemed to be for the term necessary to enable the lessee to gather all the produce, thus for a year in the case of a meadow or vineyard; in the case of lands leased in tillage, where they are divided into shifts or seasons, for as many years as there are shifts (Art. 1774). The outgoing must leave for the incoming tenant convenient housing and other facilities for the labours of the year following; the incoming must procure for the outgoing tenant conveniences for the consumption of his fodder and for the harvests remaining to be got in. In either case the custom of the place is to be followed (Art. 1777). The outgoing tenant must leave the straw and manure of the year, if he received them at the beginning of his lease, and even where he has not so received them, the owner may retain them according to valuation (Art. 1778). A word must be added as to letting by cheptel (cheptel à moitié), in which the parties give to the other a stock of cattle to keep under conditions agreed on between them (Art. 1800). There are several varieties of the contract, (i.) simple cheptel (cheptel simple) in which the whole stock is supplied by the lessor—the lessee taking half the profit and bearing half the loss (Art. 1804); (ii.) cheptel by moiety (cheptel à moitié)—here each of the contracting parties furnishes half of the stock, which remains common for profit or loss (Art. 1818); (iii.) cheptel given to a farmer (fermier) or participating cultivator (colon partaire)—in the cheptel given to the farmer (also called cheptel de fer) stock of value equal to the estimated price of the stock given must be left at the expiry of the lease (Art. 1821); cheptel given to the participating cultivator resembles simple cheptel, except in points of detail (Arts. 1827-1830); (iv.) the term "cheptel" is also improperly applied to a contract by which cattle are given to be housed and fed—here the lessor retains the ownership, but has only the profit of the calves (Art. 1831)

The French system just described is in force in its entirety in Belgium (Code Civil, Arts. 1713 etc seq.) and has been followed to some extent in Italy (Civil Code, Arts. 1568 et seq.), Spain (Civil Code, Arts. 1512 et seq.), and Portugal (Civil Code, Arts. 1298 et seq., 1593 et seq.). In all these countries there are varieties of emphyteutic tenure; and in Italy the zeddrazzor or metayer system (see Civil Code, Arts. 1647 et seq.) exists. The German Civil Code adopts the distinction between bail déoyer (Michel, Arts. 535 et seq.) and bail à fermé (Pacht, Arts. 581 et seq.). Dutch law also (Civil Code, Arts. 1583 et seq.) is similar to the Italian.

The Indian law of landlord and tenant is described in the article INDIAN LAW. The laws of the various British colonies on the subject are too numerous and too different to be dealt with here. In Mauritius, the provisions of the Code Civil are in force without modification. In Quebec (Civil Code, Arts. 1605 et seq.) and St Lucia (Civil Code, Arts. 1512 et seq.) they have been reproduced by the local law. In many of the colonies, parts of the English law of landlord and tenant, common law and statutory, have been introduced by local enactments (cf. British India, Ord. No. 1846; Jamaica, 1 Vict. c. 26). In others (e.g. Victoria, Landlord and Tenant Act 1890, No. 1108; Ontario, Rev. Stats. 1897, c. 170) consolidating statutes have been passed.

LONDON, CHARLES PAUL (1760-1826), French painter and art-author, was born at Nonant in 1760. He entered the studio of Regnault, and won the first prize of the Academy in 1792. After his return from Italy, disturbed by the Revolution, he seems to have abandoned painting for letters, but he began to exhibit in 1795, and continued to do so at various intervals up to 1814. His "Leda" obtained an award of merit in 1801, and is now in the Louvre. His "Mother's Lesson," "Paul and Virginia Bathing," and "Daedalus and Icarus" have been engraved; but his works on painting and painters, which reach nearly one hundred volumes, form his chief title to be remembered. In spite of a complete want of critical accuracy, an extreme carelessness in the biographical details, and the feebleness of the line engravings by which they are illustrated, London's Annales du Musée, in 33 vols., form a vast repository of compositions by most of every age and school of permanent value. London also published Lives of Celebrated Painters, in 22 vols.; An Historical Description of Paris, 2 vols.; A Description of London, with 42 plates; and descriptions of the Luxembourg, of the Giustiniani collection, and of the gallery of the duchesse de Berry. He died at Paris in 1826.

LONDON, LETITIA ELIZABETH (1802-1838), English poet and novelist, better known by her initials L. E. L. than as Miss London or Mrs Maclean, was descended from an old Herefordshire family, and was born at Chelsea on the 14th of August 1802. She went to a school in Chelsea where Miss Mitford also received her education. Her father, an army agent, amassed a large property, which he lost by speculation shortly before his death. About 1815 the Londons made the acquaintance of William Jerdan, and Letitia began her contributions to the Literary Gazette and to various Christmas annuals. She also published some volumes of verse, which soon won for her a wide literary fame. The gentle melancholy and romantic sentiment of her writings embodied the taste of the period, and would
in any case have secured her the sympathy and approval of a wide class of readers. She displays richness of fancy and aptness of language, but her work suffered from hasty production, and has not stood the test of time. The large sums she earned by her literary labours were expended on the support of her family. An engagement to John Forster, it is said, was broken off through the intervention of scandalmongers. In June 1838 she married George Maclean, governor of the Gold Coast, but, she only survived her marriage, which proved to be very unhappy, by a few months. She died on the 15th of October 1838 at Cape Coast from an overdose of prussic acid, which, it is supposed, was taken accidentally.

For some time L. E. L. was joint editor of the Literary Gazette. Here he published a number of poems, an article on Shakespeare, and partly under the title The Fate of Adelaide, and was followed by other collections of verses with similar titles. She also wrote several novels, of which the best is Ethel Churchill (1857). Various editions of her Poetical Works have been published since her death, one in 1890 with an introductory memoir by W. B. Scott. The Life and Literary Remains of Letitia Elizabeth Landon, by Laman Blanchard, appeared in 1841, and a second edition in 1855.

LANDOR, WALTER SAVAGE (1775-1864), English writer, eldest son of Walter Landor and his wife Elizabeth Savage, was born at Warwick on the 30th of January 1775. [He was sent to Rugby school, but was removed at the headmaster's request and studied privately with Mr Langley, vicar of Ashbourne. In 1793 he entered Trinity College, Cambridge. He adopted religion in the way in which it was advanced at that period, was a Tory for whom he had an aversion. He was rusticated for a year, and, although the authorities were willing to condone the offence, he refused to return. The affair led to a quarrel with his father in which Landor expressed his intention of leaving home for ever. He was, however, reconciled with his family through the efforts of his friend Dorothea Lyttelton. He entered no profession, but his father allowed him £150 a year, and he was free to live at home or not as he pleased.]

In 1795 appeared in a small volume, divided into three books, The Poems of Walter Savage Landor, and, in pamphlet form of nineteen pages, an anonymous Moral Epistle, respectfully dedicated to Earl Stanhope. No poet at the age of twenty ever had more vigour of style and fluency of verse; nor perhaps has any ever shown such masterly command of epigram and satire, made vivid and vital by the purest enthusiasm and most generous indignation. Three years later appeared the first edition of the first great work which was to inscribe his name for ever among the great names in English poetry. The second edition of Egob appeared in 1803, with a text corrected of grave errors and improved by magnificent additions. About the same time the whole poem was also published in a Latin form, which for might and melody of line, for power and perfection of language, must always dispute the palm of precedence with the English version. [His father's death in 1805 put him in possession of an independent fortune. Landor settled in Bath. Here in 1808 he met Southey, and the mutual appreciation of two poets led to a warm friendship.] In 1808, under an impulse not less heroic than that which was afterwards to lead Byron to a glorious death in redemption of Greece and his own good fame, Landor, then aged thirty-three, left England for Spain as a volunteer to serve in the national army against Napoleon at the head of a regiment raised and supported at his sole expense. After some three months' campaigning came the affair of Cintra and its disasters; "his troop," in the words of his biographer, "dispersed or melted away, and he came back to England in as great a hurry as he had left it," but bringing with him the honourable recollection of a brave design unselfishly attempted, and the material in his memory for the sublimest poem published in our language, between the last masterpiece of Milton and the first masterpiece of Shelley—one equally worthy to stand unchallenged beside either for poetic perfection as well as moral majesty—the lofty tragedy of Conti Julian, which appeared in 1812, without the name of its author. No comparable work is to be found in English poetry between the date of Samson Agonistes and the date of Prometheus Unbound; and with both these great works it has some points of greatness in common. The superhuman isolation of agony and endurance which encircles and exalts the hero is in each case expressed with equally appropriate magnificence of effect. The style of Conti Julian, if somewhat deficient in dramatic ease and the fluency of natural dialogue, has such might and purity and majesty of speech as elsewhere we find only in Milton so long and so steadily sustained. In May 1811 Landor had suddenly married Miss Julia Thurlrier, with whose looks he had fallen in love at first sight in a ball-room at Bath; and in June they settled for a while at Llanthony Abbey in Monmouthshire, from whence he was worried in three years' time by the combined vexation of neighbours and tenants, lawyers and lords-lieutenant; not before much toil and money had been spent in raising the lowest part of the land, to relieve the wretchedness and raise the condition of the peasantry. He left England for France at first, but after a brief residence at Tours took up his abode for three years at Como; "and three more wandering years he passed," says his biographer, "between Pisa and Pistoja, before he pitched his tent in Florence in 1821."

In 1835 he had an unfortunate difference with his wife which ended in a complete separation. In 1844 appeared the first series of his Imaginary Conversations, in 1856 "the second edition, corrected and enlarged"; a supplementary third volume was added in 1828; and in 1839 the second series was given to the world. Not until 1846 was a fresh instalment added, in the interval he had published his three other most famous and greatest books in prose: The Citation and Examination of William Shakespeare (1834), Pericles and Aspasia (1836), The Pentameron (1837). To the last of these was originally appended The Pentalogia, containing five of the very finest among his shorter studies in dramatic poetry. In 1847 he published his most important Latin work, Poemata et inscriptiones, comprising, with large additions, the main contents of two former volumes of idyllic, satiric, elegiac and lyric verse; and in the same golden year of his poetic life appeared the very crown and flower of its manifold labours, the Hellene of Walter Savage Landor, enlarged and corrected. Twelve years later this book was re-issued, with additions of more or less value, with alterations generally to be regretted, and with omissions invariably to be deplored. In 1853 he put forth The Last Fruit off on Old Tree, containing fresh conversations, critical and controversial essays, miscellaneous epigrams, lyrics and occasional poems of various kind and merit, closing with Five Scenes on the martyrdom of Beatrice Cenci, unsurpassed even by their author himself for noble and heroic pathos, for subtle and genial, tragic and profound, ardent and compassionate insight into character, with consummate mastery of dramatic and spiritual truth. In 1856 he published Antony and Octavius—Scenes for the Study, twelve consecutive poems in dialogue which alone would suffice to place him high among the few great masters of historic drama.

In 1858 appeared a metrical miscellany bearing the title of Dry Sticks Fugled by W. S. Landor, and containing among other things graver and lighter certain epigrammatic and satirical attacks which reinvolved him in the troubles of an action for libel; and in July of the same year he returned for the last six years of his life to Italy, which he had left for England in 1835. [He was advised to make over his property to his family, on whom he was now dependent. They appear to have refused to make him an allowance unless he returned to England. By the exertions of Robert Browning an allowance was secured. Browning settled him first at Sienna and then at Florence.] Embittered and distracted by domestic dissensions, if brightened and relieved by the affection and veneration of friends and the peculiar beauty of his poet-and-actor and splendid career came at last to a quiet end on the 17th of September 1884. In the preceding year he had published a last volume of Heroic Idyls, with Additional Poems, English and Latin,—the better part of them well worthy to be indeed the "last fruit" of a genius which after a life of eighty-eight years had lost nothing
of its majestic and pathetic power, its exquisite and exalted loveliness.

A complete list of Landor’s writings, published or privately printed, in English, Latin and Italian, including pamphlets, fly-sheets and occasional newspaper correspondence on political or literary questions, it would be difficult to give anywhere and impossible to give here. From nineteen almost to ninety his intellectual and literary activity was indefatigably incessant; but, herein at least like Charles Lamb, whose cordial admiration he so cordially returned, he could not write a note of three lines which did not bear the mark of his “Roman hand” in its matchless and inimitable command of a style at once the most powerful and the purest of his age. The one charge which can ever seriously be brought and maintained against it is that of such occasional obscurity or difficulty as may arise from excessive strictness in condensation of phrase and expurgation of matter not always superfluous, and sometimes almost indispensable. His English prose and his Latin verse are perhaps more frequently and more gravely liable to this charge than either English verse or his Latin prose. At times it is well-nigh impossible for an eye less keen and swift, a scholarship less exquisite and ready than his own, to catch the precise direction and follow the perfect course of his rapid thought and radiant utterance. This apparently studious pursuit and preference of the most terse and elliptic expression which could be found for anything he might have to say could not but occasionally make even so sovereign a master of two great languages appear “dark with excess of light”; but from no former master of either tongue in prose or verse was ever the quality of real originality, of loose and nebulous incertitude, more utterly alien or more naturally remote. There is nothing of cloud or fog about the path on which he leads us; but we feel now and then the want of a bridge or a handrail; we have to leap from point to point of narrative or argument without the usual help of a connecting plank. Even in his dramatic works, where least of all it should have been found, the invisible connexion or sequence in details of thought or action is too often a source of sensible perplexity. In his noble trilogy on the history of Giovanna queen of Naples it is sometimes actually difficult to realize on a first reading what has happened or is happening, or how, or why, or by what agency—a defect alone sufficient, but unhappily sufficient in itself, to explain the too general ignorance of a work so rich in subtle and noble treatment of character, so sure and strong in its grasp and rendering of “high actions and high passions,” so rich in humour and in pathos, so royally serene in its commanding power upon the tragic mainsprings of terror and of pity. As a poet, he may be said on the whole to stand midway between Byron and Shelley—about as far above the former as below the latter. If we except Catullus and Simonides, it might be hard to match and it would be impossible to overmatch the flawless and blameless yet living and breathing beauty of his most perfect elegies, epigrams or odes. As truly as prettily was he likened by Leigh Hunt “to a stormy mountain pine which should produce lilies.” His passionate compassion, his bitter and burning pity for all wrongs endured in all the world, found only their natural and inevitable outlet in his lifelong defence or advocacy of tyrannicide as the last resource of baffled justice, the last discharge of heroic duty. His tender and ardent love of children, of animals and of flowers makes fragrant alike the pages of his writing and the records of his life. He was as surely the most gentle and generous as the most headstrong and hot-headed of heroes or of men. Nor ever was any man’s best work more thoroughly imbued and informed with evidence of his noblest qualities. His loyalty and liberality of heart were as inexhaustible as his bounty and beneficence of hand. Praise and encouragement, desired or undeserved, came yet more readily than his tangs or defiance. Reviled and ridiculed by Lord Byron, he retorted on the offender living less readily and less warmly than he lamented and extolled him dead. On the noble dramatic works of his brother Robert he lavished a magnificence of sympathetic praise which his utmost self-estimate would never have exacted for his own. Age and the lapse of time could neither heighten nor lessen the fulness of this rich and ready generosity. To the poets of his own and of the next generation he was not readier to do honour than to those of a later growth, and not seldom of deserts far lower and far lesser claims than theirs. That he was not unconscious of his own, and avowed it with the frank simplicity of nobler times, is not more evident or more certain than that in comparison with his friends and fellows he was liable rather to undervalue than to overrate himself. He was a classic, and no formalist; the wide range of his just and loyal admiration had room for a genius so far from classical as Blake’s. Nor in his own highest mood or method of creative as of critical work was he a classic only, in any narrow or exclusive sense of the term. On either side, immediately or hardly below his mighty masterpiece of Pericles and Aspasia, stand the two scarcely less beautiful and vivid studies of medieval Italy and Shakespearian England. The very finest flower of his immortal dialogues is probably to be found in the single volume comprising only “Imaginary Conversations of Romans,” his utmost command of passion and pathos may be tested by its transcendent success in the distilled and concentrated tragedy of Tiberius and Vipsania, where for once he shows a quality more proper to romantic than classical imagination—the subtle and sublime and terrible power to enter the dark vestibule of distraction, to throw the whole force of his fancy, the whole fire of his spirit, into the “shadowing passion” (as Shakespeare calls it) of gradually imminent insanity. Yet, if this and all other studies from ancient history or legend could be subtracted from the volume of his work, enough would be left whereon to rest the foundation of a fame which time could not sensibly impair. (A. C. S.)

LANDOUR, a hill station and sanatorium in India, in Dehra Dun district of the United Provinces, adjoining Mussoorie. Pop. (1901) 1720, rising to 3700 in the hot season. Since 1827 it has been a convalescent station for European troops, with a school for their children.

LAND REGISTRATION, a legal process connected with the transfer of landed property, comprising two forms—registration of deeds and registration of title, which may be best described as a species of machinery for assisting a purchaser or mortgagee in his inquiries as to his vendor’s or mortgagor’s title previously to completing his dealing, and for securing his own position afterwards. The consequent making inquiries into a vendor’s title before completing his purchase (or, as the case of a mortgage is precisely similar) is obvious. In the case of goods possession may ordinarily be relied on as proof of full ownership; in the case of land, the person in ostensible possession is very seldom the owner, being usually only a tenant, paying rent to someone else. Even the person to whom the rent is paid in many cases—probably, in England, in most cases—not the full owner, but only a life owner, or a trustee, whose powers of disposing of the property are of a strictly limited nature. Again, goods are very seldom the subject of a mortgage, whereas land has from time immemorial been the frequent subject of this class of transaction. Evidently, therefore, some sort of inquiry is necessary to enable a purchaser to obtain certainty that the land for which he pays full price is not subject to an unknown mortgage or charge which, if left undiscovered, might afterwards deprive him of a large part or even the whole of its value. Again, the probability of serious consequences to the purchaser ensuing from a mistake as to title is infinitely greater in the case of land than in the case of goods. Before the rightful owner can recover...
misappropriated goods, he has to find out where they are. This is usually a matter of considerable difficulty. By the time they have reached the hands of a bond fide purchaser all chance of their recovery by the true owner is practically at an end. But with land the case is far otherwise. A dispossessed rightful owner never has any difficulty in tracing his property, for it is immovable. All he has to do is bring an action for ejectment against the person in possession. For these reasons, among others, any attempt to deal with land on the simple and unsuspecting principles which obtain in regard to goods would be fraught with grave risks.

Apart from very early and primitive social conditions, there appear to be only two ways in which the required certainty as to title to land can be obtained. Either the purchaser must satisfy himself, by an exhaustive scrutiny and review of all the deeds, wills, marriages, heirships and other documents and events by which the property has been conveyed, mortgaged, leased, devised or transmitted during a considerable period of time, that no loophole exists whereby an adverse claim can enter or be made good—this is called the system of private investigation of title—or the government must act as the custodian or register of the properties within its jurisdiction, together with the names of the owners and particulars of the encumbrances in each case, and must protect purchasers and others dealing with land, on the faith of this register, from all adverse claims. This second system is called Registration of Title. To these two alternatives may perhaps be added a third, of very recent growth—Insurance of Title. This is largely used in the United States. But it is in reality only a phase of the system of private investigation. The insurance company investigates the title, and charges the purchaser a premium to cover the expense and the risk of error. Registration of deeds is an adjunct of the system of private investigation, and, except in England, is a practically invariable feature of it. It consists in the establishment of public offices in which all documents affecting land are to be recorded—partly to preserve them in a readily accessible place, partly to prevent the possibility of any material deed or document being dishonestly concealed by a vendor. Where registration is effected by depositing a full copy of the deed, it also renders the subsequent falsification of the original document dangerous. Registration of deeds does not (except perhaps to a certain extent indirectly) cheapen or simplify the process of investigation—the formalities at the registry add something to the trouble and cost incurred—but it prevents the particular classes of fraud mentioned.

The history of land registration follows, as a general rule, a fairly uniform course of development. In very early times, and in small and simple communities, the difficulty afterwards found in establishing title to land does not arise, owing to the primitive habit of attaching ceremony and publicity to all dealings. The parties meet on the land, with witnesses; symbolical acts (such as handing over a piece of earth, or the bough of a tree) are performed; and a set form of words is spoken, expressive of the intention to convey. By this means the ownership of each estate in the community becomes to a certain extent a matter of common knowledge, rendering fraud and mistake difficult. But this method leaves a good deal to be desired in point of security. Witnesses die, and memory is uncertain; and one of the earliest improvements consists in the establishment of a sort of public record kept by the magistrate, lord or other local authority, containing a series of contemporary notes of the effect of the various transactions that take place. This book becomes the general title-deed of the whole community, and as long as transactions remain simple, and not too numerous, the results appear to be satisfactory. Of this character are the Manorial Court Rolls, which were in the middle ages the great authorities on title, both in England and on the continent. The entries in them in early times were made in a very few words. The date, the names of the parties, the name or short verbal description of the land, the nature of the transaction, are all that appear. In the land registry at Vienna there is a continuous series of registers of this kind going back to 1368, in Prague to 1377, in Munich to 1440. No doubt there are extant (though in a less easily accessible form) manorial records in England of equal or greater antiquity. This may be considered the first stage in the history of Land Registration. It can hardly be said to be in active operation at the present day in any civilized country—in the sense in which that term is usually understood. Where dealings become more numerous and complicated, written instruments are required to express the intentions of the parties, and afterwards to supply evidence of the landowner's title. It appears, too, that as a general rule the public books already described continue to be used, notwithstanding this change; only (as would be expected) the entries in them, once plain and simple, either grow into full copies of the long and intricate deeds, or consist of mere notes stating that such and such deeds have been executed, leaving the persons interested to inquire for the originals, in whose custody soever they may be found. This system, which may be regarded as the second stage in the history of land registration, is called Registration of Deeds. It prevails in France, Belgium, parts of Switzerland, in Italy, Spain, India, in almost all the British colonies (except Canada) and in most of the states of the American Union, in the South American republics, in Scotland and Ireland, and in the English counties of Yorkshire and Middlesex. Where it exists, there is generally a law to the effect that in case of dispute a registered deed shall prevail over an unregistered one. The practical effect is that a purchaser can, by searching the register, find out exactly what deeds he ought to inquire for, and receives an assurance that if, after completion, he registers his own conveyance, no other deeds—even if they exist—will prevail against him.

The expenses and delays, not to mention the occasional actual losses of property through fraud or mistake, attendant on the system of making every purchaser responsible for the due examination of his vendor's title—whether or not assisted by registration of deeds—have induced several governments to establish the more perfect system of Registration of Title, which consists in collecting the transactions affecting each separate estate under a separate head, keeping an accurate account of the parcels of which each such estate is composed, and summarizing authoritatively, as each fresh transaction occurs, the subsisting rights of all parties in relation to the land itself. This system prevails in Germany, Austria, Hungary, parts of Switzerland, the Australasian colonies, nearly the whole of Canada, some of the states of the American Union, to a certain extent in Ireland, and is in course of establishment in England and Wales. The Register consists of three portions:—(1) The description of the land, usually, but not necessarily, accompanied by a reference to a map; (2) the ownership, giving the name and address of the person who can sell and dispose of the land; and (3) the encumbrances, in their order of priority, and the names of the persons for the time being entitled to them. When any fresh transaction takes place the instrument effecting it is produced, and the proper alterations in, or additions to, the register are made: if it be a sale, the name of the vendor is cancelled from the register, and that of the purchaser is entered instead; if it be a mortgage, it is added to the list of encumbrances; if a discharge, the encumbrance discharged is cancelled; if it is a sale of part of the land, the original description is modified or the plan is marked to show the piece conveyed, while a new description or plan is made and a new register is opened for the detached parcel. In the English and Australian registries a "land certificate" is also issued to the landowner containing copies of the register and of the plan. This certificate takes the place more or less of the old documents of title. On a sale, the process is as follows: The vendor first of all produces to the purchaser his land certificate, or gives him the number of his title and an authority to inspect the register. In Austria and in some colonial registries this is not necessary, the register being open to public inspection, which in England is not the case. The purchaser, on inspecting this, can easily see for himself whether the land he wishes to buy is comprised in the registered description or plan, whether the vendor's name appears on the register as the owner.
of the land, and whether there are any encumbrances or other burdens registered as affecting it. If there are encumbrances, the register states their amount and who are entitled to them. The purchaser then usually prepares a conveyance or transfer of the land, and, if the land is to be adopted to a new registry, and the vendor executes it in exchange for the purchase money. If there are mortgages, he pays them off to the persons named in the register as their owners, and they concur in a discharge. He then presents the executed instruments at the registry, and it is entered as owner of the land instead of the vendor, the mortgages, if any, being cancelled. Where "land certificates" are used (as in England and Australia), a new land certificate is issued to the purchaser showing the existing state of the register and containing a copy of the registered plan of the land. The above is only a brief outline of the processes employed. For further information as to practical details reference may be made to the treatises mentioned at the end of this article.

England and Wales.—The first attempt to introduce general registration of conveyances appears to have been made by the Statute of Enrolments, passed in the 27th year of Henry VIII. But this was soon followed by an act of evasion, and it became obsolete. A Registration Act applying to the counties of Lancaster, Chester and Durham was passed in Queen Elizabeth's reign, but failed for want of providing the necessary machinery for its observance. The principle of local registration was revived in the reign of Charles I., but these failed to pass, owing, it would seem, to the objection of landowners to publicity. In 1669 a committee of the House of Lords reported that one cause of the depreciation of landed property was the great difficulty of placing titles on the register in the first instance, and proposed registration of deeds as a remedy, but nothing was done.

During the next thirty years numerous pamphlets for and against a general registry were published. In 1704 the first Deed Registry Act was passed, applying to the West Riding of Yorkshire. In 1707 the measure was extended to the East Riding, in 1726 to Middlesex. These Middlesex and Yorkshire registries (modified considerably in practice, but not seriously in principle, by the Yorkshire Registrars Acts 1883, 1885, and Land Registry [Middlesex Deeds] Act 1891) remained in operation. They were provided for by a special act, but the security against fraud which they provide at a trifling cost. The selection of the counties seems capricious: its probable explanation is that in them trade was flourishing, and the fortunes made were frequently invested in land, and a protection against secret encumbrances was most in demand. In 1728 and 1732 Surrey and Derby petitioned, unsuccessfully, for local registries. In 1735 the North Riding Deed Registry Act was passed. In 1739 a General Registry bill passed the Commons, but did not reach the Lords. In 1742 another bill, the "Stamp Act," was passed, but it did not reach the Commons. In 1759 a General Registry bill was passed by a majority of one. In 1784 Northumberland unsuccessfully petitioned for a local registry. After this the subject was dropped in that House. The Commons passed the "Deeds Registry Bill." They reported in 1830 in favour of a general register of deeds, but though several bills were introduced, none were passed. In 1840 a committee of the House of Lords reported that the marketable value of land in the country was seriously diminished by the tedious and expensive process of the transfer of land, and that a registry of title to all real property was essential to the success of any attempt to simplify the system of conveyancing. In 1850 a Royal Commission reported in favour of a general register of deeds, and in 1851 Lord Campbell introduced a bill accordingly, but it was opposed, and was dropped. In 1853 Lord Cranworth introduced a bill, which passed the Lords but not the Commons.

Hitherto only registration of deeds had been considered, but in 1858 a Royal Commission was appointed, which reported in 1857 in favour of a register of title. The scheme they recommended was substantially embodied in a bill introduced in 1859 by Lord Cairns—then Solicitor-General—but a dissolution stopped its progress. The Commons recommenced it in 1862. It was not an act first at registration of title. This act established any landowner to register an indefeasible title on production of strict proof. The proof required to be such as the common of chancery would force an unwilling purchaser to accept. Only a few hundred titles were registered before the end of 1863. The committee of the Commons pointed to inquests into the causes of its failure. They reported in 1870, making various suggestions of detail, and especially adventuring to the great expense caused by the strictness of the official investigation. The register was extended to a number of counties.

In the same year Lord Hatherley introduced a Transfer of Land Bill, but it was not proceeded with. In 1873 Lord Selborne introduced a Land Titles and Transfer Bill, following more or less the recommendations of the report of 1870, proposing for the first time compulsory registration of title. This bill was not carried. In 1874 Lord Cairns again introduced this bill (with some modifications) in 1874, but it had to be dropped. In 1875 Lord Cairns's Land Registration Act of that year was passed, which was much the same as the former bill, but without compulsion. This act had no better success in the way of voluntary general adoption than the act of 1863. The cause was, no doubt, due in great measure to the strong opposition of the Commissioners of Revenue. It seemed at first very difficult to placate the titles on the register in the first instance. Two sorts of registration were established, "Absolute" and "Possessory." The effect of an absolute registration was immediately to destroy all previous titles and to give the purchaser a title to the land. An act was passed on a regular investigation of title, which, though not so strict as under the former act, yet necessarily involved time and cost. Possessory registration, however, was to be granted to any one who could prove a facie title—a quick and cheap process. But the effect of the act was to establish registration on a voluntary basis, and to prevent the great difficulties of placing existing adverse claims. It would only prevent new difficulties from arising. In course of time such a title would be practically as good as an absolute one. In 1885 the duke of Marlborough introduced a bill for registry of titles, and in the following vacation Lord Davey wrote three letters to The Times advocating the same thing on the general lines afterwards adopted. In 1887 Lord Halsbury, by introducing his Land Transfer Bill, commenced a practical operation. The original idea of Lord Halsbury was to produce registration by a continuous effort, resulted in the passing of his act of 1897, establishing compulsory registration of title. Lord Halsbury introduced bills in 1887, 1888 and 1889. Lord Herschell, who succeeded him after the change of government, introduced bills in 1893, 1894 and 1895. In the last of these bills the House of Lords on every occasion. The bill of 1893 reached the Commons, but was stopped by the dissolution of Parliament. In 1897 Lord Halsbury (who had returned to the woolsack) again introduced the bill. The Commons adopted the Inhabitants Law Society to withdraw its opposition in the House of Commons, and the act was finally passed on the last day of the session. Under it the Privy Council has power to issue orders in council making the registration of title compulsory on sale in a given district. The effect of such an order is to oblige every purchaser of land in the district after that date to register a "possessory title," immediately after his purchase. The compulsory provisions of the act extend to freeholds and (by a rule afterwards made) to leaseholds having forty years to run. No order except the first can be made, save on the request of a county council. The first order was made in July 1898. It embraced the whole administrative county of London (including the City of London), being gradually by groups of parishes. Under this order upwards of 122,000 titles had been registered by 1898, representing a value exceeding one hundred millions sterling.

Under the operation of this act, at the expense of a slightly increased amount of delay, all the land in the county will ultimately experience great relief in the matter both of cost and of delay. The costs of a sale (including professional assistance, if required) will ultimately be for the vendor about one-fifth, and for the purchaser (at the most usual value) less than half what it was previously. The act has thrown great weight in dealings with stock. Mortgages will also be protected from risks of fraud, which at present are very appreciable, and of which the Redgrave and Richards cases are recent examples. Further particulars relating to the practical operation of the acts will be found in the Registrar's Reports of 1902 and 1906, embracing the period from 1899 to 1905 inclusive, with comments on the general position, suggestions for future legislation, &c. In the autumn of 1908 a Royal Commission was appointed by Lord Wemyss to inquire into the working of the Land Transfer Acts. The evidence given before them in October, November and December 1908 comprised a general exposition by the registrar of the origin and history of the acts, and the principles of their working, and further evidence was taken from com- mitted by the registrar of the experience of several landowners and others, who had found the acts highly beneficial, and who had carried through a large number of dealings under absolute titles, without professional assistance, quickly, at a cost only.

Scotland.—In Scotland registration of deeds was established by an act of 1617, which remained unaltered till 1845. There are also acts of 1868 and 1874. The registry is in Edinburgh. Deeds are registered in the name of the owner of the property, each deed being indexed according to properties—each property having a separate number and folio called a "search sheet," on which all deeds affecting it are referred to. About 40,000 deeds are registered annually. The consequence of the existence of this registry is to render fraud in title absolutely unknown. Forty years is the usual period investigated.

The investigation can, if desired, be made from the records in the

---

1 In Prussia all conveyances are verbal, made in person or by attorney before the registrar, who forthwith notes them in his books.
LAND REGISTRATION

registry alone. The fees are trifling, but suffice to pay the expenses of the office, which employs between 70 and 80 permanent officers in addition to temporary assistants. The total costs of conveyancing amount, roughly speaking, to between 1 and 2½% on the purchase money. In France, the fees are payable at the rate of 114.

In 1696 a royal commission was appointed, with Lord Dunedin as chairman, to inquire into the expediency of instituting in Scotland a system of registration of title.

Avenue of examples.—These states now furnish the most conspicuous examples in the British empire of the success of registration of title. But prior to the year 1857 they had only registration of deeds, and the expense, delay, and confusion resulting from the necessity of having the property re-inquired for every change of ownership was so great that it was found impossible to carry on the agricultural pursuits of the colony. In the New York registry not many years ago 25,000 deeds were registered annually. At the same time 35,000 were registered in Middlesex. Complaints are made by American lawyers of want of uniformity and of the necessity of buying up old indexes for article by article. In 1894, there were 3,711 new receivers appointed for the purpose of splitting the indexes into "blocks," which is believed to have given much relief.

The United States.—Up to a late date the ordinary English system, with registration of deeds, was universal in the United States. The registration of title dates from the year 1861, when a system originated by the Act of Congress of that year originated.

In the New York registry not many years ago 25,000 deeds were registered annually. At the same time 35,000 were registered in Middlesex. Complaints are made by American lawyers of want of uniformity and of the necessity of buying up old indexes for article by article. In 1894, there were 3,711 new receivers appointed for the purpose of splitting the indexes into "blocks," which is believed to have given much relief.

The average time and cost of an examination of title, as estimated by a committee of the Bar Association of New York, was about thirty days and 150 dollars (about £40). The cost of registering a deed under the registration of deeds system is less,

1 Full information as to the German and Austrian systems is to be found in a Parliamentary Report of 1896 (C.—8139) on the subject.

LANDSBERG AM LECH—LANDSEER

(Melbourne, Prussia—Oberneck, Die Preussischen Grundbuchgesetze (Berlin), Austria—Das allgemeine Grundbuchgesetz, &c. (Vienna); Bartsch, Das Oesterreichische allgemeine Grundbuchgesetz zu seiner praktischen Anwendung (Vienna), Saxony—Siegmann, Sachsisches Hydroloogenrecht (Leipzig); Oesterreichische Statistik (Grundbuch-anter) (Vienna, annually). (C. F. BR.

LANDSBERG AM LECH, a town in the kingdom of Bavaria, on the river Lech, 38 m. by rail W. by S. of Munich. Pop. (1905) 6505. It has eight Roman Catholic churches, among them the Liebfrauen Kirche dating from 1408, several monasteries, and a fine medieval town-hall, with frescoes by Karl von Pilloy and a painting by Hubert von Hermker. Here also are a fine gateway, the Bayer-Tor, an agricultural and other schools. Brewing, tanning and the manufacture of agricultural machinery are the principal occupations.

See Schubert, Landsberg am Lech und Umgebung (1902); and Zweger, Geschichte Landsbergs (1886).

LANDSBERG-AN-DER-WARTHE, a town in the Prussian province of Brandenburg, at the confluence of the Warthe and the Kladow, 80 m. N.E. of Berlin by rail. Pop. (1905) 36,934. It has important engine and boiler works and iron-foundries; there are also manufactories of tobacco, cloth, caricatures, wools, spirits, jute products and leather. An active trade is carried on in wood, cattle and the produce of the surrounding country. Landberg was also formerly a cloth-making town, private No. 80, and later was besieged by the Poles and then by the Hussites.

See R. Eckert, Geschichte von Landsberg-Warthe (1890).

LANDSBERG BEI HALLE, a town in Prussia on the Strengbach, on the railway from Berlin to Weizenfelds. Pop. (1905) 1770. Its industries include quarrying and malting, and the manufacture of sugar and machinery. Landsberg was the capital of a small margraviate of this name, ruled in the 12th century by a certain Dietrich, who built the town. Later it belonged to Meissen and to Saxony, passing to Prussia in 1814.

LANDSEER, SIR EDWIN HENRY (1802–1873), English painter, third son of John Landseer, A.R.A., a well-known engraver and writer on art, was born at 71 Queen Anne Street East (afterwards 33 Foley Street), London, on March 7th 1802. His mother was Miss Potts, who sat to Sir Joshua Reynolds as the reaper with a sheaf of corn on her head, in "Macklin's Family Picture," or "The Gleaners." Edwin Henry Landseer began his artistic education under his father so successfully that in his fifth year he drew fairly well, and was familiar with animal character and passion. Drawings of his, at South Kensington, dated by his father, attest that he drew excellently at eight years of age; at ten he was an admirable draughtsman and his work shows considerable sense of humour. At thirteen he drew a majestic St Bernard dog so finely that his brother Thomas engraved and published the work. At this date (1815) he sent two pictures to the Royal Academy, and was described in the catalogue as "Master E. Landseer, 33 Foley Street." Youth forbade his being reckoned among practising artists, and caused him to be considered as the "Honorary Exhibitor" of "No. 413. Portrait of a Mule," and "No. 584. Portraits of a Pointer Pitch and Puppy." Adopting the advice of B. R. Haydon, he studied the Elgin Marbles, the animals in the Tower of London, and dissected every animal whose carcass he could obtain. In 1816 Landseer was admitted a student of the Royal Academy schools. In 1817 he sent to the Academy a portrait of "Old Bruto," a much-favoured dog, which, as well as its son, another Bruto, often appeared in his later pictures. Even at this date Landseer enjoyed considerable reputation, and had more work than he could readily perform, his renown having been zealously fostered by his father in James Elmes's "Annals of the Fine Arts." At the Academy he was a diligent student and a favourite of Henry Fuseli, who would

1 John Landseer died February 29, 1852, aged ninety-one (or eighty-three, according to Cosmo Monkhouse). Sir Edwin's eldest brother Thomas, an A.R.A., and a famous engraver, whose representations of his junior pictures have made them known throughout the world, was born in 1795, and died January 20, 1880. Charles Landseer, R.A., and Keeper of the Royal Academy, the second brother, was born in 1799, and died July 22, 1859. John Landseer's brother Henry was a painter of some reputation, who emigrated to Australia.

look about the crowded antique school and ask, "Where is my curly-headed dog-boy?" Although his pictures sold easily from the first, the prices he received at this time were comparatively small. In 1818 Landseer sent to the Society of Painters in Oil and Water Colours, which then held its exhibitions in Spring Gardens, his picture of "Fighting Dogs getting Wind." The sale of this work to Sir George Beaumont vastly enhanced the fame of the painter, who soon became "the fashion." This picture illustrates the prime strength of Landseer's earlier style. Unlike the productions of his later life, it displays not an iota of sentiment. Perfectly drawn, solidly and minutely finished, and carefully composed, its execution attested the skill acquired during ten years' studies from nature. Between 1818 and 1825 Landseer did a great deal of work, but on the whole gained little besides facility of technical expression, a greater zest for humour and a larger style. The work of this stage ended with the production of the painting called "The Cat's Paw," which was sent to the British Institution in 1824, and made an enormous sensation. The price obtained for this picture, £100, enabled Landseer to set up for himself in the house No. 1 St John's Wood Road, where he lived nearly fifty years and in which he died. During this period Landseer's principal pictures were "The Cat Disturbed;" "Alpine Mastiffs reanimating a Distressed Traveller," a famous work engraved by his father; "The Ratchatters;" "Pointers to be;" "The Larder Invaded;" and "Neptune," the head and shoulders of a Newfoundland dog. In 1824 Landseer and C. R. Leslie made a journey to the Highlands—a momentous visit for the former, who thenceforward rarely failed annually to repeat it in search of studies and subjects. In 1826 Landseer was elected an A.R.A. In 1827 appeared "The Monkey who has seen the World," a picture which marked the growth of a taste for humorous subjects in the mind of the painter that had been evoked by the success of the "Cat's Paw." "Taking a Buck" (1829) was the painter's first Scottish picture. Its execution marked a change in his style which, in increase of largeness, was a great improvement. In other respects, however, there was a decrease of solid qualities; indeed, finish, searching modelling, and elaborate draughtsmanship rarely appeared in Landseer's work after 1823. The subject, as such, soon after this time became a very distinct element in his pictures; ultimately it dominated, and in effect the artist enjoyed a greater degree of popularity than technical judgment justified, so that later criticism has put Landseer's position in art much lower than the place he once occupied. Sentiment gave new charm to his works, which had previously depended on the expression of animal passion and character, and the exhibition of noble qualities of draughtsmanship. Sentimentality ruled in not a few pictures of later dates, and quadruped is supersed by the "beauty" of the "Cat's Paw." But as many as possible of its works, and as many as possible of its more important pictures, have been included in the exhibition at the British Institution during the past quarter of a century; and the fine dog-picture "Odin" (1836)

Landseer was elected a Royal Academician in 1831. "Chevy Chase" (1826), which is at Woburn, "The Highland Whisky Still" (1829), "High Life" (1829) and "Low Life" (1829), besides other important works, had appeared in the interval. Landseer had by this time attained such amazing mastery that he painted "Spaniel and Rabbit" in two hours and a half, and "Rabbits," which was at the British Institution, in three-quarters of an hour; and the fine dog-picture "Odin" (1836)
was the work of one sitting, i.e. painted within twelve hours. But perhaps the most wonderful instance of his rapid but sure and dexterous brush-handling was "The Cavalier's Pets" (1845), the picture of two King Charles's spangles in the National Gallery, which was executed in two days. Another remarkable feat consisted in drawing, simultaneously, a stag's head with one hand and a head of a horse with the other. "Harvest in the Highlands," and that masterpiece of humour, "Jack in Office," were exhibited in 1833. In 1834 a noble work of sentiment was given to the world in "Suspense," which is now at South Kensington, and shows a dog watching at the closed door of his wounded master. Many think this to be Landseer's finest work, others prefer "The Old Shepherd's Chief Mourner" (1837). The over-praised and unfortunate "Bolton Abbey in the Olden Time," a group of portraits in character, was also shown in 1834, and was the first picture for which the painter received £400. A few years later he sold "Peace" and "War" for £1,500, and for the copyrights alone obtained £6,000. In 1838 "Man proposes, God Disposes" (1864) was resold for 6,500 guineas, and a cartoon of "The Chase" (1866) fetched 5,000 guineas. "A Distinguished Member of the Humane Society," a dog reclining on a quay wall (1838), was succeeded by "Dignity and Impudence" (1839). The "Lion Dog of Malta," and "Laying down the Law" appeared in 1840. In 1842 was finished the capital "Highland Shepherd's Home" (Sheepshanks Gift), together with the beautiful "Esos," a portrait of Prince Albert's most graceful of greyhounds, to which Thomas Landseer added an ineffable charm and solidity not in the painting. The "Rout of Comus" was painted in the summerhouse of Buckingham Palace garden in 1843. The "Challenge" was accompanied (1844) by "Shoeing the Bay Mare" (Bell Gift), and followed by "Peace" and "War," and the "Stag at Bay" (1846). "Alexander and Diogenes," and a "Random Shot," a dead kid lying in the snow, came forth in 1848. In 1850 Landseer received a national commission to paint in the Houses of Parliament three subjects connected with the chase. Although they would have been worth three times as much money, the House of Commons refused to grant £1,500 for these pictures, and the matter fell through, more to the artist's profit than the nation's gain. The famous "Monarch of the Glen" (1851) was one of these subjects. "Night" and "Morning," romantic and pathetic deer subjects, came in due order (1853). For "The Sanctuary" (1842) the Fine Arts jury of experts awarded to the artist the great gold medal of the Exposition Universelle, Paris, 1855. The "Dialogue at Waterloo" (1859), which he afterwards regarded with strong disapproval, showed how Landseer, like nearly all English artists of original power and considerable fertility, had nothing to French or Italian training. In the same year he received the honour of knighthood. Next came "Geneva" (1853), "Titania and Bottom" (1853), which comprises a charming queen of the fairies, and the "Deer Pass" (1852), followed by "The Children of the Mist" (1853), "Saved" (1856), "Braemar," a noble stag, "Rough and Ready," and "Uncle Tom and His Wife for Sale" (1857). "The Maid and the Magpie" (1858), the extraordinarily large cartoon called "Deer Browsing" (1857), "The Tw Dogs" (1858), and one or two minor paintings were equal to any previously produced by the artist. Nevertheless, signs of failing health were remarked in "Doubtful Crumbs" and "A Kind Star" (1859). The immense and profoundly dramatic picture called "A Flood in the Highlands" (1860) more than reinstated the painter before the public, but friends still saw ground for uneasiness. Extreme nervous excitability manifested itself in many ways, and in the choice (1864) of the dreamlike subject of "Man Proposes, God Disposes," bears clumsily clambering among relics of Sir John Franklin's party, there was occult pathos, which some of the artist's intimates suspected, but did not avow. In 1862 and 1863 Landseer produced nothing; but "A Piper and a Pair of Nutcrackers" (1864) revealed his old power. He declined the presidency of the Royal Academy in 1865, in succession to Sir Charles Eastlake. In 1867 the four lions which he had modelled for the base of the Nelson Monument in Trafalgar Square, London, were unveiled, and with "The Swannery invaded by Eagles" (1860) he achieved his last triumph. After four years more, full of suffering, mainly of broken art and shattered mental powers, Sir Edwin Landseer died on the 1st of October 1873, and was buried, ten days later, in St Paul's Cathedral. Those who would see the full strength of Landseer's brush should examine his sketches and the like in the Victoria and Albert Museum and similar works. In these he shows himself endowed with the strength of Paul Potter.

LAND'S END, a promontory of Cornwall, forming the westernmost point of England. It is a fine headland of granite, pierced by a natural arch, on a coast renowned for its cliff scenery. Dangerous reefs lie off the point, and one group a mile from the mainland is marked by the Longships Lighthouse, in 50° 4' N. 5° 43' W. The Land's End is the westernmost of the granite masses which rise at intervals through Cornwall from Dartmoor. The phenomenon of a raised beach may be seen here, but indications of a submerged forest have also been discovered in the neighbourhood.

LANDSHUT, a town in the kingdom of Bavaria, on the right bank of the Isar, 40 m. N.E. of Munich on the main line of railway to Regensburg. Pop. (1905) 24,217. Landshut is still a quaint, picturesque place; it consists of an old and a new town and of four suburbs, one part of it lying on an island in the Isar. It contains a fine street, the Alstadt, and several interesting medieval buildings. Among its eleven churches the most noteworthy are those of St Martin, with a tower 432 ft. high, of St Jodocus, and of the Holy Ghost, or the Hospital church, all three began before 1410. The former Dominican convent, founded in 1271, once the seat of the university, is now used as public offices. The post-office, formerly the meeting-house of the Estates, a building adorned with old frescoes; the royal palace, which contains some very fine Renaissance work; and the town-hall, built in 1446 and restored in 1860, are also noteworthy. The town has monuments to the Bavarian king, Maximilian II., and to other famous men; it contains a botanical garden and a public park. On a hill overlooking Landshut is the castle of Traunzit, called also Burg Landshut, formerly a stronghold of the dukes of Lower Bavaria, whose burial-place was at Selgenthal also near the town. The original building was erected back in the 13th century, but the chapel, the oldest part now existing, dates from the 14th century. The upper part of the castle has been made habitable. The industries of Landshut are not important; they include brewing, tanning and spinning, and the manufacture of tobacco and cloth. Market gardening and an extensive trade in grain are also carried on.

Landshut was founded about 1204, and from 1255 to 1503 it was the principal residence of the dukes of Lower Bavaria and of their successors, the dukes of Bavaria-Landshut. During the Thirty Years' War it was captured several times by the Swedes and in the 18th century by the Austrians. In April 1809 Napoleon defeated the Austrians here and the town was stormed by his troops. From 1800 to 1826 the university, formerly at Ingolstadt and now at Munich, was located at Landshut. Owing to the three helmets which form its arms the town is sometimes called "Drei helm Stadt."

Landshut belongs to the Croatianer Stad Landshut. (Landshut 1832); Wissendorf. Topographische Geschichte von Landshut (Landshut, 1858); Rosenthal. Zur Rechtsgeschichte der Stade Landshut und Straubing (Würzburg, 1883); Kalcher. Führer durch Landshut (Landshut, 1890); Hauck. Die gotische Architektur und Plastik der Stadt Landshut (Munich, 1894); and Geschichte der Stadt Landshut (Landshut, 1835).

LANDSKNECHT, a German mercenary foot-soldier of the 16th century. The name (German for "man of the plains") was given to contrast the power of these
soldiers, formed by the emperor Maximilian I. about the end of the 15th century, and the Swiss, the "men of the mountains," at that time the typical mercenary infantry of Europe. After the battles of Marignan and Pavia, where the military reputation of the Swiss had been broken, the Swabian landsknechte came to be considered the best fighting troops in Europe. Though primarily a German force and always the mainstay of imperial armies, they served in organized bodies as mercenaries elsewhere in Europe; in France they fought for the League and for the Protestants indiscriminately. In fact landsknechte, and more particularly its French corruption lansquenet, became in western Europe a general term for mercenary foot-soldiers. It is owing to the lange Spieße (long pike or lance), the typical weapon with which they were armed, that the corrupted French term, as well as a German form, landsknecht, and an English "lance-knight" came into use.

The landsknechts were raised by colonels (Oberst), to whom the emperor issued recruiting commissions corresponding to the English "indents"; they were organized in regiments made up of a colonel, lieutenant-colonel and regimental staff, with a varying number of companies, "colours" (Fähnlein), commanded by captains (Hauptmann); subaltern officers were lieutenants and ensigns (Fähnrich). In thus defining the titles and duties of each rank, and in almost every detail of regimental customs and organization, discipline and interior economy, the landsknechts may be considered as the founders of the modern military system on a regimental basis (see further ARMY).

LANDSKRONA, a seaport of Sweden, on the east side of the Sound, 15 m. N.E. of Copenhagen. Pop. (1900) 14,399. The harbour is excellent, giving a depth of 35 ft., with 15 ft. beside the quays. The town is among the first twelve manufacturing centres of Sweden in value of output, the principal industries being tanning and sugar manufacture and refining from beetroot. On the little island of Hven, immediately opposite the town, Tycho Brahe built his famous subterranean observatory of Uraniborg in the second half of the 16th century. LANDSKRONA, originally called Lądora or Landör, owed its first importance to King Erik XII., who introduced a body of Carmanian troops from Germany in 1410, and bestowed on the place the privileges of a town. During the wars of the 16th and 17th centuries it played too conspicuous a part for its own prosperity. On the 24th of July 1677 a great naval battle was fought in the neighbourhood in which the Swedes defeated the Danes.

LANDSTURM, the German equivalent of the levée en masse, or general levy of all men capable of bearing arms and not included in the other regularly organized forces, standing army or its second line formations, of Continental nations.

LANDWEHR, a German word meaning "defence of the country"; but the term as applied to an insurrectional militia is very ancient, and "lantveri" are mentioned in Balsati Capitularis, as quoted in Hallam's Middle Ages, i, 262, 10th ed. The landwehr in Prussia was first formed by a royal edict of the 17th of March 1815, which called up all men capable of bearing arms between the ages of eighteen and forty-five, and not already in the regular army, for the defence of the country. By the peace of 1815 this force was made an integral part of the Prussian army, each regiment being composed of one line and one landwehr regiment. This, however, retarded the mobilization and diminished the value of the first line, and by the re-organization of 1850 the landwehr troops were relegated to the second line. In Austria the landwehr is a totally different organization. It is in reality a cadre force existing alongside the regular army, and to it are handed over such recruits as, for want of vacancies, cannot be placed in the latter. In Switzerland the landwehr is a second line force, in which all citizens serve for twelve years, after passing twelve in the "Auszug" or field army.

LANE, EDWARD WILLIAM (1801-1876), English Arabic scholar, son of Dr Theophilus Lane, prebendary of Hereford, was born on the 17th of September 1801. He was educated at Bath and Hereford grammar schools, where he showed marked mathematical ability, and was designed for Cambridge and the church, but this purpose was abandoned, and for some time he studied the art of engraving. Failure of health compelled him to throw aside the latter and in 1831 he started for Egypt, where he spent three years, twice ascended the Nile, proceeding as far as the second cataract, and composed a complete description of Egypt, with a portfolio of one hundred and one drawings. This work was never published, but the account of the modern Egyptians, which formed a part of it, was accepted for separate publication by the Society for the Diffusion of Useful Knowledge. To perfect this work Lane again visited Egypt in 1833-1835, residing mainly in Cairo, but retiring to Luxor during the plague of 1835. Lane took up his residence in the Mahomedan quarter, and under the name of Mansur Effendi lived the life of an Egyptian scholar. He was fortunate in the time when he took up his work, for Cairo had not then become a modern city, and he was thus able to describe aspects of Arabian life that no longer exist there. Perfected by the additional observations collected during these years, the Modern Egyptians appeared in 1836, and at once took the place which it has never lost as the best description of Eastern life and an Eastern country ever written. It was followed in 1838 to 1839 by a translation of the Arabian Nights, with notes and illustrations, designed to make the book a sort of encyclopaedia of Eastern manners. The translation itself is an admirable proof of scholarship, but it is characterized by a somewhat stilted mannerism, which is not equally appropriate to all parts of the motley-coloured original. The character of some of the tales and the tedious repetitions of the same theme in the Arabic collection induced Lane to leave considerable parts of the work untranslated. The value of his version is increased by the exhaustive notes on Mahommedan life and customs. In 1840 Lane married a Greek lady. A useful volume of Selections from the Kūrān was published in 1843, but before it passed through the press Lane was again in Egypt, where he spent seven years (1842-1849) collecting materials for a great Arabic lexicon, which the munificence of Lord Prudhoe (afterwards duke of Northumberland) enabled him to undertake. The most important of the materials amassed during this sojourn (in which he was accompanied by his wife and by his sister, Mrs Poole, author of the Englishwoman in Egypt, with her two sons, afterwards well known in Eastern letters) was a copy in 24 thick quarto volumes of Sheikh Mur-taḍā's great lexicon, the Taj el 'Arāṣ, which, though itself a compilation, is so extensive and exact that it formed the main basis of Lane's subsequent work. The author, who lived in Egypt in the 18th century, used more than a hundred sources, interweaving what he learned from them with the al-Qāmis of Farīzāzāḥī in the form of a commentary. By far the larger part of this commentary was derived from the Lisān el 'Arab of Ibn Mokarram, a work of the 13th century, which Lane was also able to use while in Cairo.

Returning to England in 1849, Lane devoted the remaining twenty-seven years of his life to digesting and translating his Arabic material in the form of a great thesaurus of the lexicographical knowledge of the Arabs. In spite of weak health he continued this arduous task with unflagging diligence till a few years before his death. He died on the 10th of August 1876. Five parts appeared during his lifetime (1863-1874), and three posthumous parts were afterwards edited from his papers by S. Lane-Poole. Even in its imperfect state the Lexicon is an enduring monument, the completeness and finished scholarship with which it is executed making each article an exhaustive monograph. Two essays, the one on Arabic lexicography and the other on Arabic pronunciation, contributed to the magazine of the German Oriental Society, complete the record of Lane's publications. His scholarship was recognized by many learned European societies. He was a member of the German Oriental Society, a correspondent of the French Institute, &c. In 1853 he was awarded a small civil list pension, which was after his death continued to his widow. Lane was not an original mind; his powers were those of observation, industry and sound judgment. His personal character was elevated and pure, his strong sense of religious and moral duty being of the type that
LANE, G. M.—LANFRANC

characterized the best circles of English evangelicism in the early part of the 19th century. A Memoir, by his grand-nephew, S. Lane-Poole, was prefixed to part vi. of the Lexicon. It was published separately in 1877.

LANE, GEORGE MARTIN (1823-1879), American scholar, was born at Charlestown, Massachusetts, on the 24th of December 1823. He graduated in 1846 at Harvard, and in 1847-1851 studied at the universities of Berlin, Bonn, Heidelberg and Göttingen. In 1851 he received his doctor's degree at Göttingen for his dissertation Smyrnenaorum Res Gestae et Antiquitates, and on his return to America he was appointed University Professor of Latin in Harvard College. From 1869 until 1894, when he resigned and became professor emeritus, he was Pope Professor of Latin in the same institution. His Latin Pronunciation, which led to the rejection of the English method of Latin pronunciation in the United States, was published in 1877. He died on the 30th of June 1897. His Latin Grammar, completed and published by Professor M. H. Morgan in the following year, is of high value. Lane's assistance in the preparation of Harper's Latin lexicons was also invaluable. English light verse he wrote with humour and fluency, and his song Jonah and the Ballad of the Lone Fishball were famous.

LANE, JAMES HENRY (1814-1866), American soldier and politician, was born at Lawrenceburg, Indiana, on the 22nd of June 1814. He was the son of Amos Lane (1778-1849), a political leader in Indiana, a member of the Indiana House of Representatives in 1816-1818 (speaker in 1817-1818), in 1821-1822 and in 1830-1840, and from 1833 to 1837 a Democratic representative in Congress. The son received a common school education, studied law and in 1840 was admitted to the bar. In the Mexican War he served as a colonel under General Taylor, and then commanded the Fifth Indiana regiment (which he had raised) in the South. The Campaign under General Scott. Lane was lieutenant-governor of Indiana from 1849 to 1853, and from 1853 to 1855 was a Democratic representative in Congress. His vote in favour of the Kansas-Nebraska Bill ruined his political future in his own state, and he emigrated in 1855 to the Territory of Kansas, probably as an agent of Stephen A. Douglas to organize the Democratic party there. He soon joined the Free State forces, however, was a member of the first general Free State convention at Big Springs in September 1855, and wrote its "platform," which deprecated abolitionism and urged the exclusion of negroes from the Territory; and he presided over the Topeka Constitutional Convention, composed of Free State men, in the autumn of 1855. Lane was second in command of the forces in Lawrence during the Wakarusa War; and in the spring of 1856 he led a united expedition to the Topeka Constitution, the validity of which, however, and therefore the validity of his election, Congress refused to recognize. In May 1856, with George Washington Deitzler (1826-1884), Dr Charles Robinson, and other Free State leaders, he was indicted for treason; but he escaped from Kansas, made a tour of the northern cities, and by his fiery oratory aroused great enthusiasm in behalf of the Free State movement in Kansas. Returning to the Territory with John Brown in August 1856, he took an active part in the domestic feuds of 1856-1857. After Kansas became a state, Lane was elected in 1861 to the United States Senate as a Republican. Immediately on reaching Washington he organized a company to guard the President; and in August 1861, having gained the ear of the Federal authorities and become intimate with President Lincoln, he went to Kansas with vague military powers, and exercised them in spite of the protests of the governor and the regular departmental commanders. During the autumn, with a brigade of 1500 men, he conducted a devastating campaign on the Missouri border, and in July 1862 he was appointed commissioner of recruiting for Kansas, a position in which he rendered faithful service, though he frequently came into conflict with the state authorities. At this time he planned a chimerical "great Southern expedition" against New Mexico, but this came to nothing. In 1864 he laboured earnestly for the re-election of Lincoln. When President Johnson quarrelled with the Radical Republicans, Lane deserted the latter and defended the Executive. Angered by his defection, certain senators accused him of being implicated in Indian contracts of a fraudulent character; and in a fit of depression following this accusation he took his own life, dying near Fort Leavenworth, Kansas, on the 11th of July 1865, ten days after he had shot himself in the head. Ambitious, unscrupulous, rash and impulsive, and generally regarded by his contemporaries as an unsafe leader, Lane was a man of great energy and personal magnetism, and possessed oratorical powers of a high order.

See the article by L. W. Spring entitled "The Career of a Kansas Politician," in vol. iv. (October 1898) of the American Historical Review. Lane's papers are in the collection of the Library of Congress.

LANESSAN, JEAN MARIE ANTOINE DE (1843—), French statesman and naturalist, was born at Saint-André-de-Cubzac (Gironde) on the 13th of July 1843. He entered the navy in 1862, serving on the East African and Cochinchina stations in the medical department until the Franco-German War, when he resigned and volunteered for the army medical service. He now completed his studies, taking his doctorate in 1872. Elected to the Municipal Council of Paris in 1879, he declared in favour of communal autonomy and joined with Henri Rochefort in demanding the erection of a monument to the Communards; but after his election to the Chamber of Deputies for the 5th arrondissement of Paris in 1881 he gradually veered from the extreme Radical party to the Republican Union, and identified himself with the cause of colonial expansion. A government mission to the French colonies in 1886-1887, in connexion with the approaching Paris exhibition, gave him the opportunity of studying colonial questions, on which, after his return, he published three works: La Tunisie (Paris, 1887); L'Expansion coloniale de la France (ib., 1888), L'Indo-Chine française (ib., 1889). In 1891 he was made civil and military governor of French Indo-China, where his administration, which involved him in open rupture with Admiral Fournier, was severely criticized. Nevertheless he consolidated French influence in Annam and Cambodia, and secured a large accession of territory on the Mekong river from the kingdom of Siam. He was recalled in 1894, and published an apology for his pacifism in (1895). In 1896 he served as President of the Continental Congress the following year. In the Waldeck-Rousseau cabinet of 1899 to 1902 he was minister of marine, and in 1901 he secured the passage of a naval programme intended to raise the French navy during the next six years to a level befitting the place of France among the great powers. At the general election of 1906 he was not re-elected. He was political director of the Sûdal, and president of the French Colonial Society, and wrote, besides the books already mentioned, various works on political and biological questions.

LANFRANC (d. 1086), archbishop of Canterbury, was a Lombard by extraction. He was born in the early years of the 11th century at Pavia, where his father, Hambold, held the rank of a magistrate. Lanfranc was trained in the legal studies for which northern Italy was then becoming famous, and there he acquired such proficiency that tradition links him with Irnerius of Bologna, a pioneer in the renaissance of Roman law. Though designed for a public career Lanfranc had the tastes of a student. After his father's death he crossed the Alps to find a school in France; but in a short while he decided that Normandy would afford him a better field. About 1039 he became the master of the cathedral school at Avranches, where he taught for three years with conspicuous success. But in 1042 he embraced the monastic profession in the newly founded house of Bec. Until 1045 he lived at Bec in absolute seclusion. He was then persuaded by Abbot Herluin to open a school in the
monastery. From the first he was celebrated (totius Latinitatis magister). His pupils were drawn not only from France and Normandy, but also from Gascogne, Flanders, Germany, and Italy. Many of them afterwards attained high positions in the Church; one, Anselm of Badagio, became pope under the title of Alexander II. In this way Lanfranc set the seal of intellectual activity on the reform movement of which Bec was the centre. The favourite subjects of his lectures were logic and dogmatic theology. He was therefore naturally invited to defend the doctrine of transubstantiation against the attacks of Berengar of Tours. He took up the task with the greatest zeal, although Berengar had been his personal friend; he was the protagonist of orthodoxy at the councils of Vercelli (1050), Tours (1054) and Rome (1059). To his influence we may attribute the desertion of Berengar's cause by Hildebrand and the more broad-minded of the cardinals. Our knowledge of Lanfranc's polemics is chiefly derived from the tract De corpore et sanguine Domini which he wrote many years later (after 1079) when Berengar had been finally condemned. Though betraying no signs of metaphysical ability, his work was regarded as conclusive and became a text-book in the schools. It is the most important of the works attributed to Lanfranc; which, considering his reputation, are slight and disappointing.

In the midst of his scholastic and controversial activities Lanfranc became a political force. While merely a prior of Bec he led the opposition to the unnatural marriage of Duke William with Matilda of Flanders (1053) and carried matters so far that he incurred a sentence of exile. But the quarrel was settled when he was on the point of departure, and he undertook the difficult task of obtaining the pope's approval of the marriage. In this he was successful at the same council which witnessed his third victory over Berengar (1059), and he thus acquired a lasting claim on William's gratitude. In 1066 he became the first abbot of St Stephen's at Caen, a house which the duke had been enjoined to found as a penance for his disobedience to the Holy See. Henceforward Lanfranc exercised a perceptible influence on his master's policy. William adopted the Cluniac programme of ecclesiastical reform, and obtained the support of Rome for his English expedition by assuming the attitude of a crusader against schism and corruption. It was Alexander II., the former pupil of Lanfranc, who gave the Norman Conquest the papal benediction—a notable advantage to William at the moment, but subsequently the cause of serious embarrassments.

Naturally, when the see of Rouen next fell vacant (1067), the thoughts of the electors turned to Lanfranc. But he declined the nomination, and was nominated to the English primatecy as soon as Stigand had been canonically deposed (1070). The new archbishop at once began a policy of reorganization and reform. His first difficulties were with Thomas of Bayeux, archbishop-elect of York, who asserted that his see was independent of Canterbury and claimed jurisdiction over the greater part of midland England. Lanfranc, during a visit which he paid the pope for the purpose of receiving his pallium, obtained an order from Alexander that the disputed points should be settled by a council of the English Church. This was held at Winchester in 1072. Thanks to a skilful use of forged documents, the primate carried the council's verdict upon every point. Even if he were not the author of the forgeries he can scarcely have been the dupe of his own partisans. But the political dangers to be apprehended from the disruption of the English Church were sufficiently serious to palliate the fraud. This was not the only occasion on which Lanfranc allowed his judgment to be warped by considerations of expediency. Although the school of Bec was firmly attached to the doctrine of papal sovereignty, he still assisted William in maintaining the independence of the English Church; and appears at one time to have favoured the idea of maintaining a neutral attitude on the subject of the quarrels between papacy and empire. In the domestic affairs of England the archbishop showed more spiritual zeal. His grand aim was to extricate the Church from the fetters of the state and of secular interests. He was a generous patron of monasticism. He endeavoured to enforce celibacy upon the secular clergy. He obtained the king's permission to deal with the affairs of the Church in synods which met apart from the Great Council, and were exclusively composed of ecclesiastics. Nor can we doubt that it was his influence which shaped the famous ordinance separating the ecclesiastical from the secular courts (c. 1076). But even in such questions he allowed some weight to political considerations and the wishes of his sovereign. He acknowledged the royal right to veto the legislation of national synods. In the cases of Odo of Bayeux (1082) and of William of St Calais, bishop of Durham (1088), he used his legal ingenuity to justify the trial of bishops before a lay tribunal. He accelerated the process of substituting Normans for Englishmen in all preloments of importance; and although his nominees were usually respectable, it cannot be said that all of them were better than the men whom they superseded. For this admixture of secular with spiritual aims there was considerable excuse. By long tradition the primacy was entitled to a leading position in the king's councils; and the interests of the Church demanded that Lanfranc should use his power in a manner not displeasing to the king. On several occasions when William I. was absent from England Lanfranc acted as his vicegerent; he then had opportunities of realizing the close connexion between religious and secular affairs.

Lanfranc's greatest political service to the Conqueror was rendered in 1075, when he detected and foiled the conspiracy which had been hatched by the earls of Norfolk and Hereford. But this was not the only occasion on which he turned to good account his influence with the native English. Although he regarded them as an inferior race he was just and honourable towards their leaders. He interceded for Walthoe's life and to the last spoke of the earl as an innocent sufferer for the crimes of others; he lived on terms of friendship with Bishop Wulfstan. On the death of the Conqueror (1087) he secured the succession for William Rufus, in spite of the discontent of the Anglo-Norman baronage; and in 1088 he exhortations induced the English to fight on the side of the new sovereign against Odo of Bayeux and the other partisans of Duke Robert. He exacted promises of just government from Rufus, and was not afraid to remonstrate when the promises were disregarded. So long as he lived he was a check upon the worst propensities of the king's administration. But his restraining hand was too soon removed. In 1089 he was stricken with fever and he died on the 24th of May amidst universal lamentations. Notwithstanding some obvious moral and intellectual defects, he was the most eminent and the most disinterested of those who had co-operated with William I. in riveting Norman rule upon the English Church and people. As a statesman he did something to uphold the traditional ideal of his office; as a primate he elevated the standards of clerical discipline and education. Conceived in the Hildebrandine spirit, his reforms led by a natural sequence to strained relations between Church and State; the equilibrium which he established was unstable, and depended too much upon his personal influence with the Conqueror. But of all the Hildebrandine statesmen who applied their teacher's ideas within the sphere of a particular national church he was the most successful.

The chief authority is the Vita Lanfranci by Milo Crispin, who was precentor at Bec and died in 1149. Milo drew largely upon the Vita Herlomin, composed by Gilbert Crispin, abbot of Westminster. The Chronicon Baccislaus abbatiae, a 14th-century work, should also be consulted. These two sources, and of Lanfranc's writings, is that of L. d'Archey, Beati Lanfranci operum omnia (Paris, 1648). Another edition, slightly enlarged, is that of J. A. Giles, Lanfranci opera (2 vols., Oxford, 1844). The correspondence between Lanfranc and Gregory VII. is given in the Monumenta Gregoriana (suppl. 3, 1865). Of modern works A. Charma's Lanfranc (Paris, 1849), H. Boehmer's Die Fälschungen Erzbischof Lanfranks von Canterbury (Leipzig, 1902), and the same author's Kirche und Staat in England und in der Normandie (Leipzig, 1899) are useful. See also the authorities cited in the articles on William I. and William II. (H. W. C. D.)

LANFREY, PIERRE (1828–1877), French historian and politician, was born at Chambéry (Savoie) on the 26th of October
LANG, A.—LANG, K. H. VON

171

1828. His father had been one of Napoleon's officers. The son studied philosophy and history in Paris and wrote historical works of an anti-clerical and rationalizing tendency. These included *L'Église et les philosophes ou XVIIe siècle* (1835; new edition, with a notice of the author by E. de Pressensé, 1870); *Essai sur la révolution française* (1838); *Histoire politique des papes* (1860); *Lettres d'Éverard* (1860), a novel in the form of letters; *Le Rétablissement de la Pologne* (1863). His *magnum opus* was his *Histoire de Napoléon I* (5 vols., 1867-1875 and 1886; Eng. trans., 4 vols., 1871-1879), which ceased unfortunately at the end of 1871 with the preparations for the Russian campaign of 1872. This book, based on the emperor's correspondence published in 1838-1870, attempted the destruction of the legends which had grown up around his subject, and sought by a critical examination of the documents to explain the motives of his policy. In his desire to controvert current misconceptions and exaggerations of Napoleon's abilities Lanfrey unduly minimized his military and administrative genius. A staunch republican, he was elected to the National Assembly in 1871, became ambassador at Bern (1871-1873), and life senator in 1875. He died at Pau on the 15th of November 1877.

His *Oeuvres complètes* were published in 12 vols. (1879 seq.), and his *Correspondance* in 2 vols. (1885).

LANG, ANDREW (1844- ), British man of letters, was born on the 31st of March 1844, at Selkirk, Scotland. He was educated at the Edinburgh Academy, St Andrews University and at Balliol College, Oxford, where he took a first class in the final classical schools in 1868, becoming a fellow and subsequently honorary fellow of Merton College. As a journalist, poet, critic and historian, he soon made a reputation as one of the ablest and most versatile writers of the day. His first publication was a volume of metrical experiments, *The Ballads and Lyrics of Old France* (1872), and this was followed at intervals by other volumes of dainty verse, xxiii. *Ballads in Blue China* (1880, enlarged edition, 1888), *Ballads and Verses Vain* (1884), selected by Mr Austin Dobson; *Rhymes à la Mode* (1884), *Grass of Carnasslie* (1888), *Ban and Arrière Ban* (1894), *New Collected Rhymes* (1905). He collaborated with S. H. Butcher in a prose translation (1879) of the *Odyssey*, and with E. Myers and Walter Leaf in a prose version (1883) of the *Iliad*, both of them remarkably accurate for scholarly publication and excellence of style. As a Homeric scholar, of conservative views, he took a high rank. His *Homeric and the Epic* appeared in 1893; a new prose translation of the *Homeric Hymns* in 1899, with essays literary and mythological, in which parallels to the Greek myths are given from the traditions of savage races; and his *Homeric and his Age* in 1906. His purely journalistic activity was from the first of a varied description, ranging from sparkling "leaders" for the *Daily News* to miscellaneous articles for the *Morning Post*, and for many years he was literary editor of *Longman's Magazine*; no critic was in more request, whether for occasional articles and introductions to new editions or as editor of dainty reprints.

To the study of Scottish history Mr Lang brought a scholarly care for detail, a paucity literary style, and a gift for displacing the traditions of the Dutch. *The Mystery of Mary Stuart* (1909, new and revised ed., 1904) was a consideration of the fresh light thrown on Mary's history by the Lennox MSS. in the University library, Cambridge, strengthening her case by restating the perjury of her accusers. He also wrote monographs on *The Portraits and Jewels of Mary Stuart* (1906) and *James VI. and the Gowrie Mystery* (1902). The somewhat unfavourable view of John Knox presented in his book *John Knox and the Reformation* (1905) aroused considerable controversy. He gave new information about the continental career of the Young Pretender in *Pickle the Spy* (1897), an account of Alastair Ruadh Macdonell, whom he identified with Pickle, a notorious Hanoverian spy. This was followed in 1898 by *The Companions of Pickle*, and in 1900 by a monograph on Prince Charles Edward. In 1900 he began a *History of Scotland from the Roman Occupation*, the fourth volume of which (1907) brought Scottish history down to 1746. *The Vale's Tragedy* (1903), which takes its title from an essay on the "Man with the Iron Mask," (see Iron Mask), collects twelve papers on historical mysteries, and *A Monk of Fife* (1896) is a fictitious narrative purporting to be written by a young Scot in France in 1429-1431. Mr Lang's versatility was also shown in his valuable works on folklore and on primitive religion. The earliest of these works was *Custom and Myth* (1884); in *Myth, Literature and Religion* (2 vols., 1887, French trans., 1896) he explained the irrational elements of mythology as survivals from earlier savagery; in *The Making of Religion* (an idealization of savage animism) he maintained the existence of high spiritual ideas among savage races, and instituted comparisons between savage practices and the "occult phenomena" among civilized races; he dealt with the origins of totemism (q.v.) in *Social Origins*, printed (1903) together with J. J. Atkinson's *Primal Law*. He was one of the founders of the study of "Psychical Research," and his other writings on anthropology include *The Book of Dreams and Ghosts* (1897), *Magic and Religion* (1901) and *The Secret of the Totem* (1903). He carried the humour and sub-acidity of discrimination which marked his criticism of fellow folk-lorists into the discussion of purely literary subjects in his *Books and Bookmen* (1886), *Letters to Dead Authors* (1886), *Letters on Literature* (1886), *Blue Fairy Tale Book* (1890), beautifully produced and illustrated, was followed annually at Christmas by a book of fairy tales and romances drawn from many sources. He edited *The Poems and Songs of Robert Burns* (1896), and was responsible for *The Life and Letters* (1897) of J. G. Lockhart, and *The Life, Letters and Diaries* (1890) of Sir Stafford Northcote, first Earl of Iddesleigh.

LANG, KARL HENRICH, RITTER VON (1764-1835), German historian, was born on the 7th of June 1764 at Balglheim, near Nördlingen. From the first he was greatly attracted towards historical studies, and this was shown when he began to attend the gymnasium of Oettingen, and in 1782, when he went to the university of Altdorf, near Nuremberg. At the same time he studied jurisprudence, and in 1782 became a government clerk at Oettingen. About the same period began his activities as a journalist and publicist. But Lang did not long remain an official. He was of a restless, changeable character, which constantly involved him in personal quarrels, though he was equally quick to retire from them. In 1788 he obtained a position as private tutor in Hungary, and in 1789 became private secretary to Baron von Bühler, the envoy of Württemberg at Vienna. This led to further travels and to his entering the service of the prince of Oettingen-Wallerstein. In 1792 Lang again betook himself to a university, this time to Göttingen. Here he came under the influence of the historian, Ludwig Timotheus Spittler, from whom, as also from Johannes von Müller and Friedrich Schlegel, his historical studies received a fresh impulse. At intervals from 1793 to 1801 Lang was closely connected with the Prussian statesman Hardenberg, who employed him as his private secretary and archivist, and in 1797 he was present with Hardenberg at the congress of Rastadt as secretary to the legation. He was occupied chiefly with affairs of the principalities of Anspach and Bayreuth, newly acquired by Prussia, and especially in the settlement of disputes with Bavaria.

When in 1805 the principalities became part of Bavaria, Lang entered the Bavarian service (1806), was ennobled in 1808 and from 1810 to 1817 held the office of archivist in Munich. He again devoted himself with great enthusiasm to historical studies, which naturally dealt chiefly with Bavarian history. He evoked the theory, among other things, that the boundaries of the old counties of pögi (Gaue) were identical with those of the dioceses. This theory was combated in later days, and caused great confusion in the province of historical geography. For the rest, Lang did great service to the study of the history of Bavaria, especially by bringing fresh material from the archives to bear upon it. He also kept up his activity as a publicist, in 1814 defending in a detailed and somewhat biased pamphlet the policy of the minister Montgelas, and he undertook critical studies in the history of the Jesuits. In 1817 Lang retired from active life, and until his death, which took place on the 26th of March 1835, lived chiefly in Ansbach.
LANGDELL, CHRISTOPHER COLUMBUS (1826-1906), American jurist, was born in New Boston, Hillsborough county, New Hampshire, on the 22nd of May 1826, of English and Scotch-Irish ancestry. He studied at Phillips Exeter Academy in 1841-1848, at Harvard College in 1848-1850 and in the Hamilton Law School in 1851-1854. He practised law in New York City, but was almost unknown when, in January 1870, he was appointed Dane professor of law (and soon afterwards Dean of the Law Faculty) of Harvard University, to succeed Theophilus Parsons, to whose Treatise on the Law of Contracts (1853) he had contributed as a student. He resigned the deanship in 1895, in 1900 became Dane professor emeritus, and on the 6th of July 1906 died in Cambridge. He received the degree of LL.D. in 1875; in 1903 a chair in the law school was named in his honour; and after his death one of the school's buildings was named Langdell Hall. He made the Harvard Law School a success by remodelling its administration and by introducing the "case" system of instruction.

LANGDON, JOHN (1741-1819), American statesman, was born in Portsmouth, New Hampshire, on the 24th of June 1741. After an apprenticeship in a counting-house, he led a seafaring life for several years, and became a shipowner and merchant. In December 1774, as a militia captain he assisted in the capture of Fort William and Mary at New Castle, New Hampshire, one of the first overt acts of the American colonists against the property of the crown. He was elected to the House of Representatives of the last Royal Assembly of New Hampshire and then to the second Continental Congress in 1775, and was a member of the first Naval Committee of the latter, but he resigned in 1776, and in June 1776 became Congress's agent of prizes in New Hampshire and in 1778 continental (naval) agent of Congress in this state, where he supervised the building of John Paul Jones's "Ranger" (completed in June 1777), the "America," launched in 1782, and other vessels. He was a judge of the New Hampshire Court of Common Pleas in 1776-1779; a member (and speaker) of the New Hampshire House of Representatives from 1776 until 1782, a member of the state Constitutional Convention of 1778 and of the state Senate in 1784-1785, and in 1783-1784 was again a member of Congress. He contributed largely to raise troops in 1777 to meet Burgoyne; and he served as a captain at Bennington and at Saratoga. He was president of New Hampshire in 1785-1786 and in 1788-1789; a member of the Federal Constitutional Convention in 1787, where he voted against granting to Congress the power of issuing paper money; a member of the state convention which ratified the Federal Constitution for New Hampshire; a member of the United States Senate in 1789-1801, and its president pro tem. during the first Congress and the second session of the second Congress; a member of the New Hampshire House of Representatives in 1801-1805 and its speaker in 1803-1805; and governor of the state in 1805-1809 and in 1810-1812. He received nine electoral votes for the vice-presidency in 1808, and in 1812 was an elector on the Madison ticket. He died in Portsmouth on the 18th of September 1819. He was an able leader during the Revolutionary period, when his wealth and social position were of great assistance to the patriot party. In the later years of his life in New Hampshire he was the most prominent of the local Republican leaders and built up his party by partisan appointments. He refused the naval portfolio in Jefferson's cabinet.

His elder brother, WOODBURY LANGDON (1739-1805), was a delegate to the Continental Congress in 1777-1778, a member of the executive council of New Hampshire in 1778-1784, judge of the Supreme Court of the state in 1782 and in 1786-1790 (although he had had no legal training), and a state senator in 1784-1785.

LANDELL, F. A. (1772-1816), French actress, was born in Genoa on the 17th of September 1772, the daughter of a musician and an actress at the Comédie Italienne. She made her first appearance on the stage at Tours in 1789 and a successful début at the Comédie Française in 1788 in L’Heureuse et L’Oracle. She followed Talma and the others in 1797 to the Rue Richelieu, but returned after a few months to the Comédie Française. Here her talent and beauty gave her an enormous success in François de Neuchâteau’s Pamela, the performance of which brought upon the theatre the vials of wrath of the Committee of Safety. With the author and the other members of the caste, she was arrested and imprisoned. After the 9th Thermidor she rejoined her comrades at the Feydeau, but retired on the 16th of December 1797, reappearing only for a few performances in 1807. She had, meantime, married the son of a rich Belgian named Simons. She died in the 25th of May 1816.

LANDELL, F. A. (1813-1899), German novelist, who wrote under the pseudonym Philipp Gulen, was born at Potsdam on the 21st of December 1813. He studied medicine at Berlin (1835-1840), and on taking his degree, in 1840, entered the Prussian army as a surgeon. In this capacity he saw service in the Schleswig-Holstein campaign of 1849. He settled at Bielefeld as medical practitioner and here issued his first novel, Der Inselkönig (1852 3rd ed., 1858), which enjoyed considerable popularity. In Bielefeld he continued to work at his profession and to write, until his retirement, with the rank of Oberstabsarzt (surgeon-general) to Potsdam in 1878; there he died on the 20th of February 1899. Langdell's novels are distinguished by local colouring and pretty, though not powerful, descriptions of manners and customs. He particularly favoured scenes of English life, though he had never been in that country, and on the whole he succeeded well in his descriptions. Chief among his novels are, Der Irre von St James (1853, 5th ed., 1871), and Ermeny Glandon (3rd ed., Leip., 1863), while of those dealing with the Schleswig-Holstein campaign Andreas Barns (1856) and Die Tochter des Diplomaten (1863) commanded considerable attention.

LANDELL, FRIEDRICH ALBERT (1828-1875), German philosopher and sociologist, was born on the 28th of September 1828, at Wald, near Solingen, the son of the theologian, J. P. Lange (q.v.). He was educated at Duisburg, Zürich and Bonn, where he distinguished himself by gymnastics as much as by study. In 1852 he became schoolmaster at Cologne; in 1853 privatdozent in philosophy at Bonn; in 1858 schoolmaster...
LANGE, J. P.—LANGENBECK

173

at Duisburg, resigning when the government forbade schoolmasters to take part in political agitation. Lange then entered on a career in militant journalism in the cause of political and social reform. He was also prominent in the affairs of his town, yet found leisure to write most of his best-known books, Die Lebenslektionen (1863), Die Arbeiterfrage (1865, 5th ed. 1874), Geschichte des Materialismus (1876; 7th ed. with biographical sketch by E. C. Cohen, 1877), and J. S. Mill’s Ansichten über die praktische Frage (1866). In 1866, discouraged by affairs in Germany, he moved to Winterthur, near Zürich, to become connected with the democratic newspaper, Winterhüter Landbote. In 1869 he was Privatdozent at Zürich, and next year professor. The strong French sympathies of the Swiss in the Franco-German war led to his speedy resignation. Thenceforward he gave up politics. In 1872 he accepted a professorship at Marburg. Unhappily, his vigorous frame was already stricken with disease, and, after lingering illness, he died at Marburg, on the 23rd of November 1875, diligent to the end.

His Logische Studien was published by H. Cohen in 1877 (2nd ed., 1894). His main work, the Geschichte des Materialismus, which is brilliantly written, with wide scientific knowledge and more sympathy with English thought than is usual in Germany, is rather a didactic exposition of principles than a history in the proper sense. Adopting the Kantian standpoint that we can know nothing but phenomena, Lange maintains that neither materialism nor any other metaphysical system has a valid claim to ultimate truth. For empirical phenomenal knowledge, however, which is all that man can look for, materialism with its exact scientific methods has done most valuable service. Ideal metaphysics, though they fail the inner truth of things, have a value as the embodiment of high aspirations, in the same way as poetry and religion. In Lange’s Logische Studien, which attempts to expound the philosophy of his teacher, Schelling, that reasoning has validity so far as it can be represented in terms of space. His Arbeiterfrage advocates an ill-defined form of socialism. It protests against contemporary industrial selfishness, and against the organization of industry on the Darwinian principle of struggle for existence.

LANGE, JOHANN PETER (1802-1884), German Protestant theologian, was of peasant origin and was born at Sonneborn on the 4th of March 1802. He studied theology at Bonn (from 1822) under K. I. Nitzsch and G. C. F. Lücke, held several pastorates, and eventually (1854) settled at Bonn as professor of theology in succession to Isaac A. Dornier, becoming also in 1860 counsellor to the consistory. He died on the 9th of July 1884. Lange has been called the poetical theologian par excellence: “It has been said of him that his thoughts succeed each other in such rapid and agitated waves that all calm reflection and all rational distinction become, in a manner, drowned” (F. Lichtenberger). As a dogmatic writer he belonged to the school of Schleiermacher. His Christliche Dogmatik (3 vols., 1839-1852; new edition, 1870) “contains many fruitful and suggestive thoughts, which, however, are hidden under such a mass of bold figures and strange fancies, and suffer so much from want of clearness of presentation, that they did not produce any lasting effect” (Otto Pielerick).

His works include Die Lebens Lehre (4 vols., 1840), Das apostolische Zeitalter (2 vols., 1853-1854), Gebräuch der theologischen Enzyklopädie (1867), Grundriss der theologischen Ethik (1879), and Grundriss der Bibelkunde (1901). In 1887 he undertook with other scholars a Theologisch-kommentatorisches Bibelwerk, to which he contributed commentaries on the first four books of the Pentateuch, Haggai, Zechariah, Malachi, Matthew, Mark, Revelation. The Bibelwerk has been translated, enlarged and revised under the general editorship of Dr Philip Schaff.

LANGENBECK, a town of west-central France in the department of Indre-et-Loire, on the right bank of the Loire, 16 m. W.S.W. of Tours by rail. Pop. (1906) town, 17,555; commune, 35,590.

Langenbeck has a church of the 11th, 12th and 13th centuries but is chiefly interesting for the possession of a large château built soon after the middle of the 15th century by Jean Bourré, minister of Louis XI. Here the marriage of Charles VIII. and Anne of Brittany took place in 1491. In the park are the ruins of a keep of late 10th-century architecture, built by Fulk Nerra, count of Anjou.

LANGEN, JOSEPH (1837-1901), German theologian, was born at Cologne on the 3rd of June 1837. He studied at Bonn, was ordained priest in 1859, was nominated professor extraordinary at the university of Bonn in 1864, and a professor in ordinary of the exegesis of the New Testament in 1867—an office which he held till his death. He was one of the able band of professors who in 1870 supported Döllinger in his resistance to the Vatican decrees, and was excommunicated with Ignaz v. Döllinger, Johann Huber, Johann Friedrich, Franz Heinrich Reusch, Joseph Hubert Reinken and others, for refusing to accept them. In 1878, in consequence of the permission given to priests to marry, he ceased to identify himself with the Old Catholic movement, although he was not reconciled with the Roman Catholic Church. Langen was more celebrated as a writer than as a speaker. His first work was an inquiry into the authorship of the Commentary on St Paul’s Epistles and the Treatise on Biblical Questions, ascribed to Ambrose and Augustine respectively. In 1868 he published an Introduction to the New Testament, a work of which a second edition was called for in 1873. He also published works on the Last Days of the Life of Jesus, on Judaism in the Time of Christ, on John of Damascus (1879) and an Examination of the Vatican Dogma in the Light of Païristic Eeexig of the New Testament. But he is chiefly famous for his History of the Church of Rome to the Pontificate of Innocent III. (4 vols., 1881-1893), a work of sound scholarship, based directly upon the authorities, the most important sources being woven carefully into the text. He also contributed largely to the Internationale theologische Zeitchrift, a review started in 1893 by the Old Catholics to promote the union of National Churches on the basis of the councils of the Undivided Church, and admitting articles in German, French and English. Among other subjects, he wrote on the School of Hierotheus, on Romish falsifications of the Greek Fathers, on Leo XIII., on Liberal Ultramontanism, on the Papal Teaching in regard to Morals, on Vincentius of-Lerins and he carried on a controversy with Professor Willibald Beyschlag, of the German Evangelical Church, on the respective merits of Protestantism and Old Catholicism regarded as a basis for teaching the Christian faith. An attack of apoplexy put an end to his activity as a writer and hastened his death, which occurred in July 1901. (J. L. K.)

LANGENBECK, BERNHARD RUDOLF KONRAD VON (1810-1887), German surgeon, was born at Horneburg on the 9th of November 1810, and received his medical education at Göttingen, where he received his doctor’s degree in 1835 with a thesis on the structure of the retina. After a visit to France and England, he returned to Göttingen as Privatdozent, and in 1842 became professor of surgery and director of the Friedrichs Hospital at Kiel. Six years later he succeeded J. F. Dieffenbach (1794-1847) as director of the Clinical Institute for Surgery and Ophthalmology at Berlin, and remained there till 1882, when failing health obliged him to retire. He died at Wiesbaden on the 30th of September 1887. Langenbeck was a bold and skilful operator, but was disinclined to resort to operation while other means afforded a prospect of success. He devoted particular attention to military surgery, and was a great authority in the treatment of gunshot wounds. Besides acting as general field-surgeon of the army in the war with Denmark in 1848, he saw active service in 1864, 1866, and again in the Franco-German campaign of 1870-71. He was in Orleans at the end of 1870, after the city had been taken by the Prussians, and was unwounded in his turn of fortune in the events of 1870-71. He had 73 wounded men with whom every public building was packed. He also utilized the opportunities for instruction that thus arose, and the “Militär-Aerztliche Gesellschaft,” which met twice a week for some months, and in the discussions of which every surgeon
in the city was invited to take part, irrespective of nationality, was mainly formed by his energy and enthusiasm. He was enrolled for his services in the Danish War of 1864.

**LANGENSALZA**, a town in the Prussian province of Saxony, on the Salza, about 20 m. N.W. from Erfurt. Pop. (1905) 12,545. Near it are the remains of the old Benedictine monastery of Homburg or Hohenburg, where the emperor Henry IV. defeated the Saxons in 1075. The manufacture of cloth is the chief industry; lace, starch, machines, cigars and chemicals are also produced, while spinning, dyeing, brewing and printing are carried on. There is a sulphur bath in the neighbourhood, situated in a pleasant park, in which there are monuments to those who fell in the war of 1866. Langensalza became a town in 1211 and was afterwards part of the electorate of Saxony. In 1815 it came into the possession of Prussia. It is remarkable in history as the scene of three battles: (1) the victory of the Prussians and English over the imperial army on the 15th of February 1761; (2) that of the Prussians over the Bavarians on the 17th of April 1813; and (3) the engagement on the 27th of June 1866 between the Prussians and the Hanoverians, in which the latter, though victorious in the field, were compelled to lay down their arms on the arrival of overwhelming Prussian reinforcements.

See Göscher, Chronik der Stadt Langensalza (Langensalza, 1818-1842); G. and H. Schütz, Chronik der Stadt Langensalza (Langensalza, 1901); and Guttler, Schweinfurth Langensalza (Langensalza, 1900).

**LANGHAM, SIMON** (d. 1376), archbishop of Canterbury and cardinal, was born at Langham in Rutland, becoming a monk in the abbey of St Peter at Westminster, and later prior and then abbot of this house. In 1360 he was made treasurer of England and in 1361 he became bishop of Ely; he was appointed chancellor of England in 1363 and was chosen archbishop of Canterbury in 1366. Perhaps the most interesting incident in his primacy was when he drove the secular clergy from their college of Canterbury Hall, Oxford, and filled their places with monks. The expelled head of the seculars was a certain John de Wiclif, who has been identified with the great reformer Wycliffe. Notwithstanding the part Langham as chancellor had taken in the anti-papal measures of 1365 and 1366 he was made a cardinal by Pope Urban V. in 1368. This step lost him the favour of Edward III., and two months later he resigned his archbishopric and went to Avignon. He was soon allowed to hold other although less exalted positions in England, and in 1374 he was elected archbishop of Canterbury for the second time; but he withdrew his claim and died at Avignon on the 22nd of July 1376. Langham's tomb is the oldest monument to an ecclesiastic in Westminster Abbey; he left the residue of his estate—a large sum of money—to the abbey, and has been called its second founder.

**LANGHOLM**, a burgh of barony and police burgh of Dumfriesshire, Scotland. Pop. (1901) 3142. It is situated on both sides of the Esk, 16 m. N.E. of Annan, the terminus of a branch line connecting with the North British railway system at Riddings Junction. The Esk is crossed by a three-arched stone bridge, uniting the old town on the left bank with the new on the right, and a suspension bridge. Eves Water, which falls into the river, is spanned by a two-arched bridge, 1 m. N. of the town. The public buildings include the town hall—a substantial edifice with a tower rising in three tiers from the body of the structure, the Telford library, and the Hope hospital for aged poor. Already famous for its plaid and blankets, the prosperity of the burgh advanced when it took up the manufacture of tweeds. Distilling, brewing, dyeing and tanning are also important industries. The Esk and Liddel being favourite fishing streams, Langholm is the headquarters of the association which protects the rights of anglers. About 1 m. to the N.W. stands Langholm Lodge, a seat of the duke of Buccleuch, and some 4 m. S.E. is Gilnockie Tower, the peel-house that belonged to Johnny Armstrong, the freebooter, who was executed by order of James V. in 1530.

**LANGHORNE, JOHN** (1735-1779), English poet and translator of Plutarch, was born at Kirby Stephen, Westmorland. He at first supported himself as a private tutor and schoolmaster, and, having taken orders, was appointed (1766) to the rectory of Blagdon, Somerset, where he died on the 1st of April 1770. His poems (originals and translations), and sentimental tales, are now forgotten, but his translation of Plutarch's Lives (1770), in which he had the co-operation of his elder brother William (1771-1772), is not yet superseded. It is far less vigorous than Sir Thomas North's version (translated from Amyot) but is free from its inaccuracies. His poems were published in 1804 by his son. J. T. Langhorn, with a memoir of the author; they will also be found in R. Anderson's Poets of Great Britain, xi. (1794) and A. Chalmers's English Poets, xvi. (1810), with memoir. Of his prose writings, The Correspondence between Theodosius and Constantia, founded on a well-known story in the Spectator (No. 164).

**LANGIEWICZ, MARYAN** (1825-1887), Polish patriot, was born at Krotosyn, in the province of Posen, on the 5th of August 1825, his father being the local doctor. Langiewicz was educated at Posen, Breslau and Prague, and was compelled to earn his daily bread by giving lectures. He subsequently entered the Prussian Landwehr and served for a year in the royal guard. In 1860 he migrated to Paris and was for a time professor in the high school founded there by Mierslawski. The same year he took part in Garibaldi's Neapolitan campaign, and was then a professor in the military school at Cuneo till the establishment was closed. In 1862 he entered into communication with the central Polish committee at Warsaw, and on the outbreak of the insurrection of the 22nd of January 1863, took the command of the armed bands. He defeated the Russians at Wachock and Slupia (February), capturing 1000 muskets and 8 cannon. This victory drew hundreds of young recruits to his standard, till at last he had 12,000 men at his disposal. On the 23rd of February he again defeated the Russians, at Maloszogora, and captured 500 muskets and 2 cannon. On the 20th of March he proclaimed himself dictator and attempted to form a regular government; but either he had insufficient organizing talent, or had not time enough to carry out his plans, and after a fresh series of engagements his army was almost annihilated at Zagoc (18th of March), whereupon he took refuge in Austrian territory and was interned at Tarnow. He was subsequently transferred to the fortress of Josephstadt, from which he was released in 1865. He then lived at Solothurn as a citizen of the Swiss Republic, and subsequently entered the Turkish service as Langie Bey. He died at Constantinople on the 11th of May 1887.

See Boleslaw Limanowski, *The National Insurrection of 1863-64* (Pol.) (Lemberg, 1900); Paolo Mazzoleni, *I Bergomesi in Polonia nel 1863* (Bergamo, 1891); W. H. Bavinik, *De Poessicae aetatis 1803, &c.* (Haarlem, 1864).

**LANGLAND, WILLIAM** (c. 1322-c. 1400), the supposed English poet, generally regarded until recently as the single author of the remarkable 14th-century poem *Piers the Plowman*. Its full title is—*The Vision of William concerning Piers the Plowman*, together with *Vita de Do-wel, Do-bet, et Do-best, secundum Vit et Resoun*; usually given in Latin as *Visio Willemi de Petro Plowman, &c.*; the whole work being sometimes briefly described as *Liber de Petro Plowman*. We know nothing of William Langland except from the supposed evidence of the MSS. of the poem and the text itself, and it will be convenient first to give a brief general description of them.

The poem exists in three forms. If we denote these by the names of A-text (or Vernon), B-text (or Crowley), and C-text (or Whitaker), we find, of the first, ten MSS., of the second fourteen, and of the third seventeen, besides seven others of a mixed type. It will be seen that we thus have abundance of authorities, and the fact that the A-text, which proves the great popularity of the poem in former times, is still in common use, shows the frequent expressions which indicate a desire for reformation in religion, it was, in the time of Edward VI., considered worthy of being printed. Three impressions of the B-text were printed by Robert Crowley in 1550; and one of these was badly reprinted by Owen Rogers in 1561. In 1813 the best MS. of the C-text was printed by Dr E. Whitaker. In 1842 Mr Thomas Wright printed an edition from an excellent

The A-text contains a prologue and 12 passus or cantos (i.-iv., the vision of the Lady Meed; v.-viii., the vision of Piers the Plowman; ix.-xii., the vision of Do-wel, Do-bet and Do-best), with 2567 lines. The B-text is much longer, containing 7242 lines, with additional passus following after xi. of A, the earlier passus being altered in various respects. The C-text, with 7387 lines, is a revision of B.

The general contents of the poem may be gathered from a brief description of the C-text. This is divided into twenty-three passus, nominally comprising four parts, called respectively Vision of a Petro Plowman, Vision of Do-wel, Vision of Do-bet and Vision of Do-best. This Do-bet signifies “do better” in modern English; the explanation of the names being that he who does a kind action does well, he who teaches others to act kindly does best, whilst he who combines both practice and theory, both doing good himself and teaching others to do the same, does best. But the visions by no means closely correspond to these descriptions; and Skeat divides the whole into a set of eleven visions, which may be thus enumerated: (1) Vision of the Field Full of Folk, of Holy Church, and of the Lady Meed (passus i.-v.); (2) Vision of the Seven Deadly Sins, and of Piers the Plowman (pass. vi.-x.); (3) Wit, Study, Clergy and Scripture (pass. xi., xii.); (4) Fortune, Nature, Recklessness and Reason (pass. xiii., xiv.); (5) Vision of Imaginative (pass. xv.); (6) Conscience, Patience and Activa-Vita (pass. xvi., xvii.); (7) Free-will and the Tree of Charity (pass. xviii., xix.); (8) Faith, Hope and Charity (pass. xx.); (9) The Triumph of Piers the Plowman, i.e. The Education, Enfeild and Restoracion of Jesus Christ (pass. xxi.); (10) The Vision of Grace (pass. xxii.); (11) The Vision of Antichrist (pass. xxiii.).

The bare outline of the C-text gives little idea of the real nature of the poem. The author's object, as Skeat describes it, was to "afford himself opportunities (of which he has amply availed himself) for describing the life and manners of the poorer classes; for inveighing against clerical abuses and the rapacity of the friars; for representing the miseries caused by the great pestilences then prevalent and by the hasty and ill-advised marriages consequent thereupon; and for denouncing lazy workmen and shamb beggars, the corruption and bribery then too common in the law courts, and all the numerous forms of falsehood which are at all time the fit subjects for satire and indignant exposure. In describing, for example, the seven deadly sins, he gives so exact a description of Glutton and Sloth that the reader feels them to be no mere abstractions, but drawn from the life; and it becomes hardly more difficult to realize Glutton than it is to realize Sir John Falstaff. The numerous allegorical personages so frequently introduced, such as Scripture, Clergy, Conscience, Patience and the like, are all mouthpieces of the author himself, uttering for the most part his own sentiments, but sometimes speaking in accordance with the character which each is supposed to represent. The theological disquisitions which are occasionally introduced are somewhat dull and tedious, but the earnestness of the author's purpose and his energy of language tend to relieve them, and there are not many passages which might have been omitted without loss. The poem is essentially one of those which improve on a second reading, and as a linguistic monument it is of very high value. Mere extracts from the poem, even if rather numerous and of some length, fail to give a fair idea of it. The whole deserves and will repay, a careful study; indeed, there are not many single works from which a student of English literature and of the English language may derive more substantial benefit.

"The metre is alliterative, and destitute of final rhyme. It is not very regular, as the author's earnestness led him to use the fittest words rather than those which merely served the purpose of rhythm. The chief rule is that, in general, the same letter or combination of letters should begin three stressed syllables in the same line, as, for example, in the line which may be modernized thus: 'Of all manner of men, the mean and the rich.' Sometimes there are but two such rhyme-letters, as: 'Might of the commons made him to reign.' Sometimes there are four, as: 'In a summer season, when soft was the sun.' There is invariably a pause, more or less distinct, in the middle of each line" (Ency. Brit., 9th ed., art. LANGLAND).

The traditional view, accepted by such great authorities as Skeat and Jusserand, that a single author—and that author Langland—was responsible for the whole poem, in all its versions, has been so recently disputed that it seems best to state it in Skeat's own words, before giving briefly the alternative view, which propounds a theory of composite authorship, denying any real existence to "William Langland." The account of the single-author theory is repeated from Professor Skeat's article in the 9th edition of this work, slightly revised by him in 1905 for this edition.

"The author's name is not quite certain, and the facts concerning his life are few and scanty. As to his Christian name we are sure, from various allusions in the poem itself, and the title Visio Willemi, &c., in many MSS.; but that we may at once reject the suggestion that his name may have been Robert. In no less than three MSS. [of the C-text; one not later than 1427] occurs the following colophon: 'Explicit visio Willemi W. de Petro Plowman.' What is here meant by W. it is difficult to conjecture; but it is just possible that it may represent Wychwood (of which more presently), or Wigornies, i.e. of Worcester. As to the surname, we find the note that 'Robert or William Langland made perse ploughman,' in a handwritting of the 15th century, on the fly-leaf of a MS. copy [of the B-text] formerly belonging to Lord Ashburnham, and now in the British Museum; and in a Dublin MS. [of the C-text] is the note [in a 15th-century hand]: "Memorandum, quod Stacye de Rokevay, pater Williemi de Langlond, qui Sanctius fuit generosus et morabatur in Shipton-under-Whickcote, tenens domini le Spenser in comitatu Oxoni, qui predictus Williulum fecit librum qui vocatur Perys Ploughman." There is no trace of any Langland family in the midland counties, while the Langley family were wardens of Wychwood forest in Oxfordshire between the years 1278 and 1302; but this consideration can hardly set aside the above statement. According to Bale, our author was born at Cleobury Mortimer, which is quite consistent with the supposed that his father may have removed from that place to Shipton in Oxfordshire, as there seems to have been a real connexion between the families in those places.

"The internal evidence concerning the author is fuller and more satisfactory. By piecing together the various hints concerning himself which the poet gives us, we may compile the following account. His name was William (and probably Langland), and he was born about 1332, perhaps at Cleobury Mortimer in Shropshire. His father, who was doubtless a franklin or farmer, and his other friends put him to school, made a 'clerk' or scholar of him, and taught him what Holy Writ meant. In 1362, at the age of about thirty, he found himself wandering upon the Malvern hills, and fell asleep beside a stream, and saw in a vision a field full of folk, i.e. this present world, and many other remarkable sights which he duly records. From this supposed circumstance he named his poem The Vision of William, though it is really a succession of visions, since he mentions several occasions on which he awoke, and afterwards again fell asleep, and he even tells us of some adventures which befell him in his waking moments. In some of these visions there is no mention of Piers the Plowman, but in others he describes himself as being the coming reformer who was to remedy all abuses, and restore the world to a right condition. It is remarkable that his conception of this reformer changes from time to time, and becomes more exalted as the poem advances. At first he is no more than a ploughman, one of the true and honest labourers who are the salt of the earth; but at last he is identified with the great reformer who has come already, the regenerator of the
world in the person of Jesus Christ; in the author's own phrase—
'Petrus est Christus.' If this be borne in mind, it will not be possible to make the mistake into which so many have fallen, of speaking of Piers the Plowman as being the author, not the subject, of the poem. The author once alludes to the nickname of Long Will bestowed upon him from his tallness of stature—just as the poet Gascoigne was familiarly called Long George. Though there is mention of the Malvern hills more than once near the beginning of the poem, it is abundantly clear that the poet lived for 'many years in Cornhill (London), with his wife Kitte and his daughter Calote.' He seems to have come to London soon after the date of the first commencement of his work, and to have long continued there. He describes himself as being a tall man, one who was loath to reverence lords or ladies or persons in gay apparel, and not deigning to say 'God save you!' to the sergeants whom he met in the street, insomuch that many people took him to be a fool. He was very poor, wore long robes, and had a shaven crown, having received the clerical tonsure. But he seems only to have taken minor orders, and earned a precarious living by singing the *placet, dirige* and seven psalms for the good of men's souls. The fact that he was married may explain why he never rose in the church. But he had another source of livelihood in his ability to write out legal documents, and he was extremely familiar with the law courts at Westminster. His leisure time must have been entirely occupied with his poem, which was essentially the work of his lifetime. He was not satisfied with rewriting it once, but he actually re-wrote it twice; and from the abundance of the MSS. which still exist we can see its development from the earliest draught (A-text), written about 1362, to its latest form (C-text), written about 1393.1

1 In 1399, just before the deposition of Richard II., appeared a poem addressed to the king, who is designated as 'Richard the Redeless,' i.e. devoid of counsel. This poem, occurring in only one MS. of the B-text in which it is incomplete, breaking off at the middle of the first paragraph, may safely be ascribed to Langland, who was then in Bristol. As he was at that time about sixty-seven years of age, we may be sure that he did not long survive the accession of Henry IV. It may here be observed that the well-known poem entitled *Pierce Ploughman's Crede*, though excellently written, is certainly an imitation by another hand; for the Pierce Ploughman of the *Crede* is very different in conception from the subject of 'William's Vision.'"

On the other hand, the view taken by Professor J. M. Manly, of Chicago, which has recently obtained increasing acceptance among scholars, is that the early popularity of the *Piers Plowman* poems has resulted in "the confusion of what is really the work of five different men," and that Langland himself is "a mythical author." The argument for the distinction in authorship rests on internal evidence, and on analysis of the style, diction, and "visualizing" quality within the different texts. Whereas Skeat, regarding the three texts as due to the same author, gives most attention to the later versions, and considers the intermediate form, as on the whole the best, Manly recognizes in A the real poet, and lays special stress on the importance of attention to the A-text, and particularly pass. i-viii. In this A-text the two first visions are regarded as by a single author of genius, but the third is assigned to a continuator who tried to imitate him, the whole conclusion of the 12th passus being, moreover, by a third author, whose name, John But, is in fact given towards the end, but in a way leading Skeat only to credit him with a few lines. The same process of analysis leads to crediting the B-text and the C-text to separate and different authors, B working over the three visions of the A-text and making additions of his own, while C again worked over the B-text. The supposed references to the original author A, introduced by B and C, are then to be taken as part of the fiction. Who were the five authors? That question is left unsolved by Manly. But, according to Professor Manly, was "double less a scriber" or "a minstrel." B, C and the continuator of A "seem to have been clerics, and, from their criticisms of monks and friars, to have been of the secular clergy." C being "a better scholar than either the continuator of A or B." A, who "exempts from his satire no order of society except monks," may have been himself a monk, but "as he exhibits no special technical knowledge or interests" he "may have been a layman." As regards Richard the Redeless, Professor Manly attributes this to another imitator; he regards identity of authorship as out of the question, in consequences of differences in style and thought, apart altogether from the conclusion as to the authorship of *Piers the Plowman*.

**LANGLEY, SAMUEL PIERPONT** (1834-1906), American physicist and astronomer, was born at Roxbury, Boston, Massachusetts, on the 22nd of August 1834. After acting for a short time as assistant in Harvard College Observatory, he was appointed assistant professor of mathematics in the U.S. Naval Academy in 1866, and in the following year became director of the Allegheny Observatory at Pittsburgh, a position which he held until his selection in 1887 as secretary of the Smithsonian Institution at Washington. His name is especially associated with two main branches of investigation—aeronautics, and the exploration of the infra-red portions of the solar spectrum. The study of the latter he took up as a result of the publication in 1871 of an energy-curve of the spectrum by S. I. Lamansky. The imperfections of the thermopile, with which he began his work, led him, about 1886, to the invention of the bolometer, an instrument of extraordinary delicacy, which has last post refined form is believed to be capable of detecting a change of temperature amounting to less than one-hundred-millionth of a degree Centigrade. Depending on the fact that the electrical conductivity of a metallic conductor is decreased by heat, it consists of two strips of platinum, arranged to form the two arms of a Wheatstone bridge; one strip being exposed to a source of radiation from which the other is shielded, the heat causes a change in the resistance of one arm, the balance of the bridge is destroyed, and a deflection is marked on the galvanometer. The platinum strips are exceedingly minute, being in some cases only $\frac{1}{100}$ in. in width, and less than one-tenth of that amount in thickness. By the aid of this instrument, Langley, working on Mount Whitney, 12,000 ft. above sea-level, discovered in 1881 an entirely unsuspected extension of the invisible infra-red rays, which he called the "new spectrum." The importance of his achievement may be judged from the fact that, while the visible spectrum includes rays having wave-lengths of from about $0.4 \mu$ to $0.76 \mu$, and no invisible heat-rays were known before 1881 having a wave-length greater than $1.8 \mu$, he detected rays having a wave-length of $5.3 \mu$. In addition, taking advantage of the accuracy with which the bolometer can determine the position of a source of heat by which it is affected, he mapped out in this infra-red spectrum over 700 dark lines or bands resembling the Fraunhofer lines of the visible spectrum, with a probable accuracy equal to that of refined astronomical observations. In aeronautics he succeeded in demonstrating the practicability of mechanical flight. He first undertook a preliminary inquiry into the principles upon which flight depended, and established at Allegheny a huge "whirling table," the revolving arm of which could be driven by a steam-engine at any circumferential speed up to 70 m. an hour. The construction of a flying machine was next attempted. The first difficulty was to make it sufficiently light in relation to the power its machinery could develop; and several machines were built in which trials were made of steam, and of compressed air and carbonic acid gas as motive agents. About 1893 a
LANGLOIS—LANGRES

satisfactory machine was ready, and a new series of troubles had to be faced, for it had to be launched at a certain initial speed, and in the face of any wind that might be blowing. To enable these conditions to be fulfilled, as well as to ensure that the machine, when it fell, should fall on water, the experiments were carried out on the Potomac river, some 30 m. below Washington. It was not till the autumn of 1894 that an efficient launching apparatus was devised, and then the wings were found not to be strong enough to bear the pressures to which they were subjected. Various other delays and mishaps followed, but ultimately, on the 6th of May 1896, a successful flight was made. On that day an aerodrome, weighing about 30 lb. and about 16 ft. in length, with wings measuring between 12 and 13 ft. from tip to tip, sustained itself in the air for 1½ minutes (the full time for which it was supplied with fuel and water), and traversed on each occasion a distance of over half a mile, falling gently into the water when the engines stopped. Later in the same year, on the 28th of November, a similar aerodrome flew about three-quarters of a mile, attaining a speed of 30 m. an hour. In 1903 he experimented with an aerodrome capable of carrying a man, but repeated accidents prevented its from being launched, and finally through lack of funds the experiments had to be abandoned without the machine ever having been free in the air (see also FLIGHT AND FLYING). Langley died on the 27th of February 1906.

LANGLOIS, HIPPOLYTE (1839— ). French general, was born at Besançon in 1839, and, after passing through the École Polytechnique, was appointed to the artillery as sub-lieutenant in 1858, attaining the rank of captain in 1866. He served in the army of Metz in the war of 1870. Eight years later he became major in 1887 lieutenant-colonel and in 1888 colonel. At this time he was appointed professor of artillery at the École de Guerre, and in this post he devoted himself to working out the tactical principles of the employment of field artillery under the new conditions of armament of which he foresaw the advent. The public reçit of his work was the great treatise L’Artillerie de campagne (1881–1892), which may still be regarded as the classic of the art. In 1894 he became general of brigade, and in 1898 general of division. For two years after this he was Commandant of the École de Guerre at the time that the modern French strategical and tactical "doctrine" was being developed and taught. He was, however, regarded as a leader as well as a theorist, and in 1901 he was selected to command the XX. Army Corps on the German frontier, popularly called the "iron" corps. In 1902 he became a member of the Conseil supérieur de la Guerre, consisting of senior generals marked out for the higher commands in war. He retired from the active list in 1904 on reaching the age limit, and devoted himself with the greatest energy to critical military literature. In 1907 he began the publication of a monthly journal of military art and history, the Revue militaire générale. The most important of his other works are Enseignements de deux guerres récentes et Conséquences tactiques du progrès de l’armement.

LANGPORT, a market town in the eastern parliamentary division of Somersetshire, England, 13½ m. E. of Taunton by the Great Western railway. Pop. (1908) 3,880. It lies on the right (east) bank of the river Parret, near the point where that river debouches from the hills on to the plain through which it flows to the Bristol Channel. The main street leads up a slope from the river to the fine Perpendicular church of All Saints. Close to this an archway crosses the road, bearing a Perpendicular building known as the hanging chapel. After serving this purpose it housed first the grammar-school (founded 1675), then the Quickett museum, named after John Thomas Quickett (1815–1861) the histologist, a native of the town, whose father was master of the school. The hanging chapel afterwards became a masonic hall. Not far distant is the church of Huish Episcopi, with one of the finest of the Perpendicular towers for which Somersetshire is noted. Langport has a considerable general and agricultural trade.

Langport (Longborth, Langeberg, Langport) owed its origin to its defensible position on a hill, and its growth to its facilities for trade on the chief river of Somerset. It occupies the site of the British town of Longborth, and was important during the Roman occupation. It was a royal borough in Saxon times, and in 1086 had 34 resident burgesses. The first charter, given by Elizabeth I, 1562, recognized that Langport was by right of great antiquity, and had enjoyed considerable privileges, being governed by a portre. It was incorporated by James I. in 1617, but the corporation was abolished in 1883. Langport was represented in parliament in 1304 and 1366. The charter of 1562 granted three annual fairs to Langport, on the 28th of June, the 11th of November and the 2nd of May. One fair only is now held, on the 3rd of September, which is a horse and cattle fair. A Saturday market was held under the grant of 1562, but in the 19th century the market day was changed to Tuesday.

LANGREO, a town of northern Spain, in the province of Oviedo, in very hilly country, on the left bank of the river Nalon, and on a branch railway from Oviedo to Labiana. Pop. (1900) 18,714. In the neighbourhood large quantities of wheat, hemp, fruit and cider are produced; and there are important coal and iron mines, foundries, and factories for the manufacture of coarse cloth.

LANGRES, a town of eastern France, capital of an arrondissement in the department of Haute-Marne, 22 m. S.S.E. of Chau mont on the eastern railway to Belfort. Pop. (1906) town, 6663; commune, 9803. Langres stands at a height of some 1350 ft. on a jutting promontory of the tableland known as the plateau de Langres, and overlooks eastward and westward respectively the valleys of the Marne and its tributary the Nonelle. From the cathedral tower and the ramparts which surround the town there is an extensive view over the valley of the Marne, the Vosges and the Côte d’Or, and in clear weather Mt Blanc (160 m. distant) is visible. The cathedral of St Mammès, for the most part in the Transitional style of the 12th century, has a west front in the Graeco-Roman style of the 18th century and a fine Renaissance chapel. The church of St Martin (13th, 15th and 16th centuries) possesses a figure of Christ of the 16th century, considered very rare. The ramparts are protected by several towers, most of which date from the 16th century. The Gallo-Roman gate, one of four entrances in the Roman period, is preserved, but is walled up. The Porte des Moulins (17th century) is the most interesting of the other gates. The town possesses a museum rich in Gallo-Roman antiquities, a picture gallery and an important library. The birth of Denis Diderot here is commemorated by a statue. Langres is the seat of a bishop and a sub-prefect, and has tribunals of first instance and of commerce, a higher ecclesiastical seminary and communal colleges for both sexes. It manufactures well-known cutlery and grind-stones. Trade is in grain and other farm-produce, live stock, wine, &c.

Langres, the ancient Andemathumum, was capital of the Langona. Under Roman rule it was at first to some extent autonomous, but was reduced to the rank of colony after the revolt of the chief Sabinus in A.D. 71. The bishopric was founded about 200 by the Romans; its holders became peers of the realm and enjoyed the temporal power in the town. In 301 the Alemanni were defeated at Langres by the Romans, but in the next century it was burnt by the Vandals and by Attila.

The "plateau of Langres" appears frequently in the military history of the 18th and 19th centuries as a dominant strategic point, though its importance as such has appealed chiefly to the advocates of fortified positions and passive defence. The modern fortifications of Langres, which serves as a second line fortress, are those of St Menge or Ligniville on high ground above the confluence of the Marne and the Neuilly brook, about 5 m. N. by W. of the town; (b) the west front, comprising Humes battery (2 m. N.W. of the town) and the modern redoubts of Pernancey, Le Fays and Noidat (the last 4 m. S.W. of the town), overlooking the deep valley of the Mouché brook (this front was attacked in the mock siege of August 1907); (c) the south front, consisting of the old fort de la Marmotte, and the modern redoubt of the town; (d) the east front, marked by Forts Montlondan and Plensoy on the north and south ends respectively of a long steep ridge, 6 m. E. of Langres, the bridges over the Marne leading to these works being commanded by Fort Peigney.
a work about half a mile east of the town; (e) Fort Dampierre, 8 m. N.E. of the town, which commands all the main approaches from the north, and completes the circle by crossing its fire with that of Fort St. Menge.

LANGTOFT, PETER (d. c. 1307), English chronicler, took his name from the village of Langtoft in Yorkshire, and was a canon of the Augustinian priory in Bridlington. His name is also given as Langoteft and Langetost. He wrote in French verse dealing with the history of England from the earliest times to the death of Edward I. in 1307. It consists of three parts and contains about 9000 rhyming verses. The earlier part of the Chronicle is taken from Geoffrey of Monmouth and other writers; for the period dealing with the reign of Edward I. Langtoft is a contemporary and valuable authority, especially for affairs in the north of England and in Scotland.

Langtoft’s Chronicle seems to have enjoyed considerable popularity in the north, and the latter part of it was translated into English by Robert Mannyng, sometimes called Robert of Brunne, about 1350. It has been edited for the Rolls Series by T. Wright (1860–1868).

See Wright’s preface, and also O. Prussner, Robert Mannyng of Brunne’s Übersetzung von Pierre de Langtoft’s Chronik und ihr Verhältnis zum Originale (Breslau, 1891).

LANGTON, JOHN (d. 1337), chancellor of England and bishop of Chichester, was a clerk in the royal chancery, and became chancellor in 1302. He obtained several ecclesiastical appointments, but owing to the resistance of Pope Boniface VIII. he failed to secure the bishopric of Ely in 1298, although he was supported by Edward I. and visited Rome to attain his end. Resigning his office as chancellor in 1302, he was chosen bishop of Chichester in 1305, and again became chancellor shortly after the accession of Edward II. in 1307. Langton was one of the “ordainers” elected in 1310, and it was probably his connexion with this body that led to his losing the office of chancellor about this time. He was, however, to take part in public affairs mediating between the king and Earl Thomas of Lancaster in 1318, and attempting to do so between Edward and his rebellious barons in 1321. He died in June or July 1337. Langton built the chapterhouse at Chichester, and was a benefactor of the university of Oxford.

LANGTON, STEPHEN (d. 1228), cardinal and archbishop of Canterbury, was the son of English parents; but the date and place of his birth are unknown. Since he became early in his career a prebendary of York, and since his brother Simon (d. 1248) was elected 1 to that see in 1215, we may suppose the family to have been of northern extraction. Stephen, however, migrated to Paris, and having graduated in that university became one of its most celebrated theologians. This was probably the time when he composed his voluminous commentaries (many of which still exist in manuscript) and divided the Bible into chapters. At Paris he also held the friendship of Lothar of Segni, the future Innocent III., which played so important a part in shaping his career. Upon becoming pope, Innocent summoned Langton to Rome, and in 1206 designated him as cardinal-priest of S. Chrysogonus. Immediately afterwards Langton was drawn into the vortex of English politics.

Archbishop Hubert Walter had died in 1205, and the election of his successor had raised thorny questions. The suffragans of Canterbury claimed a share in choosing the new primate, although that right had been exclusively reserved to the monks of Canterbury by a papal privilege; and John supported the bishops since they were prepared to give their votes for his candidate, John de Gray, bishop of Norwich. A party of the younger monks, to evade the double pressure of the king and bishops, secretly elected their sub-prior Reginald and sent him to Rome for confirmation. The plot leaked out; the Cistercian monks were induced to depose the abbot, and he too was despatched to Rome. After hearing the case Innocent

1 Pope Innocent, however, would not confirm this election, and the disappointed candidate threw himself into the contest between the English barons on the one side and King John and the pope on the other. Later Simon made peace with Henry III. and was appointed archdeacon of Canterbury; he was consecrated by Pope Gregory IX. and was sent to France on diplomatic business by Henry III.

declared both elections void; and with John’s consent ordered that a new election should be made in his presence by the representatives of the monks. The latter, having confessed that they had given John a secret pledge to elect none but the bishop of Norwich, were released from the promise by Innocent; and at his suggestion elected Stephen Langton, who was consecrated by the pope on the 17th of June 1207. On hearing the news the king banished the monks of Canterbury and lodged a protest with the pope, in which he threatened to prevent any English appeals from being brought to Rome. Innocent replied by laying England under an interdict (March 1208), and excommunicating the king (November 1209). As John still remained obstinate, the pope at length invited the French king Philip Augustus to enter England and depose him. It was this threat which forced John to sue for a reconciliation; and the first condition exacted was that he should acknowledge Langton as archbishop. During these years Langton had been a friend of Pontigny, formerly the refuge of Becket. He had addressed to the English people a dignified protest against the king’s conduct, and had at last pressed the pope to take extreme measures. But he had consistently adopted towards John as conciliatory an attitude as his duty to the church would allow, and had more than once entered upon negotiations for a peaceful compromise. Immediately after entering England (July 1213) he showed his desire for peace by absolving the king. But, unlike the pope, he gave ear to the popular cry for redress of political grievances; and persisted in associating with the baronial opposition, even after he was ordered by Innocent to excommunicate them as disturbers of the peace. Langton encouraged the barons to formulate their demands, and is said to have suggested that they should take their stand upon the charter of Henry I. It is uncertain what further share he took in drafting Magna Carta. At Runnymede he appeared as a strong supporter of the king’s side, and his influence must therefore be sought in those clauses of the Charter which differ from the original petitions of the barons. Of these the most striking is that which confirms the “liberties” of the church; and this is chiefly remarkable for its moderation.

Soon after the issue of the charter the archbishop left England to attend the Fourth Lateran Council. At the moment of his departure he was suspended by the representatives of Innocent for not enforcing the papal censures against the barons. Innocent confirmed the sentence, which remained in force for two years. During this time the archbishop resided at Rome. He was allowed to return in 1218, after the deaths of Innocent and John. From that date till his death he was a tower of strength to the royal party. Through his influence Pandulf was recalled to Rome (1221) and Honorius III. promised that no legate should be sent to reside in England during the archbishop’s lifetime. In 1222, in a synod held at Osney, he promulgated a set of Constitutions still recognized as forming a part of the law of the English Church. Beyond this little is recorded of his latter years. He died on the 9th of July 1228, and was buried in Canterbury Cathedral, where his tomb, unless tradition errs, may still be seen.

The authorities are mainly those for the reign of John. No contemporary biography has come down to us. Some letters, by Langton and others, relating to the quarrel over his election are preserved in a Calendar of Rolls (P.P.P. 102). Starting with the Rolls’ edition of Genealogia of Canterbury, vol. ii.) There are many references to him in the correspondence of Innocent III. (Migne’s Patrologia Latina, vols. ccxxv.-ccxxvii.). Of modern works see F. H. Hurter, Geschichte Papst Innocenz III. (Hamburg, 1843–1844); W. F. Hook, Lives of the Archbishops of Canterbury (London, 1860–1876), and W. Stubbe’s preface to the second volume of Walter of Coventry ("Rolls’ ed."), which dedicates special attention to Langton. The MSS. of Langton’s writings are preserved in J. B. de L. and R. Poole, ed. R. R. Poole, 1902); his Constitutions are printed in D. Wilkin’s Concilia, vol. ii. (London, 1737). (H. W. C. D.)

Another English prelate who bore the name of Langton was Thomas Langton, archbishop of Canterbury, and brother of Edward IV. In 1483 he was chosen bishop of St Davids; in 1485 he was made bishop of Salisbury and provost of Queen’s College, Oxford, and he became bishop of Winchester in 1493. In 1501 he was elected archbishop of Canterbury, but he died on the 27th of January 1501, before his election had been confirmed.
LANGTON, W.—LANGUEDOC 179

LANGTON, WALTER (d. 1321), bishop of Lichfield and treasurer of England, was probably a native of Langton West in Leicestershire. Appointed a clerk in the royal chancery, he became a favourite servant of Edward L., taking part in the suit over the succession to the Scottish throne in 1292, and visiting France more than once on diplomatic business. He obtained several ecclesiastical preferments, became treasurer in 1295, and in 1296 bishop of Lichfield. Having become unpopular, the barons in 1301 vainly asked Edward to dismiss him; about the same time he was accused of murder, adultery and simony. Suspended from his office, he went to Rome to be tried before Pope Boniface VIII., who, taking the case to Winchelsea, archbishop of Canterbury; the archbishop, although Langton's lifelong enemy, found him innocent, and this sentence was confirmed by Boniface in 1303. Throughout these difficulties, and also during a quarrel with the prince of Wales, afterwards Edward II., the treasurer was loyally supported by the king. Visiting Pope Clement V. on royal business in 1305, Langton appears to have persuaded Clement to suspend Winchelsea; after his return to England he was the chief adviser of Edward L., who had already appointed him the principal executor of his will. His position, however, was changed by the king's death in July 1307. The accession of Edward II. and the return of Langton's enemy, Piers Gaveston, were quickly followed by the arrest of the bishop and his removal from office. His lands, together with a great hoard of movable wealth, were seized, and he was accused of misappropriation and venality. In spite of the intercession of Clement V. and even of the restored archbishop, Winchelsea, who was anxious to uphold the privileges of his order, Langton, accused again by the barons in 1309, remained in prison after Edward's surrender to the " ordinaries " in 1310. He was released in January 1312 and again became treasurer; but he was disliked by the "ordinaries," who forbade him to discharge the duties of his office. Excommunicated by Winchelsea, he appealed to the pope, visited him at Avignon, and was received by Piers Gaveston, the archbishop's deputy, in May 1313. He was a member of the royal council from this time until his dismissal at the request of parliament in 1315. He died in November 1321, and was buried in Lichfield cathedral, which was improved and enriched at his expense. Langton appears to have been no relation of his contemporary, John Langton, bishop of Chichester.

LANGTRY, LILLIE (1852— ), English actress, was the daughter of the Rev. W. C. le Breton, dean of Jersey, and married in 1874 Edward Langtry (d. 1897). For many years she was famous as one of the most beautiful women in England. It was not till 1881 that she definitely went on the stage, appearing from that time under her own management both in London and in America. In 1889 she married Sir Hugo de Bathe, Bart.

LANGUAGE (adapted from the Fr. langage, from langue, tongue. Lat. lingua), the whole body of words and combinations of words as used by a people or race, for the purpose of expressing or communicating their thoughts; also, more widely, the power of expressing thought by verbal utterance. See generally under PHILOLOGY, PHONETICS, VOICE, WRITING, GRAMMAR, &c.; and the articles on the various languages, or under headings of countries and races.

LANGUEDOC, one of the old provinces of France, the name of which dates from the end of the 13th century. In 1290 it was used to refer to the country in whose tongue (langue) the word for "yes" was oc, as opposed to the centre and north of France, the langue d'oil (the oui of 10-day). Territorially Languedoc varied considerably in extent, but in general from 1360 until the French Revolution it included the territory of the following departments of modern France: part of Tarn et Garonne, Tarn, most of Haute-Garonne, Ariège, Aude, Pyrénées-Orientales, Hérault, Gard, Lozère, part of Ardèche and Hérault there. The country had no natural geographical unity. Stretching over the Cevennes into the valleys of the upper Loire on the north and into that of the upper Garonne on the west, it reached the Pyrenees on the south and the rolling hills along the Rhone on the east. Its unity was entirely political, considering none the less real, as it was the great state of the Midi, the representative of its culture and, to some degree, the defence of its peculiar civilization. Its climate, especially in Hérault (Montpellier), is especially delightful in spring and early summer, and the scenery still holds enough ruined remains of Roman and feudal times to recall the romance and the tragedy of its history.

Although the name is of comparatively late medieval origin, the history of Languedoc, which had little in common with that of northern France, begins with the Roman occupation. Toulouse was an important place as early as 119 B.C.; the next year Narbonne, the seaport, became a Roman colony. By the time of Julius Caesar the country was sufficiently Romanized to furnish him with men and money, and though at first involved in the civil wars which followed, it prospered under Roman rule as perhaps no other part of the empire did. While it corresponded exactly to no administrative division of the Roman empire, it was approximately the territory included in Gallia Narbonensis, one of the seventeen provinces into which the empire was divided at the death of Augustus. It was rich and flourishing, crowded with great and densely populated towns, Nimes, Narbonne, Béziers, Toulouse; with schools of rhetoric and poetry still vigorous in the 5th century; theatres, amphitheatres and splendid temples. In the 5th century this high culture was an open prize for the barbarians; and after the passing of the Vandals, Suebi and Visigoths into Spain, the Visigoths returned under Wallia, who made his capital at Toulouse in 419. This was the foundation of the Visigothic kingdom which Clovis dismembered in 507, leaving the Visigoths only Septimania—the country of seven cities, Narbonne, Carcassonne, Elne, Béziers, Maguelonne, Lodève and Agde—that is, very nearly the area occupied later by the province of Languedoc. At the council of Narbonne in 589 five races are mentioned as living in the province, Visigoths, Romans, Jews—of whom there were a great many among the Saracens—and the rest of the province. Charles Martel in 732 opened up the country for the Frankish conquest, which was completed by 768. Under the Carolingians Septimania became part of the kingdom of Aquitaine, but became a separate duchy in 817.

Until the opening of the 13th century there is no unity in the history of Languedoc, the great houses of Toulouse and Carcassonne and the swarm of warlike counts and barons practically ignoring the distant king of France, and maintaining a chronic state of civil war. The feudal régime did not become at all universal in the district, as it tended to become in the north of France. Alodial tenures survived in sufficient numbers to constitute a considerable class of non-vassal subjects of the king, with whose authority they were little troubled. By the end of the 11th century the house of the counts of Toulouse began to play the predominant rôle; but their court had been famous almost a century before for its love of art and literature and its extravagance in dress and fashions, all of which denote its wealth. Constance, wife of King Robert II. and daughter of the count of Toulouse, gave great offence to the monks by her following of gallant gentlemen. They owed their tastes, not only to their Roman blood, and the survival of their old love for rhetoric and poetry, but also to their intercourse with the Mahomedans, their neighbours and enemies, and their friends when they were not fighting. Under Raymond of Saint Gilles, at the end of the 12th century, the county of Toulouse began its great career, but Raymond's ambition to become an Oriental prince, which led him—and the hundred thousand men who, according to the chroniclers, followed him—away on the first crusade, left a troubled heritage to his sons Bertrand and Alphonse Jourdain. The latter successfully beat off William IX., duke of Aquitaine, and won from the count of Barcelona that part of Provence between the Drôme and the Durance. The reign of Alphonse lasted from 1109 to 1145. By the opening of the 13th century the sovereignty of the counts of Toulouse was recognized through out half of Provence, and they held the rich cities of the most cultured and wealthiest portion of France.
Languedoc

cities which had a high degree of local independence. Their local governments, with their consuls at the head, show, at least in name, the influence of Roman ideas. It is still an open question how much of their autonomy had remained untouched by the barbarian invasions from the Roman period. The citizens of these free cities were in continual intercourse with Saracens of Palestine and Moors of Spain; they had never entirely abandoned pagan customs; their poetry—the poetry of the troubadours—taught them the joys of life rather than the fear of death, the licence of their chivalry with its courts of love led to the other extreme of asceticism in such as were of religious temperament; all things combined to make Languedoc the proper soil for heresy. The Church never had the hold upon the country that it had in the north, the people of the Midi were always lukewarm in the faith; there was no noteworthy ecclesiastical literature in Languedoc from the end of the Carolingian period until after the Albigensian crusade, no theological centre like Paris, Bec or Laon. Yet Languedoc furnished the most heroic martyrs for the ascetic Manichaean creed. The era of heresy began with the preaching of Peter de Brucys and his followers, the enqueteurs, who endeavoured to make the clergy and laity renounce their former faith by means of a campaign of public denunciation of their vices and theft, and taught contempt for the clergy. Saint Bernard himself was able to make but temporary headway against this rebellion from a sacramental and institutionalized Christianity. In the first decade of the 13th century came the inevitable conflict. The whole county of Toulouse, with its seifs of Narbonne, Béziers, Fosx, Montpellier and Quercy, was in open and scornful secession from the Catholic Church, and the suppression of this Manichaean or Cathar religion was the end of the brilliant culture of Languedoc. (See Albigenses, Cathars, Inquisition.) The crusade against the Albigenses, as the Cathars were locally termed, in 1209, resulted in the union to the crown of France in 1229 of all the country from Carcassonne to the Rhone, thus dividing Languedoc into two. The western part left to Raymond VII., by the treaty of 1229, included the Agenais, Quercy, Rouergue, the Toulousean and southern Albigois. He had as well the Venaissin across the Rhone. From 1229 to his death in 1249 Raymond VII. worked tirelessly to bring back prosperity to his ruined country, encouraging the foundation of churches and monasteries, and attempting to gain reconciliation with the Church. He left only a daughter, Jeanne, who was married to Alphonse of Poitiers. Alphonse, a sincere Catholic, upheld the Inquisition, but, although ruling the country from Toulouse, maintained peace. Jeanne died without heirs four days after her husband, upon their return from the crusade in Africa, in 1271, and although she attempted by will to prevent the reversion of her lands to the crown, they were promptly seized by King Philip III., who used the opposition of Roger Bernard, count of Foix, as an excuse to appear with a formidable army, which had little to do to secure entire submission. Thus the county of Toulouse passed to the crown, though Philip III. turned over the Agenais to Edward I. of England in 1270. In 1274 he ceded the county of Venaissin to Pope Gregory X., the papacy having claimed it, without legal grounds, since the Albigensian crusade (see Avignon).

Such was the fate of the reduced country of Toulouse. At the death of Philip III. in 1285 Languedoc in 1229 Louis IX. was given all the country from Carcassonne to the Rhone. This royal Languedoc was at first subject to much trickery on the part of northern speculators and government officials. In 1248 Louis IX. sent royal enqueteurs, much like Charlemagne's missi dominici, to correct all abuses, especially to inquire concerning peculation by royal agents. On the basis of their investigations the king issued royal edicts in 1254 and 1259 which organized the administration of the province. Two sénéchaussées were created—one at Nîmes, the other at Carcassonne—each with its lesser divisions of visigeries and bailliages. During the reign of Philip III. the enqueteurs were busily employed securing justice for the conquered, preventing the seizure of lands, and in 1270 a supreme court of justice was established at Toulouse. In 1302 Philip IV. convoked the estates of Languedoc, but in the century which followed they were less an instrument for self-government than one for securing money, thus adding the enqueteurs, who during the Hundred Years' War became mere revenue hunters for the king. In 1355 the Black Prince led a savage plundering raid across the country to Narbonne. After the battle of Poitiers, Languedoc supported he count of Armagnac, but there was no enthusiasm for a national cause. Under Charles V., Louis of Anjou, the king's brother, was governor of Languedoc, and while an active opponent of the English, he drained the country of money. But his extortions were surpassed by those of another brother, the duc de Berry, after the death of Charles V. In 1382 and 1383 the infuriated peasantry, abetted by some nobles, rose in a rebellion—known as the Tuchins—which was put down with frightful butchery, while still greater sums were demanded from the impoverished country. In the anarchy which followed brigandage increased. Redress did not come until 1420, when the dauphin, afterwards Charles VII., came to Languedoc and reformed the administration. Then the country he saved furnished him with the means for driving the English in the north. For the first time, in the climax of its miseries, Languedoc was genuinely united to France. But Charles VII. was not able to drive out the brigands, and it was not until after the English were expelled in 1453 that Languedoc had even comparative peace. Charles VII. united Comminges to the crown; Louis XI. Roussillon and Cerdagne, both of which were ceded to Aragon by Charles VIII. as the price of its neutrality during his expedition into Italy. From the reign of Louis XII. until 1523 the governorship of Languedoc was held by the house of Bourbon. After the treason of the constable Bourbon it was held by the Montmorency family with but slight interruption until 1632.

The Reformation found Languedoc orthodox. Persecution had succeeded. The Inquisition had had no victims since 1340, and the cities which had been centres of heresy were now strongly orthodox. Toulouse was one of the most fanatically orthodox cities in Europe, and remained so in Voltaire's day. But Calvinism gained ground rapidly in the other parts of Languedoc, and by 1560 the majority of the population was Protestant. It was, however, partly a political protest against the misrule of the Guises. The open conflict came in 1561, and from that until the edict of Nantes (1598) there was intermittent civil war, accompanied with iconoclasm on the one hand, massacres on the other and ravages on both.

The main figure in this period is that of Henri de Montmorency, seigneur de Danyville, later duc de Montmorency, governor of the province from 1565, who was, at first, hostile to the Protestants, then from 1574 to 1577, as leader of the "Politiques," an advocate of compromise. But peace was hardly ever established, although there was a yearly truce for the ploughing. By the edict of Nantes, the Protestants were given ten places of safety in Languedoc; but civil strife did not come to an end, even under Henry IV. In 1620 the Protestants in Languedoc rose under Henri, duc de Rohan (1570-1638), who for two years defied the power of Louis XIII. When Louis took Montpellier in 1622, he attempted to reconcile the Calvinists by bribes of money and office, and left Montauban as a city of refuge. Richelieu's extinction of Huguenotism is less the history of Languedoc than of the Huguenots (q.v.). By 1629 Protestantism was crushed in the Midi as a political force. Then followed the tragic episode of the rebellion of Henri II., duc de Montmorency, son of the old governor of Languedoc. As a result, Languedoc lost its old provincial privilege of self-assessment until 1649, and was placed under the governorship of Marshal Schomberg. During Louis XIV.'s reign Languedoc prospered until the revocation of the edict of Nantes. Industries and agriculture were encouraged, roads and bridges were built, and the great canal giving a water route from the Atlantic to the Mediterranean increased the trade of its cities. Colbert especially encouraged its manufactures. The religious persecutions which accompanied the revocation of the edict of Nantes bore hardest on Languedoc, and resulted in a guerilla warfare known as the rebellion of the Camisards (q.v.). On the eve of the Revolution some of the brightest scenes of contentment and prosperity which surprised
Arthur Young, the English traveller in France, were those of the grape harvests in Languedoc vineyards.

In 1790 Languedoc disappeared from the map of France, with the other old provinces; and the departments mentioned took its place. But the peculiar characteristics of the men of the Midi remain as clearly distinct from those of the north as the Scottish type is distinct from the English. The "peaceful insurrection" of the Languedoc vine-growers in the summer of 1907; revealed to the astonished Parisians the same spirit of independence as had underlain the resistance to Simon de Montfort and Richelieu.

The one monumental history of Languedoc is that of the Benedictine Dom Claude Devie and Dom J. J. Vaissete. Histoire de la province de Languedoc (5 vols., Paris, 1730-1749). This has been re-edited, and continued and increased by the addition of important monographs, to 15 volumes (Toulouse, 1872-1892). It is the great library of sources, critical apparatus and bibliographies concerning Languedoc, and carries the history up to 1760. The fine article "Languedoc" in La Grande Encyclopédie is by A. Molinier, perhaps the greatest modern authority on Languedoc. (J. T. S.)*

LANGUET, HUBERT (1518-1581), French Hugenot writer and diplomat, was born at Vitteaux in Burgundy, of which town his father was governor. He received his early education from a distinguished Hellenist, Jean Perelle, and displayed remarkable ability in Greek and Latin. He studied law, theology and science at the University of Poitiers from 1536 to 1539; then, after some travel, attended the universities of Bologna and Padua, and the medical college of Paris from the latter in 1548.

At Bologna he read Melanchthon's Loci communes theologorum and was so impressed by it that in 1549 he went to Wittenberg to see the author, and shortly afterwards became a Protestant. He made his headquarters at Wittenberg until the death of Melanchthon in 1560, although during that period, as well as throughout the rest of his life, he travelled extensively in France, Italy, Spain, Germany, Sweden, and even Finland and Lapland. In 1557 he declined the invitation of Gustavus I. to enter the service of Sweden, but two years later accepted a similar invitation of Augustus I., elector of Saxony. He showed great ability in diplomacy, particularly in organizing the Protestants. He represented the elector at the French court from 1561 to 1572 except when the religious and political troubles in France occasionally compelled him temporarily to withdraw. He performed many minor diplomatic missions for the elector, and in 1567 accompanied him on the expedition to Goth. He delivered a victory there over Charles IX. of France, and on behalf of the Protestant princes, and escaped death on St. Bartholomew's Day (1572) only through the intervention of Jean de Morvilliers, the moderate and influential bishop of Orleans. He represented the elector of Saxony at the imperial court from 1573 to 1577. Financial embarrassment and disgust at the Protestant controversies in which he was forced to participate caused him to seek recall from the imperial court. His request being granted, Languet spent the last years of his life mainly in the Low Countries, and though nominally still in the service of the elector, he undertook a mission to England for John Casimir of Bavaria and was a valuable adviser to William the Silent, prince of Orange. Languet died at Antwerp on the 30th of September 1581.

His correspondence is important for the history of the 16th century, and twenty-nine letters to Augustus of Saxony dating from the 17th of November 1565 to the 8th of September 1581, and one hundred and eleven letters to the chancellor Mordeisen dating from November 1589 to the summer of 1595, are preserved in MS. in the Saxony archives, and were published by Ludovicus at Halle in 1699 under the title Arcana secutis decimi sexti. One hundred and eight letters to Camerarius were published at Groningen in 1646 under the title Langueti Epistolae ad Joannem Cameram, and the grandeur of the letters to Philip Sidney, dating from the 22nd of April 1573 to the 28th of October 1580, appeared at Frankfurt in 1633 and have been translated into English by S. A. Pears (London, 1845). The Historica Descrittione di Firenze, printed at Venice in 1568, and the Anatomy of the World by which Languet is best known has been disputed. It is entitled Vindiciae contra tyrannos, sive de principibus in populum populique in principem legitima possident, Stephano Jonio Brito Celia autore, and is thought to have been published at Basel (1579) although it bears the impress of Edinburgh. It has been attributed to Beza, Hotman, Casaubon and Dupleis-Mornay, by divers writers on various grounds—to the last-named on the very respectable authority of Grotius. The authorship of Languet was supported by some of his contemporaries (see Dictionnaire) and confirmed by practically all later writers. The work has been frequently reprinted, the Leipzig edition (1846) containing a life of Languet by Treitsche. A French translation appeared in the journal of the Société des Langues of 1869. The work upholds the doctrine of resistance, but affirms that resistance must come from properly constituted authorities and objects to anything which savours of anabaptism or other extreme views. The Apologie ou defense de l'usage de la langue commune (for the French language in France, and in the Dutch Republic; and Blok, History of the People of the Netherlands).

Langueet, a member of the nobility, was descended from a powerful family of the Languedoc, in the service of the French crown. He was appointed to the post of governor of Languedoc in 1557 and continued in office until 1577. He was known for his staunch Protestantism and his support of religious freedom. Langueet is often referred to as the father of French nationalism and is credited with the development of the French language and its literary forms. He is also known for his contributions to law and diplomacy, serving as a diplomat for the French crown. Throughout his career, Langueet maintained his commitment to the principles of freedom and justice, and his legacy continues to inspire and inform modern-day political and social movements.
About this time the first symptoms of consumption appeared. He subsequently served in a blockade-runner, but his vessel was captured, and he was confined for five months in a Federal prison, his flute proving the best of companions. Exchanged early in 1865, he started home on foot, arriving in a state of exhaustion that led to a severe illness. In 1867 he visited New York in connexion with his novel *Tiger Lilies*—an immature work, dealing in part with his war experiences, and now difficult to obtain. Later in the same year he took charge of a country school in Alabama, and was married to Miss Mary Day of his native town. The next year he returned to Macon in low health, and began to study and practise law with his father. In 1882 he went to Texas for his health, but was forced to return, and he secured an engagement as first flute in the Peabody concerts at Baltimore (December 1873). He wrote a guide-book to Florida (1876), and tales for boys from Froissart, Malory, the Mabinogion and Percy’s *Reliques* (1878–1882). He now made congenial friends, such as Bayard Taylor, his reputation gradually increased, and he was enabled to study music and literature, especially Anglo-Saxon poetry. In 1897 he wrote his ambitious cantata for the Centennial Exhibition, and brought his family north. A small volume of verse appeared in the next year. In 1879 he was made lecturer on English literature at Johns Hopkins University. His lectures became the basis of his *Science of English Verse* (1880)—his most important prose work, and an admirable discussion of the relations of music and poetry—and also of his *English Novel* (New York, 1883), which, devoted largely to George Eliot, is suggestive, but one-sided. Work had to be abandoned on account of growing feebleness, and in the spring of 1881 he was carried to Lynn, North Carolina, to try camp life, and died there on the 7th of September. Since his death his fame has grown steadily and greatly, an enlarged and final edition (1884) of his poems, prepared by his wife, his *Letters*, 1866–1881 (1893), and several volumes of miscellaneous prose having assisted in keeping his name before the public. A posthumous work on *Shakespeare and his Forerunners* (London, 2 vols., 1903) was edited by H. W. Lanier. Among his more noteworthy poems are “Corn,” “The Revenge of Hamish,” “Song of the Chattahoochee” and “The Marshes of Glynn.” By some his genius is regarded as musical rather than poetic, and his style is considered hectic; by others he is held to be one of the most original and most talented of modern American poets. He is considered the leading writer of the New South, the greatest Southern poet since Poe, and a man of heroic and exquisite character.

**LANJUNAIS, JEAN DENIS.** Comte (1753–1827). French politician, was born at Rennes (Ille-et-Vilaine) on the 12th of March 1753. After a brilliant college career, which made him doctor of laws and a qualified barrister at nineteen, he was appointed counsel to the Breton estates and in 1775 professor of ecclesiastical law at Rennes. At this period he wrote two important works which, owing to the distracted state of public affairs, remained unpublished, *Institutiones juris ecclesiasticorum* and *Prælectiones juris ecclesiasticorum*. He had begun his career at the bar by pleading against the feudal *droit du colombier*, and when he was sent by his fellow-citizens to the states-general of 1789 he demanded the abolition of nobility and the substitution of the title of king of the French and the Navarrese for king of France and Navarre, and helped to establish the civil constitution of the clergy. Returned to the Convention in September 1792 he developed moderate, even reactionary views, becoming one of the fiercest opponents of the Mountain, though he never wavered in his support of republican principles. He refused to vote for the death of Louis XVI., alleging that the nation had no right to despatch a vanquished prisoner. His daily attacks on the Mountain resulted, on the 15th of April 1793, in demand by the commune for his exclusion from the assembly, but, undaunted, when the Parisian populace invaded the Chamber on the 2nd of June, Lanjuinais renewed his defiance of the victorious party. Placed under arrest with the Girondins, he escaped to Rennes where he drew up a pamphlet denouncing the constitution of 1793 under the curious title *Le Dernier Crime de Lanjuinais* (Rennes, 1793). Pursued by J. B. Carrier, who was sent to stamp out resistance in the west, he lay hidden until some time after the revolution of Thermidor (July 1794), but he was re-admitted to the Convention on the 8th of March 1795. He maintained his liberal and independent attitude in the Conseil des Anciens, the Senate and the Chamber of Peers, being president of the upper house during the Hundred Days. Together with G. J. B. Target, J. E. M. Portalis and others he founded under the empire an academy of legislation in Paris, himself lecturing on Roman law. Closely associated with oriental scholars, and a keen student of oriental religions, he entered the Academy of Inscriptions in 1808. After the Bourbon restoration Lanjuinais consistently defended the principles of constitutional monarchy, but most of his time was given to religious and political subjects. Besides many contributions to periodical literature he wrote, among other works, *Constitutiones de la nation française* (1819); *Appréciation du projet de loi relatif aux trois concordats* (1806, 6th ed. 1827), in defence of Gallicanism; and *Études biographiques et littéraires sur Antoine Arnaud, P. Nicole et Jacques Necker* (1823). He died in Paris on the 13th of January 1827.

His son, **VICTOR AMBROISE, VICOMTE DE LANJUNAIS** (1802–1869), was also a politician, becoming a deputy in 1838. His interests lay chiefly in financial questions and in 1849 he became minister of commerce and agriculture in the cabinet of Odilon Barrot. He wrote a *Notice historique sur la vie et les ouvrages du comte de Lanjuinais*, which was prefixed to an edition of his father’s *Œuvres* (4 vols., 1832).

**LANMAN, CHARLES ROCKWELL** (1850–1932). American Sanskrit scholar, was born in Norwich, Connecticut, on the 8th of July 1850. He graduated at Yale in 1871, was a graduate student there (1871–1873) under James Halley and W. D. Whitney, and in Germany (1873–1876) studied Sanskrit under Weber and Roth and philology under Georg Curtius and Leskien. He was professor of Sanskrit at Johns Hopkins University in 1876–1880 and subsequently at Harvard University. In 1880 he travelled in India and bought for Harvard University Sanskrit and Prâkt books and manuscripts, which, with those subsequently bequeathed to the university by Fitzedward Hall, make the most valuable collection of its kind in America, and made possible the *Harvard Oriental Series*, edited by Professor Lanman. In 1879–1884 he was secretary and editor of the *Transactions*, and in 1884–1890 president of the American Philological Association. In 1884–1885 he was the corresponding secretary of the American Oriental Society, in 1897–1907 vice-president, and in 1907–1908 president. In the *Harvard Oriental Series* he translated (vol. iv.) into English Râjapekha’s *Kârputra-Mañjari* (1900), a Prâkt drama, and (vols. vii. and viii.) revised and edited Whitney’s translation of, and notes on, the *Atharva-Veda Samhita* (2 vols., 1905); he published *A Sanskrit Reader*, with *Vocabulary and Notes* (2 vols., 1884–1888); and he wrote on early Hindu pantheism and contributed the section on Brahmanism to *Messages of the World’s Religions*.

**LANNES, JEAN**, duke of Montebello (1769–1809), marshal of France, was born at Lectoure (Gers) on the 11th of April 1769. He was the son of a lively stable keeper, and was apprenticed to a dyer. He had had little education, but his great strength and proficiency in all manly sports caused him in 1792 to be elected sergeant-major of the battalion of volunteers of Gers, which he had joined on the breaking out of war between Spain and the French republic. He served through the campaigns in the Pyrenees in 1793 and 1794, and rose by distinguished
conducted to the rank of chef de brigade. However, in 1795, on the reform of the army introduced by the Thermidorians, he was dismissed from his rank. He re-entered as a simple volunteer in the army of Italy, and in the famous campaign of 1796 he again fought his way up to high rank, being eventually made a general of brigade by Bonaparte. He was distinguished in every battle, and was wounded at Arcola. He was chosen by Bonaparte to accompany him to Egypt as commander of one of Kléber's brigades, in which capacity he greatly distinguished himself, especially on the retreat from Syria. He went with Bonaparte to France, assisted at the 18th Brumaire, and was appointed general of division, and commander of the consular guard. He commanded the advanced guard in the crossing of the Alps in 1800, was instrumental in winning the battle of Montebello, from which he afterwards took his title, and bore the brunt of the battle of Marengo. In 1801 Napoleon sent him as ambassador to Portugal. Opinions differ as to his merits in this capacity: Napoleon never made such use of him again. On the establishment of the empire he was created a marshal of France, and commanded one of the more advanced guard of a great French army in the campaign of Austerlitz. At Austerlitz he had the left of the Grand Army. In the 1806–07 campaign he was at his best, commanding his corps with the greatest credit in the march through the Thuringian Forest, the action of Saalfeld (which is studied as a model to-day at the French Staff College) and the battle of Jena. His leadership of the advanced guard at Friedland was even more conspicuous. He was now to be tried as a commander-in-chief, for Napoleon took him to Spain in 1808, and gave him a detached wing of the army, with which he won a victory over Castaños at Tudela on November 22. In January 1809 he was sent to attempt the capture of Saragossa, and by February 21, after one of the most stubborn defences in history, was in possession of the place. Napoleon then created him duc de Montebello, and in 1809, for the last time, gave him command of the advanced guard. He took part in the engagement around Eckmühl and the advance on Vienna. With his corps he led the French army across the Danube, and bore the brunt, with Masséna, of the terrible battle of Aspern-Essling (q.v.). On the 22nd of May he had to retreat. During the retreat Lannes exposed himself as usual to the hottest fire, and received a mortal wound, to which he succumbed at Vienna on the 31st of May. As he was being carried from the field to Vienna he met the emperor hurrying to the front. It was reported that the dying man reproached Napoleon for his ambition, but this rests on little evidence save the fact that Lannes was the most blunt and outspoken of all Napoleon's marshals. He was one of the few men for whom the emperor felt a real and deep affection, and at this their last meeting Napoleon gave way to a passionate burst of grief, even in the midst of the battle. His eldest son was made a peer of France by Louis XVIII.

Lannes ranks with Davout and Masséna as the ablest of all Napoleon's marshals, and consciously or unconsciously was the best exponent of the emperor's method of making war. Hence his constant employment in tasks requiring the utmost resolution and daring, and more especially when the emperor's combinations depended on the skill and sagacity with which he could see through the enemy's dispositions of the army. It was thus with Lannes at Friedland and at Aspern as it was with Davout at Austerlitz and Auerstädt, and Napoleon's estimate of his subordinates' capacities can almost exactly be judged by the fact that with which he used them on these two occasions, his own shattering blow. Routine generals with the usual military virtue, or careful and exact troop leaders like Soult and Macdonald, Napoleon kept under his own hand for the final assault which he himself selected. As a long-service officer of long experience, he constantly faced the odds of two to one, which alone made the final blow possible, he entrusted only to men of extraordinary courage and high capacity for command. In his own words, he found Lannes a pigmy, and lost him regret. Lannes was in fact not a man.

LANNION, a town of north-western France, capital of an arrondissement in the department of Côtes-du-Nord, on the right bank of the Léguer, 45 m. W.N.W. of St Brieuc by rail. Pop. (1906) 5336. Lannion is 5 m. in direct line from the mouth of the Léguer; its port does a small trade (exports of agricultural produce, imports of wine, salt, timber, &c.), and there is an active fishing industry. The town contains many houses of the 15th and 16th centuries and other old buildings, the chief of which is the church of St Jean-du-Baly (16th and 17th centuries). On an eminence close to Lannion is the church of Brélevê from the 12th century, restored in the 15th or 16th century; it has an interesting 16th-century Holy Sepulchre.

Some 6 m. S.E. of the town are the imposing ruins of the château de Tonquédec (c. 1300) styled the “Pierrefonds of Brittany,” and there are other buildings of antiquarian interest in the vicinity. The coast north of Lannion at Trégastel and Ploumanac presents curious rock formations.

Lannion is the seat of a subprefecture and has a tribunal of first instance and a communal college. Its industries include saw-milling, tanning and the manufacture of farm implements. The town was taken in 1346 by the English; it was defended against them by Geoffroy de Pontblanc whose valour is commemorated by a cross close to the spot where he was slain.

LANNY, GUILLAUME DE (1536–1602), Flemish diplomatist, was chamberlain to the duke of Luxembourg, governor of the fort of Sluis, and a knight of the Golden Fleece. He discharged several diplomatic missions in France, England, Prussia, Poland and Lithuania, and was one of the negotiators of the treaty of Troyes (1420). In 1421 he was sent by Henry V. of England to Palestine in order to inquire into the possibility of reviving the kingdom of Jerusalem, and wrote an account of his travels, Les Pèlerinages de Surye et de Egipte, which was published in 1526 and again in 1542.

LANolin (Lat. lana, wool, and oleum, oil), the commercial name of the preparation styled adeps lanae hydrosus in the British Pharmacopoeia, and which consists of 7 oz. of neutral wool-fat (adeps lanae) mixed with 3 fluid oz. of water. The wool-fat is obtained by purification of the “brown grease,” “recovered grease” or dégras extracted from raw sheep's wool in the process of preparing it for the spinner. It is a translucent unctuous substance which has the property of taking up large quantities of water and forming solutions which are very slow to separate into their constituents. Owing to the ease with which it penetrates the skin, wool-fat both in the anhydrous form and as lanolin, sometimes mixed with such substances as vaseline or fatty oils, is largely employed as a basis for ointments. It is slightly antiseptic and does not become rancid.

La NOUe, Francois DE (1552–1591), called Bras-de-Fer, one of the Huguenot captains of the 16th century, was born near Nantes in 1551, of an ancient Breton family. He served in Italy under Marshal Brissac, and in the first Huguenot war, but his first great exploit was the capture of Orleans at the head of only fifteen cavaliers in 1567, during the second war. At the battle of Jarnac in March 1569 he commanded the rearguard, and at Moncontour in the following October he was taken prisoner; but he was exchanged in time to resume the governorship of Poitou, and to inflict a signal defeat on the royal troops before Rocroi. At the siege of Fontenay (1570) his left arm was shattered by a bullet; but a mechanic of Rochelle made him an iron arm (hence his sobriquet) with a hook for holding his reins. When peace was made in France in the same year, La Noue carried his sword against the Spaniards in the Netherlands, but was taken at the recapture of Mons by the Spaniards in 1572. Permitted to return to France, he was commissioned by Charles IX, after the massacre of St Bartholomew, to reconcile the inhabitants of La Rochelle, the great stronghold of the Huguenots, to the king. But the Rochelais were too much alarmed to come to terms; and La Noue, perceiving that war was imminent, and knowing that his post was on the Huguenot side, gave up his royal commission, and from 1574 till 1578 acted as general of La Rochelle. When peace was again concluded La Noue once more went to aid the Protestants of the Low Countries. He took several towns and captured Count Egmont in 1580; but a few weeks afterwards he fell into the hands of the Spaniards. Thrust into a loathsome prison at Limerick, La Noue, the admiration of all, of whatever faith, by his gallantry, honour and purity of character, was kept confined for five years by a powerful nation, whose reluctance to set him
LANSDOWNE, MARQUISES OF

free is one of the sincerest tributes to his reputation. It was in captivity that he wrote his celebrated Discours politiques et militaires, a work which was published at Basel in 1787; republished at La Rochelle 1790, Frankfurt on Main (in German) 1502 and 1612; and London (in English) 1507—and had an immense influence on the soldiers of all nations. The abiding value of La Noue’s “Discourses” lies in the fact that he wrote of war as a human drama, before it had been elaborated and codified.

At length, in June 1585, La Noue was exchanged for Egmont and other prisoners of consideration, while a heavy ransom and a pledge not to bear arms against his Catholic majesty were also exacted from him. Till 1586 La Noue took no part in public matters, but in that year he joined Henry of Navarre against the Leaguers. He was present at both sieges of Paris, at Ivry and other battles. At the siege of Lamblette in Brittany he received a wound of which he died at Montmorency on the 4th of August 1591.

He wrote, besides the Discourses, Déclaration pour prise d’armes et la défense de Sedan et Jamets (1588); Observations sur l’histoire de Guicciardini (2 vols., 1592); and notes on Plutarch’s Lives. His Correspondance was published in 1854. See La Vie de François, seigneur de La Noue, by Muyse Amrart (Leiden, 1613); Brançon-Vitou, Capitaines Capitaines français; C. Vincen’s Les Héros de la Réforme, Fr. de La Noue (1875); and Hauser, François de La Noue (Paris, 1892).

LANSDOWNE, WILLIAM PETTY FITZMAURICE, 1ST MARQUESSE OF (1737–1805). British statesman, better known under his earlier title of Earl of Shelburne, was born at Dublin on the 20th of May 1737. He was a descendant of the lords of Kerry (dating from 1181), and his grandfather Thomas Fitzmaurice, who was created earl of Kerry (1723), married the daughter of Sir William Petty (q.v.). On the death without issue of Sir William Petty’s sons, the first earls of Shelburne, the estates passed to his nephew John Fitzmaurice (advanced in 1753 to the earldom of Shelburne), who in 1751 took the additional name of Petty. His son William spent his childhood “in the remotest parts of the south of Ireland,” and, according to his own account, when he entered Christ Church, Oxford, in 1755, he had both “everything to learn and everything to unlearn.” From a tutor whom he describes as “narrow-minded” he received advantageous guidance in his studies, but he attributes his improvement in manners and in knowledge of the world chiefly to the fact that, as was his “fate through life,” he fell in “with clever but unpopular connexions.” Shortly after leaving the university he served in Wolfe’s regiment during the Seven Years’ War, and so distinguished himself at Minden and Kloster-Kampen that he was raised to the rank of colonel and appointed aide-de-camp to the king (1760). Being thus placed in close communication with Lord Bute, he was in 1761 employed by that nobleman to negotiate for the support of Henry Fox, Lord Holland. He was returned to the House of Commons as member for Wycombe, but in 1761 he succeeded his father as earl of Shelburne in the Irish peerage, and Baron Wycombe in the peerage of Great Britain (created 1760). Though he declined to take office under Bute he undertook negotiations to induce C. J. Fox to gain the consent of the Commons to the peace of 1763. Fox affirmed that he had been duped, and, although Shelburne always asserted that he had acted in thorough good faith, Bute spoke of the affair as a “pious fraud.” Shelburne joined the Grenville ministry in 1763 as president of the Board of Trade, but, failing in his efforts to replace Pitt in the cabinet, he in a few months resigned office. Having moreover on account of his support of Pitt on the question of Wilkes’s expulsion from the House of Commons incurred the displeasure of the king, he retired for a time to his estate. After Pitt’s return to power in 1766 he became secretary of state, but during Pitt’s illness his conciliatory policy towards America was completely thwarted by his colleagues and the king, and in 1768 he was dismissed from office. In 1782 he consented to take office under the marquess of Rockingham on condition that the king would recognize the United States. On the death of Lord Rockingham in the same year he became premier; but the secession of Fox and his supporters led to the famous coalition of Fox with North, which caused his resignation in the following February, his fall being perhaps hastened by his plans for the reform of the public service. He had also in contemplation a bill to promote free commercial intercourse between England and the United States. When Pitt acceded to office in 1784, Shelburne, instead of receiving a place in the cabinet, was created marquess of Lansdowne. Though giving a general support to the policy of Pitt, he from this time ceased to take an active part in public affairs. He died on the 7th of May 1805. During his lifetime he was blamed for insincerity and duplicity, and he incurred the deepest unpopularity, but the accusations came chiefly from those who were dissatisfied with his preference of principles to party, and if he had had a more unscrupulous regard to his personal ambition, his career as a statesman would have had more outward success. He was cynical in his estimates of character, but no statesman of his time possessed more enlightened political views, while his friendship with those of his contemporaries eminent in science and literature must be allowed considerable weight in qualifying our estimate of the moral defects with which he has been credited. He was twice married, first to Lady Sophia (1745–1771), daughter of John Carteret, Earl Granville, through whom he obtained the Lansdowne estates near Bath, and secondly to Lady Louisia (1755–1780), daughter of John Fitzpatrick, 1st earl of Upper Ossory. John Henry Petty Fitzmaurice (1765–1809), his son by the first marriage, succeeded as 2nd marquess, after having sat in the House of Commons for twenty years as member for Chipping Wycombe.

HENRY PETTY FITZMAURICE, 3rd Marquess of Lansdowne (1750–1863), son of the 1st marquess by his second marriage, was born in June 1780 and educated at Edinburgh University and at Trinity College, Cambridge. He entered the House of Commons in 1802 as member for the family borough of Calne and quickly showed his mettle as a politician. In February 1806, as Lord Henry Petty, he became chancellor of the exchequer in the ministry of “All the Talents,” being at this time member for the university of Cambridge; but he lost both his seat and his office in 1807. In 1808 he became marquess of Lansdowne; and in the House of Lords and in society he continued to play an active part as one of the Whig leaders. His chief interest was perhaps in the question of Roman Catholic emancipation, a cause which he consistently championed, but he sympathized also with the advocates of the abolition of the slave-trade and with the cause of popular education. Lansdowne, who had succeeded his cousin, Francis Thomas Fitzmaurice, as 4th earl of Kerry in 1818, took office with Canning in May 1827, and was in the House of Lords, and twice again in the House of Commons, until January 1828; he was lord president of the council under Earl Grey and then under Lord Melbourne from November 1830 to August 1841, with the exception of the few months in 1835 when Sir Robert Peel was prime minister. He held the same office during the whole of Lord John Russell’s ministry (1846–1852), and, having declined to become prime minister, sat in the cabinets of Lord Aberdeen and of Lord Palmerston, but without office. In 1857 he refused the offer of a dukedom, and he died on the 31st of January 1853. Lansdowne’s social influence and political moderation made him one of the most powerful Whig statesmen of the time; he was frequently consulted by Queen Victoria on matters of moment, and his long official experience made his counsel invaluable to his party. He married Louisa (1785–1851), daughter of the 2nd earl of Ilchester, and was succeeded by his son Henry, the 4th marquess (1816–1866). The latter, who was member of parliament for Calne for twenty years and chairman of the Great Western railway, married for his second wife Emily (1819–1892), daughter of the comte de Flahaut de la Billardière, a lady who became Baroness Naîrière in her own right in 1867. By her he had two sons, the 5th marquess and Lord Edmond Fitzmaurice (Baron Fitzmaurice of Leigh).

HENRY CHARLES KEITH PETTY FITZMAURICE, 5th Marquess of Lansdowne (b. 1845), was educated at Balliol, Oxford, where he became one of Jowett’s favourite pupils. In 1869 he married
the daughter of the 1st duke of Abercorn. As a member of the Liberal party he was a lord of the treasury (1860-1872), under-secretary of war (1872-1874), and under-secretary of India (1880); in 1883 he was appointed governor-general of Canada, and from 1888 to 1893 he was viceroy of India. He joined the Liberal Unionist party when Mr Gladstone proposed home rule for Ireland, and on returning to England became one of its most influential leaders. He was secretary of state for war from 1893 to 1900, and foreign secretary from 1900 to 1906, becoming leader of the Unionist party in the House of Lords on Lord Salisbury's death.

His brother Edmond George Fitzmaurice, Baron Fitzmaurice (b. 1846), was educated at Trinity, Cambridge, where he took a first class in classics. Unlike Lord Lansdowne, he remained a Liberal in politics and followed Mr Gladstone in his home rule policy. As Lord Edmond Fitzmaurice he entered the House of Commons in 1868, and was under-secretary for foreign affairs from 1882 to 1885. He later sat in parliament till 1868, when he was elected for the Cricklade division of Wilts, and retiring in 1905, he was created Baron Fitzmaurice of Leigh in 1906, and made under-secretary for foreign affairs in Sir Henry Campbell-Bannerman's ministry. In 1906 he became chancellor of the duchy of Lancaster and a member of the Liberal cabinet, but resigned his post in 1909. He devoted much time to literary work, and was the author of excellent biographies of the 1st marquess, of Sir William Petty (1895), and of Lord Granville (1905), under whom he had served at the foreign office.

For the 1st marquess, see Lord Fitzmaurice, Life of William, Earl of Shelburne (3 vols., London, 1875-1876).

LANSDOWNE, a hill cantonment in India, in Garhwal district of the United Provinces, about 6000 ft. above the sea, 10 m. by cart road from the station of Kotdwar on the Oudh and Rohilkhand railway. Pop. (1901) 3442. The cantonment, founded in 1857, extends for more than 3 m. through pine and oak forests, and can accommodate three Gurkha battalions.

LANSING, the capital of Michigan, U.S.A., in Ingham county, at the confluence of the Grand and Cedar rivers, about 85 m. W.N.W. of Detroit and about 64 m. E.S.E. of Grand Rapids. Pop. (1900) 16,485, of whom 2307 were foreign-born; (1910 census) 31,229. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Grand Trunk and the Pere Marquette railways, and by interurban electric lines. The Grand river on its way through the city makes a horse-shoe bend round a moderately elevated plateau; this is the commercial centre of the city, and here, in a square covering 10 acres, is the State Capitol, erected in 1873-1878 and containing the State library. On the opposite side of the river, farther N., and also extending across the southern portion of the city, are districts devoted largely to manufacturing. Lansing has a public library and a city hospital. About 3 m. E. of the city, at East Lansing, is the State Agricultural College (coeducational), the oldest agricultural college in the United States, which was provided for by the state constitution of 1850, was organized in 1855 and opened in 1857. Its engineering college was begun in 1858; a course in home economics for women was established in 1866; and a forestry course was opened in 1892. In connexion with the college there is an agricultural experiment station. Lansing is the seat of the Michigan School for the Blind, and of the State Industrial School for Boys, formerly the Reform School. The city has abundant water-power and is an important manufacturing centre. The value of the factory products increased from $3,692,366 in 1900 to $8,887,445 in 1904, or 154-1%. The municipality owns and operates the water-works and the electric-lighting plant. The place was selected as the site for the capital in 1847, when it was still known as the Mission Station, and growth was slow until 1862, when the railways began to reach it. Lansing was chartered as a city in 1859 and rechartered in 1893.

LANSING MAN, the term applied by American ethnologists to certain human remains discovered in 1902 during the digging of a cellar near Lansing, Kansas, and by some authorities believed to represent a prehistoric type of man. They include a skull and several large adult bones and a child's jaw. They were found beneath 20 ft. of undisturbed silt, in a position indicating intentional burial. The skull is preserved in the U.S. National Museum at Washington. It is similar in shape to those of historic Indians of the region. Its ethnological value as indicating the existence of man on the Missouri in the glacial period is very doubtful, it being impossible accurately to determine the age of the deposits.

LANQUENET, the French corrupted form of the German Landsknecht (q.v.), a mercenary foot-soldier of the 16th century. It is also the name of a card game said to have been introduced into France by the Landsknechte. The pack of 52 cards is cut by the player at the dealer's right. The dealer lays the two first cards face upwards on the table to his left; the third he places in front of him and the fourth, or réjouissance card, in the middle of the table. The players, usually called (except in the case of the dealer) punters, stake any sum within the agreed limit upon this réjouissance card; the dealer, who is also the banker, covers the bets and then turns up the next card. If this fails to match any of the cards already exposed, it is laid beside the réjouissance card and then punters may stake upon it. Other cards not matching are treated in the same manner. When a card is turned which matches the réjouissance card, the banker wins everything staked on it, and in like manner he wins what is staked on any card (save his own) that is matched by the card turned. The banker pays all stakes, and the deal is over as soon as a card appears that matches his own; excepting that should the two cards originally placed at his left both be matched before his own, he is then entitled to a second deal. In France matching means winning, not losing, as in Great Britain. There are other variations of play on the continent of Europe.

LANTARA, SIMON MATHURIN (1729-1778), French landscape painter, was born at Oney on the 24th of March 1729. His father was a weaver, and he himself began life as a herdboy; but, having attracted the notice of Gille de Reumont, a son of his master, he was placed under a painter at Versailles. Endowed with great facility and real talent, his powers found ready recognition; but he found the constraint of a regular life and the society of educated people unbearably tiresome; and as long as the proceeds of the last sale lasted he lived careless of the future in the company of obscure workmen. Rich amateurs more than once attracted him to their houses, only to find that in ease and high living Lantara could produce nothing. He died in Paris on the 22nd of December 1778. His works, now much prized, are not numerous; the Louvre has one landscape, "Morning," signed and dated 1761. Bernard, Joseph Vernet, and others are said to have added figures to his landscapes and sea-pieces. Engravings after Lantara will be found in the works of Lebas, Piquenot, Duret, Mouchy and others. In 1809 a comedy called Lantara, or the Painter in the Pothouse, was brought out at the Vaudeville with great success.

See E. Bellier de la Chavignerie, Recherches sur le peintre Lantara (Paris, 1832).

LANTERN (an adaptation of the Fr. lanterne from Lat. lanterna or laterna, supposed to be from Gr. λαμπρη, a torch or lamp, λαμπρευς, to shine, cf. "lamp"; the 16th- and 17th-century form "lanthorn" is due to a mistaken derivation from "horn," as a material frequently used in the making of lanterns), a metal case filled in with some transparent material, and used for holding a light and protecting it from rain or wind. The appliance is of two different kinds—the hanging lantern and the hand-lantern—both of which are sometimes called "lanterns." At Pompeii and Herculaneum have been discovered two cylindrical bronze lanterns, with ornamental pillars, to which chains are attached for carrying or hanging the lantern. Plates of horn surrounded the bronze lamp within, and the cover at the top can be removed for lighting and for the escape of smoke. The hanging lantern for lighting rooms was composed of ornamental metal work, of which iron and brass were perhaps
most frequently used. Silver, and even gold, were, however, sometimes employed, and the artisans in metal of the 17th and 18th centuries produced much exceedingly artistic work of this kind. Oriental lanterns in open-work bronze were often very beautiful. The early lanterns had sides of horn, talc, bluish glass, and oiled paper, and the primitive shape remains in the common square stable lantern with straight glass sides, to carry a candle. The hand lantern was usually a much more modest appliance than the hanging lantern, although in great houses it was sometimes richly worked and decorated. As glass grew cheaper it gradually ousted all other materials, but the horn lantern which was already ancient in the 17th century was still being used in the early part of the 19th. By the end of the 18th century lanterns in rooms had been superseded by the candlestick.

The collapsible paper lanterns of China and Japan, usually known as Chinese lanterns, are globular or cylindrical in shape, and the paper is pleated and when not in use folds flat. For illuminative and decorative purposes they are coloured with patterns of flowers, &c. The lanterns carried by the ordinary foot passenger are made of oil-paper. In China the “Feast of Lanterns” takes place early in the New Year and lasts for four days. In Japan the festival of Bon is sometimes known as the feast of lanterns.” It is then that the spirits of the dead are thought to return to the household altar. The festival takes place in July. The “bull’s-eye” lantern has a convex lens which concentrates the light and allows it to be thrown in the shape of a diverging cone. The “dark lantern” has a shutter or slide arrangement by which the light can be shut off at will. Ships’ lanterns are used as masthead or other signal lights. On Tranjan’s column is a representation of a heavy poop-lantern on a ship. The ships’ lanterns of the 16th and 17th centuries were highly ornamental, especially when placed on the poop. At the Armada Real in Madrid is a collection of these 16th-century ships’ lanterns. The protected cages which contain the lights used in lighthouses are also known as lanterns” (see Lighthouses).

In architecture a lantern is primarily a framework of timber, with windows all round, to admit ample light, placed on the top of a roof. In a broader sense, it is applied to those portions of buildings which are largely perforated with windows, and more especially to the upper part of the towers of cathedrals and churches, as in the octagon of Ely cathedral, or the tower of Boston church, Lincolnshire. The term is also applied to the entire church, as in the case of Bath Abbey church, which was called the “lantern of England,” from the number of its windows, and St John’s Priory at Kilkenney, the “lantern of Ireland,” on account of the window on the south side of the choir which was 54 ft. long. In the Renaissance style the lantern was looked upon as a decorative feature surmounting the dome, as in St Peter’s, Rome, the Invalides, Paris, and St Paul’s, London.

Magic or Optical Lantern.

The magic or optical lantern is an instrument for projecting on a white wall or screen largely magnified representations of transparent pictures painted or photographed on glass, or of objects—crystals, animals, &c.—carried on glass slides or in glass vessels. If the light traverses the object, the projection is said to be diascopic, if by reflected light, episcopic.

The invention of the magic lantern is usually attributed to Athanasius Kircher, who described it in the first edition (1646) of his Ars magna lucis et umbrae, but it is very probably of earlier discovery. For a long period the lantern was used chiefly to exhibit comic pictures, or in the hands of so-called wizards to summon up ghosts and perform other tricks, astonishing those ignorant of the simple optical principles employed. Within recent years, however, the optical lantern has been greatly improved in construction, and its use widely extended. By its means finely executed photographs on glass can be shown greatly magnified to large audiences, thus saving the trouble and expense of preparing large diagrams. When suitably constructed, it can be used in the form of a microscope to exhibit on a screen the forms and movements of minute living organisms, or to show to an audience delicate physical and chemical experiments which could otherwise be seen only by a few at a time. Another application of the optical lantern is found in the cinematograph (q.v.).

The optical lantern is in its simplest form, consists of the following parts: (1) the lantern body, (2) a source of light, (3) an optical system for projecting the images. The lantern body is a rectangular casing usually made of Russian iron, but sometimes covered with wood which must be protected by asbestos at parts liable to damage by heat), provided with a handle and lid. The source of light is the source of light, windows for viewing the same, a chimney for conveying away the products of combustion, fittings to carry the slides and the optical system. In the earlier and simpler lanterns, oil lamps were employed. With the development of new types of lanterns for an ordinary gas jet is still employed. Natural petroleum burnt in a specially constructed lamp by means of two or three parallel wicks set edgeways to the lenses was employed in the sciotograph, an improved lantern invented by Eadweard Muybridge which gave well-defined pictures 5 to 10 ft. in diameter. The Argand gas burner forms the lantern.

A great improvement attended the introduction of lime-light, i.e. the light emitted by a block of lime made incandescent by an impinging oxy-hydrogen or oxygen-coal-gas flame, and the readiness with which hydrogen and oil or kerosene lamp oil could be made available by compression in steel cylinders and the increased commercial supply of coal-gas greatly popularised these illuminants. Main improvements were made on the original apparatus. The lenticular apparatus was specially modified to disintegrating the effects of the flame, and are mounted on a rotating pin in order that fresh surfaces may be brought into play. Cones of light are also illuminated in the same way; or a thorium mantle of the slide, in conjunction with alcohol stoves, may be used. The lenses of the lantern are in use: (1) the "free-through jet," in which the oxygen is forced through the jet of the burning gas (this is the safest type), (2) the "free-through burner" in which the gases are moved before combustion (this is the more dangerous but also the more powerful), and are also in use. In one type the oxygen supply is divided into two streams, one of which passes through a chamber containing cotton wool soaked with ether, and then the undiverted stream at the jet. The effect of this is to cause ignition of the oxygen and air or of the gas itself in the lantern.

The actual size of the source is comparatively small, and hence it is necessary to mount the carbons so that the arc shall be at one point on the axis of the optical system. It is also advisable to set back the carbons relatively to one another and to tilt them, so that the brightest part of the "crater" faces the lens.

Optical System.—In the ordinary (or vertically) projecting lantern the rays are transmitted through a lens termed the "condenser" then through the object, and finally through another lens termed the "objective." In the horizontally projecting types the light, after passing through the condenser, is reflected vertically by a plane mirror placed at the object of the light; it then traverses another lens, then the object, then the light is reflected horizontally by a plane mirror inclined at 45°, or by a right angled glass prism, the hypotenuse face of which is silivered. In the projection of a picture, the light, having traversed the condenser, is reflected on to the object, placed horizontally in the image mirror. The rays reflecting the object then traverse the objective, and are then projected horizontally, by a mirror or prism. This device in the case of an object, a convenient remedy is to place an erecting prism before the lens. The object of the condenser is to render light as possible from the source, and pass it through the object in a uniform beam. For this purpose the condenser should subtend as large an angle as possible at the source of light. To secure this, it is advisable to make the condenser considerably larger than its local length, small. Since effective single lenses of large diameter are necessarily of long focus, a really good condenser of considerable diameter and yet of short focus must be a combination of two or more lenses. In this system the condenser be white and limpid and free from deposits or striae.

In the earlier lanterns, as still in the cheaper forms, only a single plano-convex lens or bull’s-eye was employed as a condenser. A group of plano-convex or aspheric lenses of similar curvature is the proposed by Herschel, consisting of a biconvex lens and a meniscus mounted together with the concave side of the meniscus next the light. Other types employ two plano-convex lenses, the curved surfaces being in contact; or two plano-concave lenses. Or it may be a triple combination, the object always being to increase the aperture. The focus must not be so short as to bring the lens too near the light, and render it liable to crack from the intense heat. In recent lanterns is the employment of a thin plate of glass between the condenser and the light. If it be made wide, an iris diaphragm may be introduced so as to eliminate inequalities in illumination.

The function of a magnifier is to produce a magnified inverted image of the picture on the screen. In toy lanterns it is a simple double-convex lens of short focus. This, however, can only produce
a small picture, and that not very distinct at the edges. The best objective is the portrait combination lens usually of the Petzval type as used in ordinary photographic cameras. These are carefully corrected both for spherical and chromatic aberration, which is absolutely essential in the objective, although not so necessary in the condenser.

Objects.—The commonest objects used for exhibiting with the optical lantern are named “slides” and consist of pictures printed on transparent strips of glass. Solid objects mounted on glass after the ordinary manner of mounting microscopic objects are also possible of exhibition, and hollow glass boxes containing organisms or substances undergoing some alteration are also available for use with the lantern. If it be necessary to omit the heat rays which may act deleteriously on the object, a vessel is introduced containing either water or a 5% solution of ferric chloride. In the ordinary slide the pictures are painted with transparent water or oil colours, or photographic emulsion on pieces of glass. If parts of the picture are to be moved, two disks of glass are employed, the one movables in front of the other, the fixed part of the picture being painted on the fixed disk and the movable part on the other. By means of a lever the latter disk is moved in its own plane; and in this way a cow, for instance, can be represented drinking, or a donkey cutting amusing capers.

In the chromatograph slide two circular disks of glass are placed face to face, each containing a design radiating from the centre, and painted with various transparent colours. By a small pinion turning in toothed wheels or endless bands the disks are made to move in opposite directions in their own plane. The effect produced is a singularly beautiful change of design and colour. In astronomical slides the motions of the heavenly bodies, eclipses, phases of the moon or the like are similarly represented by mechanical means.

Dissolving Views.—For this purpose two magic lanterns are necessary, one arranged either side by side or the one on the top of the other. The fronts of the lanterns are slightly inclined to each other so as to make the illuminated disks on the screen to each coincide. By means of a pair of thin metallic shutters terminating in conical fringes, and movable by a rod or lever, the light from each lantern can be gradually cut off at the same time that the light from the other is allowed gradually to fall on the screen. In this way one view appears to melt or dissolve into another. This arrangement was adopted by Child in 1841.

Phantasmagoria.—In this arrangement the pictures on the screen appear gradually to increase or diminish in size and brightness. To effect this a semi-transparent screen of cotton or other material is used, behind which being placed the screen. The lantern is mounted on wheels so that it can be rapidly moved up or withdrawn from the screen; and an automatic arrangement is provided whereby simultaneously with this the object is made to approach or recede from the slide so as to focus the picture on the screen in any position of the lantern. In this way a very small picture appears gradually to grow to enormous dimensions.

See L. Wright, Optical Projection (1871); E. Trutat, Traité des Projections (Paris, 1877 and 1901); P. E. Liesegang, Die Projektions-Kunst (Leipzig, 1909).

LANTERN-FLY, the name given to insects belonging to the homopterous division of the Hemiptera, and referable to the genus Fulgora and allied forms. They are mostly of large size, with a superficial resemblance to lepidoptera due to their brilliant and varied coloration. Characteristic of the group is the presence on the front of the head of a hollow process, simulating a snout, which is sometimes inflated and as large as the rest of the insect, sometimes elongated, narrow and apically upturned. It was believed, mainly on the authority of Marie Siéyé de Mérian, that this process, the so-called “lantern,” was luminous at night. Linnaeus adopted the statement without question and made use of a number of specific names, such as lanternaria, phosphorea, candelaria, &c., to illustrate the supposed fact, and thus aided in disseminating a belief which subsequent observations have failed to establish and which is now generally rejected.

LANTERS OF THE DEAD, the architectural name for the small towers in stone, found chiefly in the centre and west of France, pierced with small openings at the top, where a light was exhibited at night to indicate the position of a cemetery.

These towers were usually circular, with a small entrance in the lower part giving access to the interior, so as to raise the lamps by a pulley to the required height. One of the most perfect in France is that at Cellefron (Charente), which consists of a series of eight attached semicircular shafts, raised on a pedestal, and is crowned with a conical roof decorated with fin conies; it has only one aperture, towards the main road. Other examples exist at Ciron (Indre) and Antigny (Vienne).

LANTHANUM [symbol La, atomic weight 138.90 (O=16)] one of the metals of the cerium group of rare earths. Its name is derived from the Gr. λάνθανειν, to lie hidden. It was first isolated in 1839 by C. G. Mosander from the “cerium” of J. Berzelius. It is found in the minerals gadolinite, cerite, samarskite and fergusonite, and is usually obtained from cerite. For details of the complex process for the separation of the lanthanum salts from cerite, see R. Bunsen (Pogg. Ann., 1875, 155, p. 377); P. T. Cleve (Bull. de la soc. chim., 1874, 21, p. 166); and A. v. Welsbach (Monats. f. Chem., 1884, 5, p. 508). The metal was obtained by Mosander on heating its chloride with potassium, and by W. F. Hillebrand and T. Norton (Pogg. Ann., 1875, 156, p. 466) on electrolysis of the fused chloride, while C. Winkler (Ber., 1879, 23, p. 78) prepared it by heating the oxide with a mixture of magnesium and magnesia. Muthmann and Weiss (Ann., 1904, 331, p. 1) obtained it by electrolyzing the anhydrous chloride. It may be readily hammered, but cannot be drawn. Its specific gravity is 6.1545, and it melts at 810°. It decomposes cold water slowly, but hot water violently. It burns in air, and also in chlorine and bromine, and is readily oxidized by nitric acid.

Lanthanum oxide, La₂O₃, is a white powder obtained by burning the metal in oxygen, or by ignition of the carbonate, nitrate or sulphate. It combines with water with evolution of heat, and on heating with magnesium powder in an atmosphere of hydrogen forms a hydrate of probable composition La₂H₂ (C. Winkler, Ber., 1891, 21, p. 890). Lanthanum hydroxide, La(OH)₃, is a white amorphous powder formed by precipitating lanthanum salts by potassium hydroxide. It decomposes ammonium salts. Lanthanum chloride, LaCl₃, is obtained in the anhydrous condition by heating lanthanum ammonium chloride or, according to C. Matignon (Compt. rend., 1905, 40, p. 1181), by the action of chlorine or hydrochloric acid on the residue obtained by evaporating the oxide with hydrochloric acid. It forms a deliquescent crystalline mass. By evaporation of a solution of lanthanum oxide in hydrochloric acid to the consistency of a syrup, and allowing the solution to stand, large colourless crystals of a hydrated chloride of the composition 2LaCl₃·15H₂O are obtained. Lanthanum sulphide, La₂S₃, is a yellow powder, obtained when the oxide is heated in the vapour of carbon bisulphide. It is decomposed by water, with evolution of sulphurised hydrogen. Lanthanum sulphate, \( \text{La}_2\left(\text{SO}_4\right)_3\cdot9\text{H}_2\text{O} \), forms six-sided prisms, isomorphous with those of the corresponding cerium salt. By careful
LANUVIUM—LAOCOON

heating it may be made to yield the anhydrous salt. Lanthanum nitrate, La(NO₃)₃·6H₂O, is obtained by dissolving the oxide in nitric acid. It crystallizes in plates, and is soluble in water and alcohol. Lanthanum carbonate, La₂CO₃·8H₂O, is prepared by heating the oxide with carbon dioxide gas in an electric furnace (H. Moissan, Compt. rend., 1896, 123, p. 148). It is decomposed by water with the formation of acetonyl, methaney, ethylenic, etc. Lanthanum carbonate, La₂CO₃·8H₂O, occurs as the rare mineral lanthanite, forming greyish-white, pink or yellowish-brown crystals. The atomic weight of lanthanum has been determined by E. Brauner (Proc. Chem. Soc., 1901, 17, p. 63) by ignition of lanthanum sulphate at 500° C, the value obtained being 139 (O = 16).

LANUVIUM (more frequently Lanuvium in imperial times, mod. Civita Latina), an ancient city of Latium, some 19 m. S.E. of Rome, a little S.W. of the Via Appia. It was situated on an isolated hill projecting S. from the main mass of the Alban Hills, and commanding an extensive view over the low country between and the sea. It was one of the members of the Latin League, and remained independent until conquered by Rome in 338 B.C. At first it did not enjoy the right of Roman citizenship, but acquired it later; and even in imperial times its chief magistrate and municipal council kept the titles of dictator and senatus respectively. It was especially famous for its rich and much venerated temple of Juno Sospes, from which Octavian borrowed money in 31 B.C., and the possessions of which extended as far as the sea-coast (T. Ashby in Mélanges de l'école française, 1905, 293). It possessed many other temples, repaired by Antoninus Pius, who was born close by, as was also Commodus. Remains of the ancient theatre and of the city walls exist in the modern village, and above it is an area surrounded by a portico, in opus reticulatum, upon the north side of which is a rectangular building in opus quadratum, probably connected with the temple of Juno. Here terracottas were discovered in excavations carried on by Lord Savile. The acropolis of the primitive city was probably on the highest point above the temple to the north. The neighbourhood, which is now covered with vineyards, contains remains of many Roman villas, one of which is traditionally attributed to Antoninus Pius.

See Notizie degli Scavi, passim. (T. As.)

LANZA, DOMENICO GIOVANNI GIUSEPPE MARIA (1810–1882), Italian politician, was born at Casale, Piedmont, on the 15th of February 1810. He studied medicine at Turin, and practised for some years in his native place. He was one of the promoters of the agrarian association in Turin, and took an active part in the rising of 1848. He was elected to the Piedmontese parliament in that year, and attached himself to the party of Cavour, devoting his attention chiefly to questions of economy and finance. He became minister of public instruction in 1851 in the cabinet of Cavour, and in 1858 minister of finance. He followed Cavour into his temporary retirement in July 1859 after the peace of Villafranca, and for a year (1860–1861) was president of the Chamber. He was minister of the interior (1864–1865) in the La Marmora cabinet, and arranged the transfer of the capital to Florence. He maintained a resolute opposition to the financial policy of Menabrea, who resigned when Lanza was a second time elected, in 1866, president of the Chamber. Lanza formed a new cabinet in which he was himself minister of the interior. With Quintino Sella as minister of finance he sought to reorganize Italian finance, and resigned office when Sella's projects were rejected in 1873. His cabinet had seen the accomplishment of Italian unity and the installation of an Italian government in Rome. He died in Rome on the 9th of March 1882.

See Enrico Tavullini, La Vita ed i tempi di Giovanni Lanza (2 vols., Turin and Naples, 1887).

LANZAROTE, an island in the Atlantic Ocean, forming part of the Spanish archipelago of the Canary Islands (q.v.). Pop. (1900) 11,446; area 1,262 sq. m. Lanzarote, the most easterly of the Canaries, has a length of 31 m. and a breadth varying from 5 to 10 m. It is naked and mountainous, bearing everywhere marks of its volcanic origin. Montaña Blanca, the highest point (2000 ft.), is cultivated to the summit. In 1730 the population of the half island was altered by an volcanic outburst. A violent earthquake preceded the catastrophe, by which nine villages were destroyed. In 1825 another volcanic eruption took place accompanied by earthquakes, and two hills were thrown up. The port of Naos on the south-east of the island affords safe anchorage. It is protected by two forts. A short distance inland is the town of Arrecife (pop. 3082). The climate is hot and dry. There is only a single spring of fresh water on the island, and that in a position difficult of access. From the total failure of water the inhabitants were once compelled to abandon the island. Dromedaries are used as beasts of burden. Teguise (pop. 3786), on the north-west coast, is the residence of the local authorities. A strait about 6 m. in width separates Lanzarote from Fuerteventura.

Graciosa, a small uninhabited island, is divided from the north-eastern extremity of Lanzarote by a channel 1 m. in width, which affords a capacious and safe harbour for large ships; but basaltic cliffs, 1500 ft. high, prevent intercourse with the island. Port Lanzarote. A few persons reside on the little island Algeciras, a mass of lava and cinders ejected at various times from a now extinct volcano, the crater of which has still a well-defined edge.

LANZI, LUIGI (1732–1810), Italian archaelogist, was born in 1732 and educated as a priest. In 1773 he was appointed keeper of the galleries of Florence, and thereafter studied Italian painting and Etruscan antiquities and language. In the one field his labours are represented by his Storia Pictorica della Italia, the first portion of which, containing the Florentine, Sienese, Roman and Neapolitan schools, appeared in 1792, the rest in 1796. The work is translated by Roscoe. In archaeology his great achievement was Saggio di lingua Etrusca (1789), followed by Saggio delle lingue Ital. antiche (1806). In his memoir on the so-called Etruscan vases (Dei vasi antichi dipinti generalmente chiamati Etruschi, 1806) Lanni rightly perceived their Greek origin and characters. What was true of the antiquities would be true also, he argued, of the Etruscan language, and the object of the Saggio di lingua Etrusca was to prove that this language must be related to that of the neighbouring peoples—Romans, Umbrians, Oscans and Greeks. He was allied with E. Q. Visconti in his great but never accomplished plan of illustrating antiquity altogether from existing literature and monuments. His notices of ancient sculpture and its various styles appeared as an appendix to the Saggio di lingua Etrusca, and arose out of his minute study of the treasures then added to the Florentine collection from the Villa Medici. The abuse he met with from later writers on the Etruscan language led Corsen (Sprache der Etrusker, i. p. vi.) to protest in the name of his real services to philology and archaeology. Among his other productions was an edition of Hesiod's Works and Days, with valuable notes, and a translation in terzina rima. Begun in 1785, it was recast and completed in 1808. The list of his works closes with his Opere sacre, a series of treatises on spiritual subjects. Lanni died on the 30th of March 1810. He was buried in the church of the Santa Croce at Florence by the side of Michelangelo.

LAOG, a town, port for coasting vessels, and capital of the province of Ilocos Norte, Luzon, Philippine Islands, on the Laog river, about 5 m. from its mouth, and in the N.W. part of the island. Pop. (1903) 34,454; in 1903, after the census had been taken, the municiapality of San Nicolás (pop. 1903, 10,886) was added to Laog. Laog is on an extensive coast plain, behind which is a picturesque range of hills; it is well built and is noted for its fine climate, the name "Laog," signifying "clear." It is especially well equipped for handling rice, which is shipped in large quantities; Indian corn, tobacco and sugar are also shipped. Cotton is grown in the vicinity, and is woven by the women to subrics, which find a ready sale among the pagan tribes of the mountains. The language is Ilocano.

LAOCOON, in Greek legend a brother of Anchises, who had been a priest of Apollo, but having profaned the temple of the god he and his two sons were attacked by serpents while preparing to sacrifice a bull at the altar of Poseidon, in whose service Laocoon was then acting as priest. An additional motive for
his punishment consisted in his having warned the Trojans against the wooden horse left by the Greeks. But, whatever his crime may have been, the punishment stands out even among the tragedies of Greek legend as marked by its horror—particularly so as it comes to us in Virgil (Aeneid, ii. 199 sq.), and as it is represented in the marble group, the Laocoon, in the Vatican. In the oldest existing version of the legend—that of Arztinus of Miletus, which has so far been preserved in the excerpts of Proclus—the calamity is lessened by the fact that only one of the two sons is killed; and this, as has been pointed out (Arch. Zeitung, 1879, p. 167), agrees with the interpretation which Goethe in his Propyläen had put on the marble group without reference to the literary tradition. He says: “The younger son struggles and is powerless, and is alarmed; the father struggles ineffectively, indeed his efforts only increase the opposition; the elder son is least of all injured, he feels neither anguish nor pain, but he is horrified at what he sees happening to his father, and he screams while he pushes the coils of the serpent off from his legs. He is thus an observer, witness, and participant in the incident, and the work is then complete.” Again, “the gradation of the incident is this: the father has become powerless among the coils of the serpent; the younger son has still strength for resistance but is wounded; the elder has a prospect of escape.” Lessing, on the other hand, maintained the view that the marble group illustrated the version of the legend given by Virgil, with such differences as were necessary from the different limits of representation imposed on the arts of sculpture and of poetry. These limits required a new definition, and this he undertook in his still famous work, Laocoön (see the edition of Hugo Blümner, Berlin, 1876, in which the subsequent criticism is collected). The date of the Laocoön being now fixed (see Ageander) to 40–20 B.C., there can be no question of copying Virgil. The group represents the extreme of a pathetic tendency in sculpture (see Greek Art, Plate I. fig. 52).

LAODICEA, the name of at least eight cities, founded or renovated in the later Hellenic period. Most of them were founded by the Seleucid kings of Syria. Seleucus, founder of the dynasty, is said by Appian to have named five cities after his mother Laodice. Thus in the immense realm of the Seleucidae from the Aegean Sea to the borders of India we find cities called Laodicea, as also Seleucia (q.v.). So long as Greek civilization held its ground, these were the commercial and social centres. The chief are Laodicea ad Lycum (see below); *Combusta* on the borders of Phrygia, Lycaonia and Pisidia; a third in Pontus; a fourth, *ad mare*, on the coast of Syria; a fifth, *ad Libanum*, beside the Lebanon mountains; and three others in the far east—Media, Persia and the lower Tigris valley. In the latter countries Greek civilization was short-lived, and the last three cities disappeared; the other five continued great throughout the Greek and Roman period, and the second, third and fourth retain to the present day the ancient name under the pronunciation Ladiik, Ladikeyh or Latakia (q.v.).

Laodicea ad Lycum (mod. Denizli, q.v.) was founded probably by Antiochus I. Theos (267–246 B.C.), and named after his mother Laodice. Its site is close to the station of Gonteli on the Anatolian railway. It was one of the oldest houses of Christianity, and the seat of one of the seven churches of the Apocalypse. Pliny states (v. 29) that the town was called in older times Diospolis and Rhose; but at an early period Colossae, a few miles to the east, and Hierapolis, 6 m. to the north, were the great cities of the neighbourhood, and Laodicea was of no importance till the Seleucid foundation (Strabo, p. 578). A favourable site was found on some low hills of alluvial formation, about 2 m. S. of the river Lycus (Chiruk Su) and 9 m. E. of the confluence of the Lycus and Maeander. The great trade route from the Ephrataes and the interior passed to it through Apamea. There it forked, one branch going down the Maeander valley to Magnesia and thence north to Ephesus, a distance of about 90 m., and the other branch crossing the mountains by an easy pass to Philadelphia and the Hermus valley, Sardis, Thyatira and at last Pergamum. St. Paul (Col. iv. 15) alludes to the situation of Laodicea beside Colossae and Hierapolis; and the order in which the last five churches of the Apocalypse are enumerated (Rev. i. 11) is explained by their positions on the road just described. Placed in this situation, in the centre of a very fertile district, Laodicea became a rich city. It was famous for its money transactions (Cic. Ad Fam. ii. 17, iii. 5), and for the beautiful soft wool grown by the sheep of the country (Strabo 578). Both points are referred to in the message to the church (Rev. iii. 17, 18).

Little is known of the history of the town. It suffered greatly from a siege in the Mithradatic war, but soon recovered its prosperity under the Roman emperors. The Zeus of Laodicea, with the curious epithet Azeus or Azeus, is a frequent symbol on the city coins. He is represented standing, holding in the extended right hand an eagle, in the left a spear, the *hasta pura*. Not far from the city was the temple of Men Karou, with a great medical school; while Laodicea itself produced some famous Socratic philosophers, and gave origin to the royal family of Ptolemaion and Zenon, whose curious history has been illustrated in recent times (W. H. Waddington, Mélanges de Numism. ser. ii.; Th. Monnissen, Ephém. Épigraph. i. ii. M. G. Rayet, *Milet et le Goûte Latins*, chap. v.). The city fell finally into decay in the frontier wars with the Turkish invaders. Its ruins are of wide extent, but not of great beauty or interest; there is no doubt, however, that much has been buried beneath the debris from the destructions to which the district is exposed (Strabo 580; Tac. Ann. xiv. 27). See W. M. Ramsay, Cities and Biretophics of Phrygia, i. iii. (1895); *Letters to the Seven Churches* (1904); and the beautiful drawings of C. D. F. in *The Antiquities of S. S.* (q.v.).

**LAODICEA, SYNOD OF**, held at Laodicea ad Lycum in Phrygia, some time between 345 and 381 (so Hefele; but Baronius argues for 314, and others for a date as late as 399), adopted sixty canons, chiefly disciplinary, which were declared ecumenical by the council of Chalcedon, 451. The most significant canons are those directly affecting the clergy, wherein the clergy appear as a privileged class, far above the laity, but with sharply differentiated and carefully graded orders within itself. For example, the priests are not to be chosen by the people; penitents are not to be present at ordinations (lest they should hear the failings of candidates discussed); bishops are to be appointed by the metropolitan and his suffragan; sub-deacons may not distribute the elements of the Eucharist; clerics are forbidden to leave a diocese without the bishop's permission. Other canons treat of intercourse with heretics, admission of penitent heretics, baptism, fasts, Lent, angel-worship (forbidden as idolatrous) and the canonical books, from which the Apocrypha and Revelation are wanting. See S. Khansi (693), *Pp. D.*, ii. 777–792; Hefele, 2nd ed., i. 746–777 (Eng. transl. ii. 295–325).

(T. C. F.)

**LAODEMON,** in Greek legend, son of Ilus, king of Troy and father of Podarces (Piram). The gods Apollo and Poseidon served him for hire, Apollo tending his herds, while Poseidon built the walls of Troy. When Laomedon refused to pay the reward agreed upon, Apollo visited the land with a pestilence, and Poseidon sent up a monster from the sea, which ravaged the land. According to the oracle, the wrath of Poseidon could only be appeased by the sacrifice of one of the king's daughters. The lot fell upon Hesione, who was chained to a rock to await the monster's coming. Heracles, on his way back from the land of the Amazons, offered to slay the monster and release Hesione, on condition that he should receive the wonderful horses presented by Zeus to Tros, the father of Ganymede, to console him for the loss of his son. Again Laomedon broke his word; whereupon Heracles returned with a band of warriors, attacked Troy, and slew Laomedon and all his sons except Priam. According to Strabo, Disagones Salams Laomedon avenged his offence by imprisoning Iphiclus and Telamon, who had been sent by Heracles to demand the surrender of the horses. Laomedon was buried near the Scaean gate, and it was said that so long as his grave remained undisturbed, so long would the walls of Troy remain impregnable.

**LAON,** a town of northern France, capital of the department of Aisne, 57 m. N.E. of Paris on the Northern railway. Pop. (1906), town, 9787, commune (including troops) 15,288. It is
situated on an isolated ridge, forming two sides of a triangle, which rises some 330 ft. above the surrounding plain and the little river of Ardon. The suburbs of St. Marcel and Vaux extend along the foot of the ridge to the north. The railway station, situated in the plain to the north, a straight staircase of several hundred steps leads to the gate of the town, and all the roads connecting Laon with the surrounding district are cut in zigzags on the steep slopes, which are crowned by promenades on the site of the old ramparts. The 13th century gates of Ardon, Chenizelles and Soissons, the latter in a state of ruin, have been preserved. At the eastern extremity of the ridge rises the citadel; at its apex is the parade-ground of St Martin, and at the southern end stands the ancient abbey of St Vincent. The deep depression between the arms of the ridge, known as the Cuve St Vincent, has its slopes covered with trees, vegetable gardens and vineyards. From the promenade along the line of the ramparts of Laon itself, and beyond, St Quentin is westward to the forest of St Gobain, and southward over the wooded hills of the Laonnais and Soissons.

The cathedral of Laon (see Architecture, Romanesque and Gothic Architecture in France) is one of the most important creations of the art of the 12th and 13th centuries. It took the place of the old cathedral, burned at the beginning of the communal struggles mentioned below. The building is cruciform, and the choir terminates in a straight wall instead of an apse. Of the six towers flanking the façades, only four complete are to the height of the base of the spires, two at the west front with hugh figures of oxen beneath the arcades of their upper portion, and one at each end of the transept. A square central tower forms a lantern within the church. The west front, with three porches, the centre one surmounted by a fine rose window, ranks next to that of Notre-Dame at Paris in purity. The cathedral has stained glass of the 13th century and a choir grille of the 15th century. The chapter-house and the cloister contain a beautiful specimens of the architecture of the beginning of the 13th century. The old episcopal palace, contiguous to the cathedral, is now used as a court-house. The front, flanked by turrets, is pierced by great pointed windows. There is also a Gothic cloister and an old chapel of two storeys, of a date anterior to the cathedral. The church of St Martin dates from the middle of the 12th century. The old abbey buildings of the same foundation are now used as the hospital. The museum of Laon had collections of sculpture and painting. In its garden there is a chapel of the Templars belonging to the 12th century. The church of the suburb of Vaux near the railway station dates from the 11th and 12th centuries. Numerous cellars of two or three storeys have been taken in the old quarries in the hill-side. Laon forms with La Fère and Reims a triangle of important fortresses. Its fortifications consist of an inner line of works on the eminence of a height of 155 m., an approach of 88,780 sq. m., and a population of about 35,000. Its northern region between the Meckong and the Tongking is covered by a tangle of mountain chains clothed with dense forests and traversed by the Nam-Hou, the Nam-Ta and other tributaries of the Meckong. The culminating point exceeds 6500 ft. in height. South of this is the extensive wooded plateau of Tran-Ninh with an average altitude of between 3000 and 5000 ft. Towards the 18th degree of latitude this mountain system narrows into a range running parallel to and closely approaching the coast of the China Sea as it descends south. The boundary between Laon and Annam follows the crest-line of this range, several peaks of which exceed 6500 ft. (Pu-Atwav, over 8000 ft.). On the west its ramifications extend to the Meckong enclosing wide plains watered by the affluents of that river.

Laos is inhabited by a mixed population falling into three main groups—the Thais (including the Laotians (see below)); various aboriginal peoples classed as Khias; and the inhabitants of neighbouring countries, e.g., China, Annam, Cambodia, Siam, Burma, &c.

Laos has a rainy season lasting from June to October and corresponding to the S.W. monsoon and a dry season coinciding with the N.E. monsoon and lasting from November to May. Both in northern and southern Laos the heat during April and May is excessive, the thermometer reaching 105° F. and averaging 95° F. With the beginning of the rains the heat becomes more tolerable. December, January and February are cool months, the temperature in south Laos (south of 19°) averaging 77°, in north Laos from 56° to 53°. The plateau of Tran-Ninh and, in the south, that of the Bolovens are distinguished by the wholesomeness of their climate.

The forests contain bamboo and valuable woods amongst which only the teak of north Laos and rattan are exploited to any extent; other forest products are rubber, stick lac, gum, balsamin, cardamoms, &c. Rice and maize, and cotton, indigo, tobacco, sugar-cane and various other cultivated plants. Elephants are numerous and the forests are inhabited by tigers, panthers, bears, deer and buffaloes. Hunting and fishing are leading occupations of the inhabitants. Many species of monkeys, as well as peacocks, pheasants and woodcock are found, and the reptiles include crocodiles, turtles, pythons and cobras.

Sacrifice of labour and difficulty of communication hinder
LAOS—LÂO-TSZE

the working of the gold, tin, copper, argentiferous lead, precious stones and other minerals of the country and the industries in general are of a primitive kind and satisfy only local needs. The buffalo, the ox, the horse and the elephant are domesticated, and these together with cardamoms, rice, tobacco and the products of the forests form the bulk of the exports. Siamese are reared, the flesh forming an important article of diet. Imports are inconsiderable, comprising chiefly cotton fabrics, garments and articles for domestic use. Trade is chiefly in the hands of the Chinese and is carried on for the most part with Siam. The Mekong is the chief artery of transit; elsewhere communication is afforded by tracks sometimes passable only for pedestrians. Luang-Prabang (q.v.) is the principal commercial town. Before the French occupation of Laos, it was split up into small principalities (mouangs) of which the chief was that of Vien-Tiane. Vien-Tiane was destroyed in 1828 by the Siamese who annexed the territory. In 1893 they made it over to the French, who grouped the mouangs into provinces. Of these there are twelve each administered by a French commissioner and, under his surveillance, by native officials elected by the people from among the members of an hereditary nobility. At the head of the administration there is a resident-superior stationed at Savannakhet. Up till 1896 Laos had no special budget, but was administered by Cochinchina, Annam and Tongkling. The budget for 1899 showed receipts £28,088 and expenditure £77,417. For 1904 the budget figures were, receipts £82,942, expenditure £76,344. The chief sources of revenue are the direct taxes (£15,606 in 1904), especially the poll-tax, and the contribution from the general budget of Indo-China (£54,990 in 1904). The chief items of expenditure in 1904 were Government house, &c., £21,550; transport, £10,191, native guard, £17,327.

LAOS, or LÀOSTSE, an important division of the widespread Thai or Shan race found throughout Indo-China from 28° N. and the sources of the Irrawaddy as far as Cambodia and 7° N. in the Malay Peninsula. This Thai family includes the Shan proper, and the Siamese. The name Lao, which appears to mean simply "man," is the collective Siamese term for all the Thai peoples subject to Siam, while Shan, said to be of Chinese origin, is the collective Burmese term for those subject to Burma. Lao is therefore rather a political than an ethnical title, and the people cordially dislike the name, insisting on their right to be called Thai. Owing to the different circumstances which have attended their migrations, the Thai peoples have attained to varying degrees of civilization. The Lao, who descend from the mountain-dwelling districts of Yunnan, Szechuan and Kweichow to the highland plains of upper Indo-China, and drove the wilder Kha peoples whom they found in possession into the hills, mostly adopted Buddhism, and formed small settled communities or states in which laws were easy, taxes light and a very fair degree of comfort was attained. There are two main divisions, the Lao Pong Dam ("Black Pauhn Laos"), so-called from their habit of tattooing the body from the waist to the knees, and the Lao Pong Kao ("White Pauhn Laos") who do not tattoo. Lao tattooing is of a most elaborate kind. The Lao Pong Dam now form the western branch of the Lao family, inhabiting the Siamese Lao states of Chieng Mai Lapuan, Tern Pre and Nan, and reaching as far south as 17° N. Various influences have contributed to making the Lao the pleasant, easy-going, idle fellows they are. Pliny noticed the Lao in the time of the Romans. Besides these states is the Laos of Bangkok, Chinese farms, of a certain number of European houses and others, while most of the manual labour connected with the tea industry is done by Ka Mus, who migrate in large numbers from the left bank of the Mekong. The Lao Pong Kao, or eastern branch, appear to have migrated southwards by the more easterly route of the Nam-u and the Mekong valley. In contradistinction to the Lao Pong Dam, who have derived their written language from the Burmese character, the eastern race has retained what appears to be the early form of the present Siamese writing, from which it differs little. They formed important settlements at various points on the Mekong, notably Luang Prabang, Wieng Chan (Vien-Tiane) Ubon and Bassac; and, heading inland as far as Korat or the one side and the Annamite watershed in the east, they drove out the Kha peoples, and even the Cambodians, as far as the Pong Dam did on the west. Vien-Tiane during the 15th century was the most powerful of the Lao principalities, and was feared and respected throughout Indo-China. It was destroyed by the Siamese in 1828. The inhabitants, in accordance with the Indo-Chinese custom of the day, were transported to Lower Siam. The Lao Pong Kao below 18° N. are a less merry and less vivacious people, and are for the most part shorter and more thick-set than those of Luang Prabang and the north. If possible, they are as a race lazier than the western Lao, as they are certainly more musical. The "khen," or mouth organ, which is universal among them, is the sweetest-toned of eastern instruments.

After 1828 the Lao became entirely subject to Siam, and were governed partly by khiao, or native hereditary princes, partly by mandarins directly nominated by the Bangkok authorities. The khiao were invested by a gold dish, betel-box, spittoon and teapot, which were sent from Bangkok and returned at their death or deposition. Of all the khiao the most powerful was the prince of Ubon (15th N., 150° E.), whose jurisdiction extended nearly from Bassac on the Mekong northwards to the great southern bend of that river. Nearly all the Laos country is now divided between France and Siam, and only a few tribes retain a nominal independence.

The many contradictory accounts of the Lao are due to the fact that the race has become much mixed with the aboriginal inhabitants. The half-castes spring from alliances with the wild tribes of Caucasian stock present every variety between that type and the Mongolian. But the pure Lao are still distinguished from the Chinese by their black eyes, lank black hair, rather high forehead, long nose, and strange superstitious belief in werewolves. Their chief food is rice and fish. Men, women and children all smoke tobacco. The civilized Lao were long addicted to slave-hunting, not only with the sanction but even with the co-operation of their rulers, the Lao mandarins heading regular expeditions against the wilder tribes.

Closely allied to the Lao are a number of tribes found throughout the hill regions of the upper Mekong, between Yunnan and Kwangsi in China and the upper waters of the Menam in Siam. They have all within recent times been partners in the general movement towards the south-west from the highland districts of southern China, which has produced so many recruits for the peoples of the Indo-Chinese peninsula. Of this group of people, among whom may be named the Yao, Yao Yin, Lanten, Meo, Musur (or Muso) and Kaw, perhaps the best known and most like the Lao are the Lui—both names meaning originally "man"—and who in many cases adopted a form of Buddhism (flavoured strongly by their natural respect for local spirits as well as tattooing) and other relatively civilized customs, and have forsaken their wandering life among the hills for a more sedentary existence, and have, with the exception of music, kind-hearted, and with a strangely artistic taste in dress, these people possess in a wonderful degree the secret of cheerful contentment.

LÀO-TSZE, or LAU-TSE, the designation of the Chinese author of the celebrated treatise called Tao Teh King, and the reputed founder of the religion called Taoism. The Chinese
LÃO-TSZE

characters composing the designation may mean either “the Old Son,” which commonly assumes with foreigners the form of “the Old Boy,” or “the Old Philosopher.” The latter significance is attached to it by Dr Chalmers in his translation of the treatise published in 1868 under the title The Speculations on Metaphysics, Policy and Morality of “the Old Philosopher,” Lão-tsze. The former is derived from a fabulous account of Lão-tsze. In the China Memoirs: The Account of Spirits and the Remains of Mortants of Ko Hung, in the Sze-ma Ch’ien 4th century A.D. Account of this, his mother, after a supernatural conception, carried him in her womb sixty-two years (or seventy-two, or eighty-one—ten years more or fewer are of little importance in such a case), so that, when he was born at last, his hair was white as with age, and people might well call him “the old boy.” The other meaning of the designation rests on better authority. We find it in the Kià Yü, or “Narratives of the Confucian School,” compiled in the 3rd century B.C. from documents said to have been preserved among the descendants of Confucius, and also in the brief history of Lão-tsze given in the historical records of Sze-ma Ch’ien (about 100 B.C.). In the latter instance the designation is used by Confucius, and possibly it originated with him. It should be regarded more as an epithet of respect than of years, and is equivalent to “the Venerable Philosopher.”

All that Ch’ien tells us about Lão-tsze goes into small compass. His surname was Li, and his name Yü. He was a native of the state of Ch’in, and was born in the year of the first day of the 19th year of the reign of King Hsiao of the state of Ch’in, 479 B.C. He was born in the city of Kwei-té in Ho-nan province. He was one of the recorders or historiographers at the court of Chow, his special department being the charge of the whole or a portion of the royal library. He must thus have been able to make himself acquainted with the history of his country. Ch’ien does not mention the year of his birth, which is often said, though on what Chinese authority does not appear, to have taken place in the 3rd year of King Pin, corresponding to 604 B.C. That date cannot be far from the truth. That he was contemporary with Confucius is established by the concurrent testimony of the Li Ki and the Kià Yü on the Confucian side, and of Chwang-tsze and Sze-ma Ch’ien on the Taoist. The two men whose interests overlapped, on all the questions germane to the Chinese people—Kung-tsze (Confucius) and Lão-tsze—had at least one interview, in 517 B.C., when the former was in his thirty-fifth year. The conversation between them was interesting. Lão was in a listening mood, as Lão who wrote fifteen treatises (or wards) be true that Confucius, when he was fifty-one years old, visited Lão-tsze as Chwang-tsze says (in the Thien Yun, the fourteenth of his treatises), to ask about the Tao, they must have had more than one interview. Dr Chalmers, in his translation of the Lão-tsze, has pointed out the meetings between the two in 517 B.C., but we have no evidence that they were together in the same place at that time. Ch’ien adds: “Lão-tsze cultivated the Tao and virtue, his chief aim in his studies being to keep himself concealed and unknown, and when (the capital of) Chow; but after a long time, seeing the decay of the dynasty, he left it, and went away to the Gate (leading from the royal domain into the regions beyond—at the entrance of the pass of Oi-k, in the north-west of Ho-nan) Yin Hsi, the owner of the Gate, said to him, ‘You are about to withdraw yourself out of sight; I pray you to compose for me a book (before you go).’ On this Lão-tsze made a writing, setting forth his views on the Tao and Virtue, containing a hundred and eighty-one chapters. He then went away, and it is not known where he died.” The historian then mentions the names of two other men whom some regarded as the true Lão-tsze. One of them was a Lão Lài, a contemporary of Lão-tsze who wrote five treatises or wards of the practices of the school of Tao. Subjoined to the notice of him is the remark that Lão-tsze was more than one hundred and sixty years old, or, as some say, much more than two hundred, because by the calculation of the Tao he had nourished his longevity by the method of the grand historiographer” of Chow, called Tan, one hundred and twenty-nine (? one hundred and nineteen) years after the death of Confucius. The introduction of these disjointed notices detracts from the precision of the statement that we who are the modern translators of the Lao-tzu were the real Lao-tzu in whom they occur.

Finally, Ch’ien states that “Lão-tsze was a superior man, used to keep in obscurity,” traces the line of his posterity down to the 2nd century B.C., and concludes with this important statement: “This shows that the Lão-tsze we are here to discuss is the same Lão-tsze of the Tao, that of the literati, and the literati on their part condemn Lão-tsze, thus verifying the saying. ‘Parties whose principles are different cannot take counsel together.’ Li Urh taught that transformation follows, as a matter of course, the doing nothing (to bring it about), and rectification ensues in the same way from being pure and still.

Accepting the Tāo Teh King as the veritable work of Lão-tsze, we may now examine its contents. Consisting of not more than between five and six thousand characters, it is but a short treatise—not half the size of the Gospel of St Mark. The nature of the subject, however, the want of any progress of thought or of logical connexion between its different parts, and the condensed style, with the mystic tendencies and poetical temperament of the author, makes its meaning extraordinarily obscure. Instead of being divided into two parts, it has subsequently and conveniently been subdivided into chapters. One of the oldest, and the most common, of these arrangements makes the chapters eighty-two.

Some Roman Catholic missionaries, two centuries ago, fancied that they found a wonderful harmony between many passages and the teaching of the Bible. Montuccii of Berlin ventured to say in 1806: “Many things about a Triune God are so clearly expressed that no one who has read this book can doubt that the mystery of the Holy Trinity was revealed to the Chinese five centuries before the coming of Jesus Christ.” Even Rémusat, the first occupant of a Chinese chair in Europe, published at Paris in 1823 his Mémoire sur la vie et les opinions de Lão-tsze, to vindicate the view that the Hebrew name Yahweh was phonetically represented in the fourteenth chapter by Chinese characters. The theories were exploded by Stanislas Julien, when he issued in 1842 his translation of the whole treatise as Le Livre de la vie et de la vertu.

The most important thing is to determine what we are to understand by the Tāo, for Tēh is merely its outcome, especially in man, and is rightly translated by “virtue.” Julien translated Tāo by “la voie.” Chalmers leaves it untranslated. “No English word,” he says (p. xi), “is its exact equivalent. Three terms suggest themselves—the way, reason and the word; but they are all liable to objection. We were guided by etymology, the ‘way’ would come nearest the original, and in one or two passages the idea of a way seems to be in the term; but this is too materialistic to serve the purpose of a translation. ‘Reason,’ again, seems to be more like a quality or attribute of some conscious being than Tāo is. I would translate it by ‘the Word,’ in the sense of the Logos, but this would be like setting the question which I wish to leave open, viz. what resemblance there is between the Logos of the New Testament and this Chinese Tāo.” Later Sinologues in China have employed “nature” as our best analogue of the term. Thus Watters (Lão-tsze, A Study in Chinese Philosophy, p. 45) says: “In the Tāo Teh King the originator of the universe is referred to under the names Non-Existence, Existence, Nature (Tāo) and various designations—all which, however, represent one idea in various manifestations. It is in all cases Nature (Tāo) which is meant.” This view has been skillfully worked out; but it only hides the scope of “the Venerable Philosopher.” “Nature” cannot be accepted as a translation of Tāo. That character was, primarily, the symbol of a way, road or path; and then, figuratively, it was used, as we also use way, in the senses of means and method—the course that we pursue in passing from one thing or concept to another as its end or result. It is the name of a river, of a road, of a path. Sir Richard Douglas has well said (Confucianism and Taoism, p. 189): “If we were seduced to adopt a single word to represent the Tāo of Lão-tsze, we should prefer the sense in which it is used by Confucius, ‘the way, that is, µήδος.”

What, then, was the quality which Lão-tsze had in view, and which he thought of as the Tāo—there in the library of Chow, at the pass of the valley of Han, and where he met the end of his life beyond the limits of the civilized state? It was the simplicity of spontaneity, action (which might be called non-action) without motive, free from all selfish purpose, resting in nothing but its own accomplishment. This is found in the phenomena of the material world. “All things spring up without a word spoken, and grow without a claim for their production. They go through their processes without any display of pride in them; and the results are realized without any assumption of ownership. It is owing to the absence of such assumption that the results and their
processes do not disappear" (chap. ii.). It only needs the same quality in the arrangements and measures of government to make society beautiful and happy. "A government conducted by sages would free the hearts of the people from inordinate desires, fill their bellies, keep their ambitions Feeble and strengthen their bones. They would constantly keep the people without knowledge and free from desires; and, where there were those who had knowledge, they would have them so that they would not dare to put it in practice" (chap. iii.). A corresponding course observed by individual man in his government of himself becoming again "as a little child" (chaps. x. and xxviii.) will have corresponding results. "His constant virtue will be complete, and he will return to the primitive simplicity" (chap. xxviii.).

Such is the subject matter of the Tâo Teh King—the operation of things melodious or Tâo, "without striving or crying" in nature, in society and in the individual. Much that is very beautiful and practical is incalculated in connexion with its working in the individual character. The writer seems to feel that he cannot say enough on the virtue of humility (chap. viii., &c.). There were three things which he prized and held fast—gentle compassion, economy and the not presuming to take precedence in the world (chap. lxvii.). His teaching rises to its highest point in chap. lxxii.:— "It is the way of Tâo not to act from any personal motive, to conduct affairs without feeling the trouble of them, to taste without being aware of the flavour, to account the great as small and the small as great, to recompense injury with kindness." This last and noblest characteristic of the Tâo, the requiring "good for evil," is not touched on again in the treatise; but we know that it excited general attention at the time, and was the subject of conversation between Confucius and his disciples (Confucian Analects, xiv. 36).

What is said in the Tâo on government is not, all of it, so satisfactory. The writer shows, indeed, the benevolence of his heart. He seems to condemn the infliction of capital punishment (chaps. lxxiii. and lxxiv.), and he deplores the practice of war (chap. lxxiv.); but he had no sympathy with the progress of society or with the culture and arts of life. He says (chap. lxv.):— "Those who anciently were skilful in practising the Tâo did not use it to enlighten the people; their object rather was to keep them simple. The difficulty in governing the people arises from their having too much knowledge; and therefore he who tries to govern a state by wisdom is a scourge to it, while he who does not strive to govern is a blessing. There is a ninth chapter but one is the following:— "In a small state with a few inhabitants, I would so order it that the people, though supplied with all kinds of implements, would not (care to) use them; I would give them cause to look on death as a most grievous thing, while yet they would not go away to a distance to escape from it. Though they had boats and carriages, they should have no occasion to ride in them. Though they had buff-coats and sharp weapons, they should not don or use them. I would make them return to the use of knotted cords (instead of written characters). They should think their coarse food sweet, their plain clothing beautiful, their poor houses places of rest and their common simple ways sources of enjoyment. There should be a neighbouring state within sight, and the sound of the beds and the goats and the vessels afar; but a man should go from it, to us, without interruption, but I would make the people to old age, even to death, have no intercourse with it."

On reading these sentiments, we must judge of Lâo-tse that, with all his power of thought, he was only a dreamer. But thus far there is no difficulty arising from his language in regard to the Tâo. It is simply a quality, descriptive of the style of character and action, which the individual should seek to attain in himself, and the ruler to impress on his administration. The language about the Tâo in nature is by no means so clear. While Sir Robert Douglas says that "the way" would be the best translation of Tâo, he immediately adds:— "But Tâo is more than the way. It is the way and the way-goer. It is an eternal road; along it all beings and things walk; but no being waite it, for it is being itself; it is everything, and nothing and the cause and effect of all. All things originate from Tâo conform to Tâo and to Tâo at last they return."

Some of these representations require modification; but no thoughtful reader of the treatise can fail to be often puzzled by what is said on the point in hand. Julien, indeed, says with truth (p. xii.) that "it is impossible to take Tâo for the primordial Reason, for the sublime Intelligence, which has created and governs the world"; but many of Lâo-tse's statements are unthinkable if there be not behind the Tâo the unexpressed recognition of a personal creator and ruler. Granted that he does not affirm positively the existence of such a Being, yet certainly he does not deny it, and his language even implies it. It has been said, indeed, that he denies it, and we are referred in proof to the fourth chapter: "Tâo is the emptiness of a vessel; and the use of it, we may say, must be free from all self-sufficiency. How deep and mysterious it is, as if it were the author of all things! We should make our sharpness blunt, and unravel the complications of things; we should attemper our brightness, and assimilate ourselves to the obscurity caused by dust. How still and clear is Tâo, a phantom with the semblance of permanence! I do not know whose son it is. It might appear to have been before God (Tâo)."

The reader will not overlook the cautious and dubious manner in which the predicates of Tâo are stated in this remarkable passage. The author does not say that it was before God, but that "it might appear" to have been so. Nowhere else in his treatise does the nature of Tâo as a metaphysical or first style of all; the Trinity, with the sublimity of the vacuum that has no positive existence of itself; it is but like the emptiness of a vessel, and the manifestation of it by men requires that they endeavour to free themselves from all self-sufficiency. Whence came it? It does not shock Lâo-tse to suppose that it had a father, but he cannot tell whose son it is. And, as the feeling of its mysteriousness grows on him, he ventures to say that "it might appear to have been before God."

There is here no denial but express recognition of the existence of God, so far as it is implied in the name Tâo, which is the personal name for the concept of heaven as the ruling power, by means of which the fathers of the Chinese people rose in prehistoric time to the idea of God. Again and again Lâo-tse speaks of heaven just as "we do when we mean thereby the Deity who presides over heaven and earth." These last words are taken from Watters (p. 81); and, though he adds, "We must not forget that this heaven is inferior and subsequent to the mysterious Tâo, and was in fact produced by it," it has been shown how rash and unwarranted is the ascription of such a sentiment to "the Venerable Philosopher." He makes the Tâo prior to heaven and earth, which is a phrase denoting what we often call "nature," but he does not make it prior to heaven in the higher and immaterial usage of that name. The last sentence of his treatise is:— "It is the Tâo—the way—of Heaven to benefit and not injure; it is the Tâo—the way—of the sage to do and not to strive."

Since Julien laid the Tâo Teh King fairly open to Western readers in 1842, there has been a tendency to overestimate rather than to underestimate its value, its contribution to the individual and society. There are in it lessons of unsurpassed value, such as the inculcation of simplicity, humility and self-abnegation, and especially the brief enumeration of the divine duty of returning good for ill; but there are also the regrettable representations of a primitive society when men were ignorant of the rudiments of culture, and the longings for its return.

When it was thought that the treatise was known, the doctrine of one Trinity, and even the name of Trinity, was a phonetic representation of the Hebrew name for God, it was natural, even necessary, to believe that its author had had communication with more western parts of Asia, and there was much speculation about visits to India and even to Greece, the necessity for assuming such travels has passed away. If we can receive Sze-mâ Chi'en's histories as trustworthy, Lâo-tse might have heard, in the states of Chow and among the wild tribes adjacent to them, views about society and government very like his own. Chi'en relates how an envoy came in 624 B.C.—twenty years before the date assigned to the birth of Lâo-tse—to the court of Duke Mu of Ch'in, sent by the king of some rude hordes on the west. The duke told him of the histories

Tâo in the Deity.
poems, codes of rites, music and laws which they had in the middle states, while yet rebellion and disorder were of frequent occurrence, and asked how good order was secured among the wild people, who had none of those appliances. The envoy smiled, and replied that the secret of it all lay in the occasion that very morning when the Bu ren, the duke vaunted, and that there had been a gradual degenera-
tion in the condition of its states, as their profession civilization had increased, ever since the days of the ancient sage; Hwang Ti, whereas in those days it is said that there were no laws but for the want of simplicity, their princes showed a pure virtue in their treatment of the people, who responded to them with loyalty and good faith. "The government of a state," said he in conclusion, "is like a man’s ruling his state, and all goes well with him now he has set it on its feet; and this was indeed the method of the sages." Liao-tse did not need to go further afield to find all that he has said about government.

We have confined ourselves to the Taoism of the Tso Tch’ing, without touching on the religion Taoism now existing in China, but which did not take shape until more than five hundred years after the death of Liao-tse, though he now occupies the second place in its trinity of "The Three Pure or Holy Ones. There is hardly a word in his treatise that either refuse or superstition. In the works of Lieh-tse and Chwang-tse, his earliest followers of note, we find abundance of grotesque superstitions; but their beliefs (if indeed we can say that there be such) are incomparably less refined than many religious institu-
tions. When we come to the Ch’in dynasty (221-206 B.C.) we meet with a Taoism in the shape of a search for the fairy islands of the eastern sea, where the herb of immortality might be gathered. In the following centuries, Buddhism, Confucianism, and Mohism, in short, were treated by us as the chief professor and controller of this Taoism, preparing in retirement the "pill" which renewed his youth, supreme over all spirits, and destroying millions of demons by a stroke of his pencil. He used potions for the dead, talismans, charms and oaths, with his own hand and seal to his descendants, and one of them, professing to be animate by his soul, dwells on the Lung-hu mountain in Kiang-si, the acknowledged head or pope of Taoism. But even then the system was not yet a religion, with the rituals and ceremonies that compose and ordain it to men’s worship. It borrowed all these from Buddhism, which first obtained public recognition in China between A.D. 65 and 70, though at least a couple of centuries passed before it could be said to have free course in the country.

Even still, with the form of a religion, Taoism is in reality a conglomeration of base and dangerous superstitions. Alchemy, geomancy and spiritualism have dwelt and dwell under its shadow. Each of its three "Holy Ones" has the title of Tien Tsun, "the Heavenly and Honoured," taken from Buddhism, and also of Shang Ti or God, taken from the old religion of the country. The most popular deity, however, is not one of them, but has the title of Yi Wang Shang Ti, "God, the Perfect King." But it would take long to tell of all its "glossing gods," "godheads," "divine rulers" and others. It has been doubted whether Liao-tse acknowledged the existence of God at all, but modern Taoism is a system of the wildest polytheism. The science and religion of the West meet in it, and its enunciation of "The Way" is an old and well-tried maxim, which himself would not have welcomed; but he ought not to bear the obloquy of being the founder of the Taisho religion. (J. L.E.)

LA PAZ, a western department of Bolivia, bounded N. by the national territories of Caupolican and El Beni, E. by El Beni and Cochabambns, S. by Cochabamba and Oruro and W. by Chile and Peru. Pop. (1900) 445,016, the majority of whom are Indians. Area 53,777 sq. m. The department belongs to the great Bolivian plateau, and its greater part to the cold, bleak, puna climatic region. The Cordillera Real crosses it N.W. to S.E. and culminates in the snow-crowned summits of Seatitaca, 22,287 ft. above sea-level, which perhaps is a part of the Titicaca basin with about half of the lake. This elevated plateau region is partially barren and inhospitable, its short, cold summers permitting the production of little besides potatoes, quinoa (Chenopodium quinoa) and barley, with a little Indian corn and wheat in favoured localities. Some attention is given to the rearing of llamas, and a few cattle, sheep and mules to be seen south of Lake Titicaca. There is a considerable Indian population in this region, living chiefly in small hamlets on the products of their own industry. In the lower valleys of the eastern slopes, where climatic conditions range from temperate to tropical, wheat, Indian corn, oats and the fruits and vegetables of the temperate zone are cultivated. Farther down, coffee, cacao, cocoa, rice, sugar cane, tobacco, oranges, bananas and other tropical fruits are grown, and the forests yield cincunha bark and rubber. The mineral wealth of La Paz includes gold, silver, tin, copper and bismuth. Tin and copper are most important of these. The principal tin mines being in the vicinity of the capital and known under the names of Huayna-Potosi, Milluni and Chocoaltaga. The chief copper mines are the famous Corocono group, about 75 m. S.S.E. of Lake Titicaca by the Desaguadero river, the principal means of transport. The output of the Corocono mines, which also includes gold and silver, finds its way to market by boat and rail to Mollendo, and by pack animals to Tacna and rail to Arica. There are no roads in La Paz worthy of the name except the 5 m. between the capital and the "Alto," though stage-coach communication with Oruro and Chililaya has been main-
tained by the national government. The railway opened in 1905 between Guaquí and La Paz (54 m.) superseded the latter of these stage lines, and a railway is planned from Vichu to Oruro to supersede the other. The capital of the department is the national capital La Paz. Corocono, near the Desaguadero river, about 75 m. S.S.E. of Lake Titicaca and 13,333 ft. above sea-level, has an estimated population (1906) of 13,000, chiefly Aymar Indians. LA PAZ (officially LA PAZ DE AYACUCHO), the capital of Bolivia since 1808, the see of a bishopric created in 1605 and capital of the department of La Paz, on the Rio de la Paz or Río Chuquiapo, 42 m. S.E. of Lake Titicaca (port of Chililaya) in 16° 30’ S., 68° W. Pop. (1900) 54,713, (1906) estimate 67,235. The city is built in a deeply-eroded valley of the Cordillera Real which is believed to have formed an outlet of Lake Titicaca, and at this point descends sharply to the S.E., the river making a great bend southwards and then flowing northwards to the Beni. The valley is about 10 m. long and 3 m. wide, and is singularly barren and forbidding. Its precipitous sides, deeply gulleyed by torrential rains and diversely coloured by mineral ores, rise 1500 ft. above the city to the margin of the great plateau surrounding Lake Titicaca, and above these are the snow-capped summits of Illimani and other giants of the Bolivian Cordillera. Below, the valley is fertile and covered with vegetation, first of the temperate and then of the tropical zone. The elevation of La Paz is 12,120 ft. above sea-level, which places it within the puna climatic region, in which the summers are short and cold. The mean annual temperature is a little above the puna average, which is 54° F., the extremes ranging from 10° to 75°. Pneumonia and bronchial complaints are common, but consumption is said to be rare. The surface of the valley is very uneven, rising sharply from the river on both sides, and the transverse streets of the city are steep and irregular. At its south-eastern extremity is the Alameda, a handsome public promenade with parallel rows of exotic trees, shrubs and flowers, which are maintained with no small effort in so inhospitable a climate. The trees which seem to thrive best are the willow and eucalyptus. The streets are generally narrow and roughly paved, and there are numerous bridges across the river and its many small tributaries. The dwellings of the poorer classes are commonly built with mud walls and covered with tiles, but stone and brick are used for the better structures. The cathedral, which was begun in the 17th century when the mines of Potosí were at the height of their productivity, was finished in 1760 and is the finest church in South America, save the westerly point of the city under the republic. It faces the Plaza, Mayor and is distinguished for the finely-carved stonework of its façade. Facing the same plaza are the government offices and legislative chambers. Other notable edifices and institutions are the old university of San Andrés, the San Francisco church, a national college, a seminary, a great public library and a museum rich in relics of the Inca and colonial periods. La Paz is an important commercial centre, being connected with the Pacific coast by the Peruvian railway from Mollendo to Puno (via Arequipa), and a Bolivian extension from Guaquí to the Alto de La Paz (Heights of La Paz)—the two lines being connected by a steamship service across Lake Titicaca. An electric railway 5 m. long connects the Alto de La Paz with the city, 1493 ft. below. This route is 406 m. long, and is expensive because of trans-shipments and the cost of handling cargo at Mollendo. The vicinity of La Paz abounds with mineral wealth; most important are the tin deposits of Huayna-Potosi, Milluni.
and Choluteca. The La Paz valley is auriferous, and since the foundation of the city gold has been taken from the soil washed down from the mountain sides.

La Paz was founded in 1548 by Alonso de Mendoza on the site of an Indian village called Choluteca. It was called the Pedro Nuevo de Nuestra Señora de la Paz in commemoration of the reconciliation between Pizarro and Almagro, and soon became an important colony. At the close of the war of independence (1825) it was nominally called La Paz de Avacucho, in honour of the last decisive battle of that protracted struggle. It was made one of the four capitals of the republic, but the revolution of 1898 permanently established the seat of government here because of its accessibility, wealth, trade position, and political importance.

LA PÉROUSE, JEAN-FRANÇOIS DE GALAUP, Comte de (1741–1788). French navigator, was born near Albi, on the 22nd of August 1741. His family name was Galaup, and La Pérouse or La Peyrouse was an addition adopted by himself from a small family estate near Albi. As a lad of eighteen he was wounded and made prisoner on board the “Formidable” when it was captured by Admiral Hawke in 1759; and during the war with England between 1778 and 1783 he served with distinction in various parts of the world, more particularly on the eastern coasts of Canada and in Hudson’s Bay, where he captured Forts Prince of Wales and York (August 8th and 21st, 1782). In 1785 (August 1st) he sailed from Brest in command of the French government expedition of two vessels (“La Boussole” under La Pérouse himself, and “L’Astrolabe,” under de Langle) for the discovery of the North-West Passage, vainly essayed by Cook on his last voyage, from the Pacific side. He was also charged with the further exploration of the north-west coasts of America, and the north-east coasts of Asia, of the China and Japan seas, the Solomon Islands and Australia; and he was ordered to collect information as to the whale fishery in the southern oceans and as to the fur trade in North America. He reached Mount St Elias, on the coast of Alaska, on the 23rd of June 1786. After six weeks, marked by various small discoveries, he was driven from these regions by bad weather; and after visiting the Hawaiian Islands, and discovering Necker Island (November 5th, 1786), he crossed over to Asia (Macao, January 3rd, 1787). Thence he passed to the Philippines, and so to the coasts of Japan, Korea and “Chinese Tartary,” where his best results were gained. Touching at Quelpart, he reached De Castries Bay, near the modern Vladivostok, on the 28th of July 1787; and on the 2nd of August following discovered the strait, still named after him, between Sakhalin and the Northern Island of Japan. On the 7th of September he put in at Petrovskov in Kamchatka, where he was well received by special order of the Russian empress, Catherine II.; thence he sent home Lesseps, overland, with the journals, notes, plans and maps recording the work of the expedition. He left Avacha Bay on the 29th of September, and arrived at Macao in the Samoan group on the 8th of December; here de Langle and ten of the crew of the “Astrolabe” were murdered. He quitted Samoa on the 14th of December, touched at the Friendly Islands and Norfolk Island and arrived in Botany Bay on the 26th of January 1788. From this place, where he-interchanged courtesies with some of the English pioneers in Australia, he wrote his last letter to the French Ministry of Marine (February 7th). After this no more was heard of him and his squadron till in 1826 Captain Peter Dillon found the wreckage of what must have been the “Boussole” and the “Astrolabe” on the reefs of Vanikoro, an island to the north of the New Hebrides. In 1828 Dumont d’Urville visited the scene of the disaster and erected a monument (March 14th).

LAPIDARY, and GEM CUTTING (Lat. lapidarius, lapis, a stone). The earliest examples of gem cutting and carving known (see also Gem) are the ancient engraved seals which are of two principal types, the cylindrical or “rolling” seals of Babylonia and Assyria, suggested by a joint of the bamboo or the central whorl of a conch-like shell, and the peculiar scarabaeoid seals of Egypt. Recent researches make it appear that both these types were in use as far back as 4500 b.c., though with some variations. The jewels of Queen Zer, and other jewels consisting of cut turquoise, lapis lazuli and amethyst, found by the French mission, date from 4777 B.C. to 4515 B.C. Until about 2500 B.C., the cylinder seals bore almost wholly animal designs; then cuneiform inscriptions were added. In the 6th and 5th centuries B.C., the scarabaeoid type was introduced from Egypt, while the rolling seals began to give place to a new form, that of a tall cone. These, in the 1st century B.C., were gradually shortened; the hole by which they were suspended was enlarged until it could admit the finger, and in time they passed into the familiar form of seal-rings. This later type, which prevailed for a long period, usually bore Persian or Sassanian inscriptions. The scarabaeoid seals were worn as rings in Egypt apparently from the earliest times.

The most ancient of the cylinder seals were cut at first from shell, then largely from opaque stones such as diorite and serpentine. After 2500 B.C., varieties of chalcedony and milky quartz were employed, translucent and richly coloured; sometimes even rock crystal, and also frequently a beautiful compact haematite. Amazone stone, amethyst and fossil coral were used, but no specimen is believed to be known of ruby, sapphire, emerald, diamond, tourmaline or spinel.

The date of about 300 B.C. marks the beginning of a period of great artistic taste and skill in gem carving, which extended throughout the ancient civilized world, and lasted until the 3rd or 4th centuries A.D. Prior to this period, all the work appears to have been done by hand with a sapphire point, or else with a bow-drill; thenceforward the wheel came to be largely employed. The Greek cutters, in their best period, the 5th and 6th centuries B.C., knew the use of disks and drills, but preferred the sapphire point for their finest work, and continued to use it for two or three hundred years. Engraving by the bow-drill was introduced in Assyrian and Babylonian work as early as perhaps 3000 B.C., the earlier carving being all done with the sapphire point, which was secured in a handle for convenient application. This handwork demanded the utmost skill and delicacy of touch in the artist. The bow-drill consisted of a similar point fastened in the end of a stick, which could be rotated by means of a horizontal cross-bar attached at each end to a string wound around the stick; as the cross-bar was moved up and down, the stick was made to rotate alternately in opposite directions. This has been a frequent device for such purposes among many peoples, both ancient and modern, civilized and uncivilized. The point used by hand, and the bow-drill, were afterwards variously combined in executing such work. Another modification was the substitution for the point, in either process, of a hollow tube or drill, probably in most cases the joint of a hollow reed, whereby very accurate circles could be made, as also crescent figures and the like. This process, used with fine hard sand, has also been widely employed among many peoples. It may perhaps have been suggested by the boring of other shells by carnivorous molluscs of the Murex type, examples of which may be picked up on any sea-beach. It is possible that the cylinder seals were drilled in this way out of larger pieces by means of a hollow reed or bamboo, the cylinder being left as the core.

The Egyptian scarabs were an early and very characteristic type of seal cutting. The Greek gem cutters modified them by adding Greek and Etruscan symbols and talismanic signs; many of them also worked in Egypt and for Egyptians. Phoenician work shows a mixture of Assyrian and Egyptian designs; and Cypriote seals, principally on the agate gems, are known that are referred to the 9th century B.C.

Scarabs are sometimes found that have been sliced in two, and the new flat faces thus produced carved with later inscriptions and set in rings. This secondary work is of many kinds. An Assyrian cylinder in the Metropolitan Museum, New York, referred to 3000 B.C., bears such a cutting of Mediterranean
LAPIDARY, AND GEM CUTTING

character, the 2nd or 3rd century B.C. In the early Christian era, also, many Greek and Roman gems were cut with Gnostic and other peculiar and obscure devices.

In the later Roman period, the 3rd and 4th centuries, a great decline in the art is seen—so great that Castellani terms it “the idiotic age.” Numbers of gems of this kind have been found together, as though they were the product of a single manufacturer, carved in the crudest manner, both in design and execution. Yet remarkable results are sometimes produced in these by a few touches of the drill, which under the glass appear very crude but nevertheless yield strong effects. The same thing may be seen now in many of the Japanese sketches and lacquer designs, where a whole landscape is depicted, or rather suggested, by a few simple but powerful strokes. It is now thought that some of these seals may be of earlier origin than has been supposed, and also that they may have been worn by the poorer classes, who could not afford the more finished work. They must have been made by the hundred thousand. The decline of the art went on until in the Byzantine period, especially the 6th century, it had reached a very low point. Most of the gems of this period show drill-work of poor quality, although hand-work is occasionally seen.

With the Renaissance, the art of gem carving revived, and the engravers from that time and onward have produced results that equal the best Greek and Roman work; copies of ancient gem carvings made by some of the 18th-century masters are only distinguishable from true antiques by experts of great proficiency. It is in fact extremely difficult to judge positively as to the age of engraved gems. The materials of which they are made are hard and resistant to any change through time, and there are many ingenious devices for producing the appearances usually believed to indicate great age, such as slightly dulled or scratched surfaces and the like. There are also the gems with secondary carving, already alluded to, and the ancient gem engraving has been recut by modern engravers for the purpose of fraudulently enhancing their price. All these elements enter into the problem and make it an almost hopeless one for any but a person of great experience in the study of such objects; and even he may not be able in all cases to decide.

Until the 14th century, almost all the gems were cut en cabochon—that is, smoothly rounded, as carbuncles and opals are still—or else in the form of beads drilled from both sides for suspension or attachment, the two perforations often meeting but imperfectly. These latter may be of Asiatic origin, brought into Europe by commerce during the Crusades. Some of the finest gems in the Austrian, Russian and German crowns are stones of this perforated or bead type. An approach, or transition, to the modern faceting is seen in a style of cutting often used in rock-crystal in the 15th and 16th centuries: an oval cabochon was polished flat, and the sides of the dome were also trimmed flat, with a rounded back, and the upper side with a ridge running in the center, tapering off to the origin of the product.

The plane faceted cutting is altogether modern; and hence the pictures which represent the breastplastr of the ancient Jewish high-priest as set with faceted stones are wholly imaginary and probably incorrect, as we have no exact knowledge of the forms of the gems. The Orientals polish gems in all sorts of irregular, rounded shapes, according to the form of the piece as found, and with the one object of preserving as much of its original size and colour as possible. The greatest ingenuity is used to make a speck of colour, as in a sapphire, tone up an entire gem, by cutting it so that there is a point of high colour at the lower side of the gem.

In later times a few facets are sometimes cut upon a generally rounded stone. The cabochon method is still used for opaque or translucent stones, as opal, moonstone, tournquoise, carbuncle, &c.; but for transparent gems the faceted cutting is almost always employed, on account of its fine engraving for the purpose of fraudulently enhancing their price. All these elements enter into the problem and make it an almost hopeless one for any but a person of great experience in the study of such objects; and even he may not be able in all cases to decide.

We may now review some of the special forms of cutting and working gems and ornamental stones that have been developed in Europe since the period of the Renaissance.

Garnets (g.r.) have been used and worked from remote antiquity; but in modern times the cutting of them has been carried on chiefly in Bohemia, in the region around Mavoritz and Dlaskowitch. The stones occur in a trap rock, and are weathered out by its decomposition and gathered from gravels and beds of streams. They are of the rich red variety known as pyrope (g.r.), or Bohemian garnet; 10 to 36 carats in value and weight. The stone is called "Cape rubies," of South Africa, found in considerable quantity in German East Africa, and the beautiful garnets known as the "Arizona rubies." Garnets are so abundant in Bohemia as to constitute an important industry. In the year five hundred million to an equal number of cutters and as many as three thousand dealers. Extensive garnet cutting is also done in India, especially at Jeywore, there are large works employing natives who have been taught by Europeans. The Indian garnets, however, are very different in another respect, the almandine (g.r.), is equal in colour, though of emerald, which were drilled and suspended as drops. Those the French call "primes d'emeraudes." These were often...
LAPIDARY, AND GEM CUTTING

197

inclining more to a violet cast than the pyrope, and can be obtained in larger pieces. The ancient garnets, from Etruscan and Byzantine remains, some of which are flat plates set in gold, or carved with mythological designs, were probably obtained from India or perhaps from the region of the Caspian Sea, to the north of the Persian Gulf, in East Africa. Many are cut with the portraits of Sasanian kings with their characteristic pearl earrings. The East Indians carve small dishes out of a single garnet.

These stones are objects from transparent quartz, or rock crystal, has been carved on since the 16th century, first in Italy, by the greatest masters of the time, and afterwards in Prague, under Rudolph II., until the Thirty Years' War, when the industry was transferred to Bruges, where it was continued by the Styrian masters, and afterwards in Venice. Many of these are reproduced now in Vienna, and these were included in some American museums. Among them are rock-crystal dishes several inches across, beautifully engraved in intaglio and mounted in silver with gems. Other varieties of quartz, such as agate, jasper, &c., and amethysts, the stones of similar hardness, are likewise wrought into all manner of art objects. Caskets, vases, ewers, copes and animal and other fanciful forms, are familiar in these opaque and semi-transparent stones as in the diamond, and of the same size and weight, to their own cost. The most magnificent examples of these objects are seen in the United States and England. The most beautiful and most artistic manner. Cellini, and other masters in the 16th and 17th centuries, vied with each other in such work.

The most abundant of the agate stones is formed by the agent (q.v.), however, has been seen in Germany, at Waldkirch in Breisgau, and especially at Idar and Oberstein on the Nahe, in Oldenburg. The industry began in the 17th century, at the neighbouring town of Freiburg, but was transferred here in the 18th century to that of Idar, and it is still carried on. The number of men and workers having increased nearly threefold since the middle of the 19th century. The Idar and Oberstein industry was founded somewhat later, but is much more extensive. There are also the same objects as the others, but the work is a little less refined. There are many such objects, in fact, in the large, the middle, and the small stones, and from the same, the works of the lapidaries are of great beauty, and are made of hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.

Enormous masses of material are brought to these works; the stones of primitive and other ornamental stones, are cut from the same, and polished from hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.

The finest lapidary work modern France is done at Moulin la Vacherie St Simon, Seine-et-Marne, where several seventy-five, and fifty, and eighty-four, with the large and other ornamental stones, and from the same, the works of the lapidaries are of great beauty, and are made of hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.

The finest lapidary work modern France is done at Moulin la Vacherie St Simon, Seine-et-Marne, where several seventy-five, and fifty, are seen. From these, the works are of great beauty, and are made of hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.

There are two other great Russian imperial establishments of the same kind. One of these, founded by Catherine II., is at Peterhof, a short distance from the capital; it is a large building fitted up for the imperial lapidaries, and contains models for the work done at Ekaterinburg; these are returned and strictly preserved. In the Peterhof works, are to be seen the largest and most remarkable achievements of the lapidary art, vases and pedestals and sculptured surfaces, cut from the same, and polished from hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.

The third great establishment is at Kolyvan, in Siberia, bearing a like relation to the minerals and gem-stones of the Altai region, with the lapidaries, and containing many beautiful examples, and from the same, the works of the lapidaries are of great beauty, and are made of hard stones, whereas the Florentine mosaic work includes many substances that are much softer, as glass, shell, &c.
LAPIDARY, AND GEM CUTTING

within a recent period. Articles are made there, not only for all the civilized world, but for exportation to half-civilized and even barbarous nations, in great variety of shapes, styles and colours.

DIAMOND CUTTING.—On account of its extreme hardness, the treatment of the diamond in preparation for use in jewelry constitutes a separate and special branch of the lapidary's art. Any valuable gem must first be trimmed, cleaved or sawed into suitable shape and size, then cut into the desired form, and finally polished upon the faces which have been cut. The stages in diamond working are, therefore, (1) cleavage or division; (2) cutting; (3) polishing; but in point of fact there are four processes, as the setting of the stone for cutting is a somewhat distinct branch, and the workers are classed in four groups—cleavers, cutters, and polishers.

1. Cutting or Dividing.—Diamonds are always found as crystals, usually octahedral in form, though often irregular or distorted. The problem involved in each case is twofold: (1) to obtain the largest perfect stone possible, and (2) to remove any portions containing flaws or defects. These ends are generally met by cleaving the crystal, i.e., causing it to split along certain natural planes of structural weakness, which are parallel with the faces of the octahedron. This process requires the utmost judgment, care and skill on the part of the operator, as any error would cause great loss of valuable material; hence expert cleavers command very high wages. The stone is first examined closely, to determine the directions of the cleavage planes, which are recognizable only by an expert. The cleaver then cuts a narrow notch at the place selected, with another diamond having a sharp point; a rather dull iron or steel edge is then laid on this line, and a sharp blow struck upon it. If all has been skilfully done, the diamond divides at once in the direction desired. De Boet in 1609 mentions knowing some one who could part a diamond like mica or talc. In this process, each of the diamonds is fixed in cement on the end of a stick or handle, so that they can be held firmly while one is applied to the other.

When the stone is large and very valuable, the cleaving is a most critical process. Wollaston in 1790 made many favourable transactions by buying very poor-looking flawed stones and cleaving off the good parts. In the case of the immense Excelsior diamond of 971 carats, which was divided at Amsterdam in 1904, and made into ten splendid stones, the most elaborate study extending over two months was given to the work beforehand, and many models were made of the very irregular stone and divided in different ways to determine those most advantageous. This process was in 1908 applied to the most remarkable piece of work of the kind ever undertaken—the cutting of the gigantic Cullinan diamond of 3025½ English carats. The stone was taken to Amsterdam to be treated by the old-fashioned hand method, with innumerable precautions of every kind at every step, and the cutting was successfully accomplished after nine months' work (see The Times, Nov. 10, 1908). The two principal stones obtained (see DIAMOND), one a pendeloque or drop brilliant, and the other a square brilliant, were given 72 and 64 facets respectively (exclusive of the table and culet) instead of the normal 56.

This process of cleavage is the old-established one, still used to a large extent, especially at Amsterdam. But a different method has recently been introduced, that of sawing,1 which is now generally employed in Antwerp. The stone is placed in a small metal receptacle which is filled with melted aluminium; thus embedded securely, with only the part to be cut exposed, it is pressed firmly against the edge of a metallic disc or thin wheel, 4 or 5 in. in diameter, made of copper, iron or phosphor bronze, which is charged with diamond dust and oil, and made to revolve with great velocity. This machine was announced as an American invention, but the form now principally employed at Antwerp was invented by a Belgian diamond cutter in the United States, and is similar to slitting wheels used by gem cutters for centuries. Two patents were taken out, however, by different parties, with some distinctions of method. The process is much slower than hand-cleavage, but greatly diminishes the loss of material involved. It is claimed that not only can flaws or defective portions be thus easily taken off, but that any well-formed crystal of the usual octahedral shape (known in the trade as "six-point") can be divided in half very perfectly at the "girdle," making two stones, in each of which the sawed face can be used with advantage to form the "table" of a brilliant.

By another method the stone is sawed at a tangent with the octahedron, and then each half into three pieces; for this Wood method a total saving of 5% is claimed. Occasionally the finest material is only a small spot in a large mass of impure material, and this is taken out by most skilful cleaving.

After the cleaving or sawing, however, the diamond is rarely yet in a form for cutting the facets, and requires considerable shaping. This rough "blocking-out" of the final form is to assume, by removing irregularities and making it symmetrical, is called "brutage." Well-shaped and flawless crystals, indeed may not require to be cleaved, and then the brutage is the first process. Here again, the old hand methods are beginning to give place to mechanism. In either case two diamonds are taken, each fixed in cement on the end of a handle or support, and are rubbed one against the other until the irregularities are ground away and the general shape desired is attained. The old method was to do this by hand—an extremely tedious and laborious process. The machine method, invented about 1885 and first used by Field and Morse of Boston, is now used at Antwerp exclusively. In this, one diamond is fixed at the centre of a rotating apparatus, and the other, on an arm or handle, is placed so as to press steadily against the other stone at the proper angle. The rotating diamond thus becomes rounded and smoothed; the other one is then put in its place at the centre and their mutual action reversed.

At Amsterdam a hand-process is employed, which lies between the cleavage and the brutage. This consists in cutting or trimming away angles and irregularities all over the stone by means of a sharp-edged or pointed diamond, both being mounted in cement in pear-shaped handles for firm holding. This work is largely done by women. In all these processes the dust and fragments are caught and carefully saved.

2. Cutting and Setting.—The next process is that of cutting the facets; but an intervening step is the fixing or setting of the stone for that purpose. This is done by embedding it in a fusible alloy, melting at 440° Fahr., in a little cup-shaped depression on the end of a handle, the whole being called a dop. After the dop is set hard, the ground off is left exposed; and two such mounted diamonds are then rubbed against each other until a face is produced. This is the work of the cutter; it is very laborious, and requires great care and skill. The hands must be protected with leather gloves. The powder produced is carefully saved, as in the former processes, for use in the final polishing. When one face has been produced, the alloy is softened by heating, and the stone re-set for grinding another surface; and as this process is necessary for every face cut, it must be repeated many times for each stone. An improved dop has lately been devised in which the diamond is held by a system of claws so that all this heating and resetting can, it is claimed, be obviated, and the cutting completed with only two changes.

3. Polishing.—The faces having thus been cut, the last stage is the polishing. This is done upon horizontal iron wheels called "skiffs," made to rotate at very great velocities per minute. The diamond-powder saved in the former operations, and also made by crushing very inferior diamonds, here comes into use as the only material for polishing. It is applied with oil, and the stones are fixed in a "dop" in much the same way as in the cutting process. Again, the utmost skill and watchfulness are necessary, as the angles of the faces must be mathematically exact, in order to yield the best effects by refraction and reflection of light, and their sizes must be accurately regulated to preserve the symmetry of the stone. In this process, also,
the old hand method is already replaced in part by an improved device whereby the diamond is held by adjustable clamps, on a base that can be rotated, so as to apply it in any desired position. By this means the time and trouble in repeated re-setting is eliminated, as well as the liability to injury from the heating and cooling; the services of special "setters" are also made needless.

The rapid development of mechanical devices for the several stages of diamond cutting has greatly influenced the art.

A very interesting comparison was brought out in the thirteenth report of the American Commissioner of Labour, as to the advantages and relations of hand-work and machinery in this branch of industry. It appeared from the data gathered that the advantage lay with machinery as to time and with hand-work as to cost, in the ratios respectively of 1 to 3-38 and 1:76 to 1. In other words, about half the gain in time is lost by increased expense in the use of machine methods. A great many devices and applications have been developed within the last few years, owing to the immense increase in the production of diamonds from the South African mines, and their consequent widespread use.

**History of Diamond Cutting.**—The East Indian diamonds, many of which were brought to England in the early part of the eighteenth century, came into the fashion by merely rounding off the angles. Among church jewels in Europe are a few diamonds of unknown age and source, cut four-sided, with a table above and a pyramid below. Several cut diamonds are recorded among the treasures of Louis Anjou in the third quarter of the fifteenth century. Decagonal diamonds and cut diamonds with five facets of diamond polishing are early in the century following, when one Hermann became noted for such work in Paris. The modern method of "brilliant" cutting, however, is generally ascribed to Louis de Bèringen, who, in 1475, cut an enormous diamond weighing 772 carats, and which had been brought to him by Charles the Bold, duke of Burgundy. He taught this process to many pupils, who afterwards settled in Antwerp and Amsterdam, which have been the chief centres of diamond cutting ever since.

It was during the eighteenth century that the art of diamond cutting was at its height, and the number of well-proportioned brilliant of 58 facets. Some very fine work was done early in London also, but most of the workmen were Jews, who, being objectionable in England, finally betook themselves to Amsterdam and Antwerp. Efforts have been made to establish the art in London, as, where, as the great diamond mart of the world, it should peculiarly belong.

The same wise policy was even more marked in Portugal. That nation had its colonial possessions in India, following the voyages and discoveries of Da Gama, and thus became the chief importer of diamonds into Europe. Early in the eighteenth century, also, the diamond mines were discovered in Brazil, which was then likewise a Portuguese possession; but the whole diamond product of the world came to Portugal, and thence to Holland, which had already become the chief centre of cutting and polishing diamonds. But in time the Jews were forced away, and went to Holland and Belgium, where diamond cutting has been concentrated since the middle of the 18th century.

The United States have endeavoured to develop native talent in the field of diamond cutting in the United States. The pioneer in this movement was Henry D. Morse of Boston, associated with James W. Yerrington of New York. He opened a diamond-cutting establishment about 1860 and carried it on for some years. He then retired and devoted himself to the distribution and retailing of diamonds. He left in New York, employing about 500 men. Since then the industry has gradually developed. Many of the European diamond workers who came over to America remained and carried on their art; and the movement then begun has become permanent. New York is now recognized as one of the chief diamond-cutting centres in the world; there are some 500 cutters, and the quality of work done is fully equal, if not superior, to any in the Old World. So well is this fact established that American-cut diamonds are exported and sold in Europe to a considerable and an increasing extent.

The history of diamond cutting in America has been one of an industry of cutting has grown up since 1875. Small mills are run by water power, and the machinery, as well as the methods, are from Holland. This American diamond work is done both well and cheaply, and supplies the local market.

The leading position in diamond working still belongs to Amsterdam, where the number of persons engaged in the industry has trebled since about 1875, in consequence of the enormous increase in the world's supply of diamonds. The number now amounts to about 5,000 men in one-third of a hundred cutters, polishers, &c. The number of cutting establishments in Amsterdam is about seventy, containing some 7000 mills.

Antwerp comes next with about half as many and a total of several thousand persons engaged in all departments, including about seventy women. These are distributed among thirty-five or forty establishments. A majority of the workers are Belgians, but there are many Dutch, Poles and Austro-Hungarians, principally Jews. The same conditions of dishonesty, and the use of various tricks to diminish the value of stones, thus causing the price to increase of the stones on which the tricks are used. The art of diamond cutting is the one of all the arts which is the least observed and the least appreciated. The glass and crystal workers, who in the making of jewels are supplied with many diamonds of inferior quality, and but little attention, actual or possible; yet losses from this cause are almost unknown. The wages paid are good, averaging from £2, 9s. 6d. to £2, 17s. 6d. a week. Sorters receive from 9s. to £2; cutters from £2, 9s. 6d. to £3, 6s., and cleaners from £3, 14s. upward.

With the recent introduction of electricity in diamond cutting there has been a revolution in that industry. Whereas former wheels were made to revolve by steam, they are now placed in direct connection with electric motors, although there is not a motor to each individual machine. The saws for slitting the diamond can thus be made to revolve much more rapidly, and there is a cleanliness and a speed about the work never before attained.

(continued)
it presents the form of the rhombic dodecahedron. Its specific gravity is 2.38 to 2.45, and its hardness about 5–5.5, so that being comparatively soft it tends, when polished, to lose its lustre rather readily. The colour is generally a fine azure or rich Berlin blue, but some varieties exhibit green, violet and even red tints, or may be altogether colourless. The colour is sometimes improved by heating the stone. Under artificial illumination the dark-blue stones may appear almost black. The mineral is opaque, with only slight translucency at thin edges.

Analyses of lapis lazuli show considerable variation in composition, and this led long ago to doubt as to its homogeneity. This doubt was confirmed by the microscopic studies of L. H. Fischer, F. Zirkel and H. P. J. Vogelsang, who found that sections showed bluish particles in a white matrix; but it was reserved for Professor W. C. Brögger and H. Bäckström, of Christiania, to separate the several constituents and subject them to analysis, thus demonstrating the true constitution of lapis lazuli, and proving that it is a rock rather than a definite mineral species. The essential part of most lapis lazuli is a blue mineral allied to sodalite and crystallized in the cubic system, which Brögger distinguishes as lazurite, but this is intimately associated with a closely related mineral which has long been known as haüyne, or haünyite. The lazurite, sometimes regarded as true lapis lazuli, is a sulphur-bearing sodium and aluminium silicate, having the formula: $Na_2(SiO_3)_2Al$. As the lazurite and the haünyite seem to occur in molecular intermixture, various kinds of lapis lazuli are formed; and it has been proposed to distinguish some of them as lazurite-lapis and haünyte-lapis, according as one or the other mineral prevails. The lazurite of lapis lazuli is to be carefully distinguished from lazurite, an aluminium-magnesium phosphate, related to turquoise. In addition to the blue cubic minerals in lapis lazuli, the following minerals have also been found: a non-ferriferous dispoise, an amphibole called, from the Russian mineralogist, koksharovite, orthoclase, plagioclase, a muscovite-like mica, apatite, titanite, zircon, calcite and pyrite. The calcite seems to form in some cases a great part of the lapis; and the pyrite, which may occur in patches, is often altered to limonite.

Lapis lazuli usually occurs in crystalline limestone, and seems to be a product of contact metamorphism. It is recorded from Persia, Tartary, Tibet and China, but many of the localities are vague and some doubtful. The best known and probably the most important locality is in Badakshan. There it occurs in limestone, in the valley of the river Kokcha, a tributary to the Oxus, south of Figaran. The mines were visited by Marco Polo in 1271, by J. B. Fraser in 1825, and by Captain John Wood in 1813, 1815, and 1818, who burnt some of the mines; but the occurrence of the lapis lazuli is recognized by the mines: mils of indigo-blue colour, amani sky-blue, and salat of green tint. Another locality for lapis lazuli is in Siberia near the western extremity of Lake Baikal, where it occurs in limestone at its contact with granite. Fine masses of lapis lazuli occur in the Andes, in the vicinity of Ovalle, Chile. In Europe lapis lazuli is found as a rarity in the peperino of Latium, near Rome, and in the ejected blocks of Monte Somma, Vesuvius.

LAPITHEAE, a mythical race, whose home was in Thessaly in the valley of the Peneus. The genealogies make them a kindred race with the Centaurs, their king Peirithoüs being the son, and the Centaurs the grandchildren (or sons) of Ixion. The best-known legends with which they are connected are those of Ixion (q.v.) and the battle with the Centaurs (q.v.). A well-known story is that of Caenis, said to have been originally a girl named Caenis, the favourite of Poseidon, who changed her into a man and made her invulnerable (Ovid, Metam. xii. 146 ff.). In the Centaur battle, having been crushed by rocks and trunks of trees, he was changed into a bird; or he disappeared into the depths of the earth unharmed. According to some, the Lapithae are representatives of the giants of fable, or spirits of the storm; according to others, they are a semi-legendary, semi-historical race, like the Myrmidons and other Thessalian tribes. The Greek sculptors of the school of Phidias conceived of the battle of the Lapithae and Centaurs as a struggle of mankind and mischievous monsters, and symbolical of the great conflict between the Greeks and Persians. Sidney Colvin (Journ. Hellen. Stud. i. 64) explains it as a contest of the physical powers of nature, and the mythical expression of the terrible effects of swollen waters.

LA PLACE (Lat. Plaacens), JOSÉ DE (1606–1665), French Protestant divine, was born in Brittany. He studied and afterwards taught philosophy at Saumur. In 1625 he became pastor of the Reformed Church at Nantes, and in 1632 was appointed professor of theology at Saumur, where he had as his colleagues, appointed at the same time, Moses Amyraut and Louis Cappell. In 1640 he published a work, Theses theologicae de statu hominis lapis ante gratiam, which was looked upon with some suspicion as containing liberal ideas about the doctrine of original sin. The view that the original sin of Adam was not imputed to his descendants was condemned at the synod of Charenton (1645), but on the defense being made to La Place, his position perhaps was not quite clear. As a matter of fact La Place distinguished between a direct and indirect imputation, and after his death his views, as well as those of Amyraut, were rejected in the Formula consensus of 1675. He died on the 17th of August 1665.

La Place’s defence was published with the title Disputations academicae (3 vols., 1649–1651; and again in 1663); his work De la formation primi peheris Adam in 1654. A collected edition of his works appeared at Francaer in 1669, and at Aubencet in 1702.

LAPLACE, PIERRE SIMON, MARQUIS DE (1749–1827), French mathematician and astronomer, was born at Beaumont-en-Auge in Normandy, on the 28th of March 1749. His father was a small farmer, and he owed his education to the interest excited by his lively parts in some persons of position. His first distinctions are said to have been gained in theological controversy, but at an early age he became mathematical teacher in the military school of Beaumont, the classes of which he had attended as an extern. He was not more than eighteen when, armed with letters of recommendation, he approached J. B. de Lalande, then at the height of his fame, in the hope of finding a career in Paris. The letters remained unnoticed, but Laplace was not crushed by the rebuff. He wrote to the great geometr a letter on the principles of mechanics, which evoked an immediate and enthusiastic response. “You,” said d’Alembert to him, “needed no introduction; you have recommended yourself; my support is your due.” He accordingly obtained for him an appointment as professor of mathematics in the École Militaire of Paris, and continued zealously to forward his interests.

Laplace had not yet completed his twenty-fourth year when he entered upon the course of discovery which earned him the title of “the Newton of France.” In his first published paper 1 shown his mastery of analysis, he proceeded to apply its resources to the great outstanding problems in celestial mechanics. Without the reference being made to it, the proposition that the universe was fitly ordered was offered, whose possibility was, indeed, simply not quite clear. As a matter of fact La Place distinguished between a direct and indirect imputation, and after his death his views, as well as those of Amyraut, continued zealously to forward his interests.

1 'Recherches sur le calcul intégral,’ Mélanges de la Soc. Roy. de Turin (1766–1769).
in 1787, of an entire group of remarkable discoveries. It would be difficult, in the whole range of scientific literature, to point to a memoir of equal brilliancy with that published (divided into three parts) in the volumes of the Academy for 1784, 1785 and 1786. The long-sought cause of the "great inequality" of Jupiter and Saturn was found in the near approach to commensurability of their mean motions; it was demonstrated in two elegant theorems, independently of any except the most general considerations as to mass, that the mutual action of the planets could never largely affect the eccentricities and inclinations of their orbits; and the singular peculiarities detected by him in the Jovian system were expressed in the so-called "laws of Laplace." He completed the theory of these bodies in a treatise published among the Paris Mémoirs for 1788 and 1789; and the striking superiority of the tables computed by J. B. J. Delambre from the data there supplied marked the profit derived from the investigation by practical astronomy. The year 1787 was rendered further memorable by Laplace's announcement on the 19th of November (Mémoirs, 1788), of the dependence of lunar acceleration upon the secular variations in the eccentricity of the earth's orbit. The last apparent anomaly, and the last threat of instability, thus disappeared from the solar system.

With these brilliant performances the first period of Laplace's scientific career may be said to have closed. If he ceased to make striking discoveries in celestial mechanics, it was rather his subject-matter than his powers that failed. The general working of the great machine was now laid bare, and it needed a further advance of knowledge to bring a fresh set of problems within reach of investigation. The time had come when the results obtained in the development and application of the law of gravitation by three generations of illustrious mathematicians might be presented from a single point of view. To this task the second period of Laplace's activity was devoted. As a monument of mathematical genius applied to the celestial revolutions, the Mécanique céleste ranks second only to the Principia of Newton.

The declared aim of the author 1 was to offer a complete solution of the great mechanical problem presented by the solar system, and to bring theory to coincide so closely with observation that empirical equations should no longer find a place in astronomical tables. His success in both respects fell little short of his intention. The first part of the work (2 vols. 4to, Paris, 1799) contains methods for calculating the movements of translation and rotation of the heavenly bodies, for determining their figures, and resolving tidal problems; the second half was dedicated to the improvement of tables, exhibits in the third and fourth volumes (1802 and 1805) the application of these formulae; while a fifth volume, published in three installments, 1825-1827, comprises the results of Laplace's labours. It was with reason that his name was inscribed on each separate branch of his subject. In the delicate task of apportioning his own large share of merit, he certainly does not err on the side of modesty; but it would perhaps be as difficult to produce an instance of injustice, as of generosity in his estimate of others. Far more serious blame attaches to his all but total suppression in the body of the work—and the fault pervades the whole of his writings—of the names of his predecessors and contemporaries. The silence is more marked at those analytical methods, by no means easy to provide in 1816 in the Academy, of which institution he became president in the following year. The famous "nebular hypothesis" of Laplace made its appearance in the Système du monde. Although relegated to a note (vii), and propounded "With a défaite que doit inspirer tout ce qui n'est point un résultat de l'observation ou du calcul," it is plain, from the complacency with which he recurred to it 2 at a later date, that he regarded the speculation with considerable interest. That it formed the starting-point, and largely prescribed the course of thought on the subject of planetary origin is due to the simplicity of its assumptions, and the clearness of the mechanical principles involved, rather than to any cogent evidence of its truth. It is curious that Laplace, while bestowing more attention than they deserved on the crude conjectures of Buffon, seems to have been unaware that he had been, to some extent, anticipated by Kant, who had put forward in 1755, in his Allgemeine Naturgeschichte, a true though defective nebular cosmogony.

The career of Laplace was one of scarcely interrupted prosperity. Admitted to the Academy of Sciences as an associate in 1773, he became a member in 1785; having, about a year previously, succeeded E. Bezout as examiner to the royal artillery. During an access of revolutionary suspicion, he was removed from the commission of weights and measures; but the slight was quickly effaced by new honours. He was one of the first members, and became president of the Bureau of Longitudes, took a prominent place at the Institute (founded in 1795), professed analysis at the Ecole Normale, and aided in the organization of the decimal system. The publication of the Mécanique céleste gained him world-wide celebrity, and his name appeared on the lists of the principal scientific associations of Europe, including the Royal Society. But scientific distinctions by no means satisfied his ambition. He aspired to the rôle of a politician, and has left a memorable example of genius degraded to servility for the sake of a ribbon and a title. The arduous of his republican principles gave place, after the 18th Brumaire, to devotion towards the first consul, a sentiment promptly rewarded with the post of minister of the interior. His incapacity for affairs was, however, so flagrant that it became necessary to supersede him at the end of six weeks, when Lucien Bonaparte became his successor. "He brought into the administration," said Napoleon, "the spirit of the infinitesimal." His failure was consigned by elevation to the senate, of which body he became chancellor in September 1803. He was at the same time named grand officer of the Legion of Honour, and obtained in 1813 the same rank in the new order of Reunion. The title of count he had acquired on the creation of the empire. Nevertheless he cheerfully gave his voice in 1814 for the dethronement of his patron, and his "suppleness" merited a seat in the chamber of peers, and, in 1817, the dignity of a marquise. The memory of these transgressions is perpetuated in its writings. The first edition of the Système du monde was inscribed to the Council of Five Hundred; to the third volume of the Mécanique céleste (1825) the author appended the declaration that, of all the truths contained in the work, that most precious to the author was the expression of his gratitude and devotion towards the "pacificator of Europe"; upon which noteworthy protestation the suppression in the editions of the Théorie des probabilités subsequent to the restoration, of the original dedication to the emperor formed a fitting commentary.

During the later years of his life, Laplace lived much at Arcueil, where he had a country-place adjoining that of his friend C. L. Berthollet. With his co-operation the Société d'Arcueil was formed, and he occasionally contributed to its Mémoirs. In this peaceful retirement he pursued his studies with unabated ardour, and received with uniform courtesy distinguished visitors from all parts of the world. Here, too, he died, attended by his physician, Dr. Maigrand, and his mathematical coadjutor, Alexis Bouvard, on the 5th of March 1827. His last words were: "Ce que nous connaissions est peu de chose, ce que nous ignorons est immense."

Expressions occur in Laplace's private letters inconsistent.

2 Journal des savans (1805).
with the theistical opinions he is commonly believed to have held. His character, notwithstanding the egotism by which it was disfigured, had an amiable and engaging side. Young

men of science found in him an active benefactor. His relations with these "adopted children of his thought" possessed a singular charm of affectionate simplicity; their intellectual progress and material interests were objects of equal solicitude to him, and he demanded in return only diligence in the pursuit of knowledge. Biot relates that, when he himself was beginning his career, Laplace introduced him at the Institute for

the purpose of explaining his supposed discovery of equations of mixed differences, and afterwards showed him, under a strict pledge of secrecy, the papers, then yellow with age, in which he had long before obtained the same results. This instance of abnegation is the more worthy of record that it formed a marked exception to Laplace's usual course. Between him and A. M.

Legendre there was the feeling noted by coldness," owing to his appropriation, with scant acknowledgment, of the fruits of the others' labours; and Dr Thomas Young counted himself, rightly or wrongly, amongst the number of those similarly aggrieved by him. With Lagrange, on the other hand, he always remained on the best of terms. Laplace left a son, Charles

Emile Pierre Joseph Laplace (1789-1874), who succeeded to his title, and rose to the rank of general in the artillery.

It might be said that Laplace was a great mathematician by the original structure of his mind, and became a great discoverer through the sentiment which animated it. The regulated

enthusiasm with which he regarded the system of nature was with him from first to last. It can be traced in his earliest essay, and it dictated the raving of his final illness. By it his extraordinary analytical powers became strictly subordinated to physical investigations. To this lofty quality of intellect he added a rare faculty of perceiving analogies, and in detecting the new truths that lay concealed in the nucleus of the old, a faculty of mental grip, by which problems, once seized, were held fast, year after year, until they yielded their solutions. In every branch of physical astronomy, accordingly, deep traces of his work are visible. "He would have completed the science of the skies," Baron Fourier remarked, had the science been capable of completion."

It may be added that he first examined the conditions of stability of the system formed by Saturn's rings, pointed out the necessity for their being subjected to a periodic effect, discovered the orbit of the cannonball with that established by the planet Jupiter; he detected the existence in the solar system of an invariant plane such that the sum of the products of the planetary masses by the projections of the mass of the planet on the plane of the ecliptic was a constant. Laplace also added to the list of men who

were prominent in the field of astronomy. M. le comte (1784), besides constructing a satisfactory formulae for the barometrical determination of height, added a chapter on the theory of elliptic defects, and furnished one of the most remarkable proofs of his analytical genius.

C. Maclaurin, Legendre and A. M. Legendre, had furnished partial solutions of the problem, confining their attention to the possible figures which would satisfy the conditions of equilibrium. Laplace treated the subject from the point of view of the gradual aggregation and cooling of a mass of matter, and demonstrated that the form which such a mass would ultimately assume would be that of a spheroid whose equator was determined by the primitive plane of maximum areas.

The related subject of the attraction of spheroids was also signally

promoted by him. Legendre, in 1753, extended Maclaurin's theorems to the case of spheroids with an axis of symmetry. The theory of the spheroid of revolution where the attracted point, instead of being limited to the axis or equator, occupied any position in space; and Laplace, in his treatise "Théorie du mouvement et de la figure elliptique des planètes" (1784), endeavoured to generalize this by proving, what had been suspected by Legendre, that the theorem was equally true for any confocal ellipsoids. Finally, in a celebrated memoir, "Théorie des attractions des sphéroïdes et de la figure des planètes," published in 1796 among his "Oeuvres de Laplace," for the year 1782, although written after the treatise of 1784, Laplace treated exhaustively the general problem of the attraction of any spheroid upon a particle situated outside or upon its surface.

The device known as the method of least squares, for reducing numerous equations of condition to the number of unknown quantities to be determined, had been adopted as a practically convenient rule by Gauss and Legendre; but Laplace first applied it to the problem in probabilities, and proved by an intricate and difficult course of reasoning that it was also the most advantageous, the mean of the probable values of any function as the coefficients in the expansion of another function with reference to a different variable. The latter is therefore the generating function of the former. A direct and an inverse calculus is thus created, this object of the theory of generating functions, of the latter to discover the generating function from the coefficients. The former is a problem of interpolation, the other a step towards the solution of an equation which has infinite coefficients. The method, however, is now obsolete owing to the more extended facilities afforded by the calculus of operations.

The first formal proof of Lagrange's theorem for the development in series of certain integrals was given in 1786 by Laplace, who gave to it an extended generality. He also showed that every equation of an even degree must have at least one real quadratic factor, reduced the solution of linear differential equations to the solution of linear algebraic equations, and proved the theorem that the linear partial differential equation of the second order might be solved. He was also the first to consider the difficult problems involved in equations of mixed differences, and to prove that what had been supposed to be true in finite differences, the second order might always be converted into a continued fraction.

In 1842, the works of Laplace being nearly out of print, his widow was about to sell a farm to procure funds for a new impression, when she received a letter from the government of Laplace's great debt of 40,000 francs having been obtained from the chamber, a national edition was issued in seven toms., bearing the title "Oeuvres de Laplace (1843-1847)."

The Mécanique céleste, with its four supplements, the Système du monde, and the 7th the Th. des probabilités, to which the more popular Essai philosophiqueforms an introduction. Of the four supplements added by the author (1816-1825) he tells us that the problems in the
The last were contributed by his son. An enumeration of Laplace's memoirs and papers (about one hundred in number) is rendered superfluous by their embodiment in his principal works. The Théorie des prob., was first published in 1812, the Essai in 1814; and both works were translated into German within the same year. An English version of the Essai appeared in New York in 1802. Laplace's first separate work, Théorie du mouvement et de la figure elliptique des planètes (1784), was published at the expense of President de la Concorde, and with a prize of 500 livres. The first two editions and the French original (1821), formed the fifth book of the 5th edition of the Système du monde. An English translation, with copious elucidatory notes, of the first 4 vols. of the Mécanique céleste, by N. Bowditch, was published at Boston, U.S. (1829-1830), in 4 vols. 4to; a complete set of certain portions of the same work by Mrs Somerville appeared in 1831, and a German version of the first 2 vols. by Burchhardt at Berlin in 1801. English translations of the Système du monde by J. Todhunter, the first two parts of which were published in London in 1836, and the second in 1830. An edition entitled Les Œuvres complètes de Laplace (1787) &c., which is to include all his memoirs as well as his separate works, is in course of publication under the auspices of the Academy of Sciences. The thirteenth 4to volume was issued in 1904. Some of Laplace's results in the theory of probabilities are simplified in S. F. Lacroix's Traité élémentaire du calcul des probabilités and De Morgan's Essai, published in Lardner's Cabinet Cyclopaedia. For the history of the subject see A History of the Mathematical Theory of Probability, by Isaac Todhunter (1865). Laplace's treatise on specific heat was published in German in 1892 as No. 40 of W. Ostwald's Klassiker der exakten Wissenschaften. An English translation of Lacroix's Essai pour l'établissement de l'institut, xlixxi. (1831); Revue encyclopédique, xliii. (1829); S. D. Poisson's Funeral Oration (Comm. des Temps, 1830, p. 19); F. X. von Ziehe, Allg. geographische Ephemerae, iv. 70 (1799); F. Arago, Annales du Bureau des Long, 1812, p. 271. translated among Arago's Bibliothèque de la Faculté de Sciences de l'Université. J. C. Poggendorf, Biog.-Lit. Handwörterbuch. (A. M. C.)

LAPLAND, or LAPPLAND, a name used to indicate the region of northern Europe inhabited by the Lapps, though not applied to any administrative district. It covers in Norway the division (amter) of Finnmarken and the higher inland parts of Tromsö and Nordland; in Russia territory the western part of the government of Archangel as far as the White Sea and the northern part of the Finnish district of Uleborg; and in Sweden the inland and northern parts of the old province of Norrland, roughly coincident with the districts (län) of Norbotten and Vesterbotten, and divided into five divisions.—Torne Lappmark, Ule Lappmark, Pite Lappmark, Lycksele Lappmark and Åsele Lappmark. The Norwegian portion is thus insignificant; of the Russian only a little lies south of the Arctic circle, and the whole is less accessible and more sparsely populated than the Swedish, the southern boundary of which may be taken arbitrarily at 62° N. though scattered families of Lapps occur much farther south, even in the Hardanger Fjord in Norway. The Scandinavian portion of Lapland presents the usual characteristics of the mountain plateau of that peninsula—on the west side the bold headlands and fjords, deeply-grooved valleys and glaciers of Norway, on the cast the long mountain lakes and great lake-fed rivers of Sweden. Russian Lapland is broadly similar to the lower-lying parts of Swedish Lapland, but the great lakes are more generally distributed, and the valleys are less direct. The country is low and gently undulating, broken by detached hills and ridges not exceeding in elevation 2500 ft. In the uplands of Swedish Lapland, and to some extent in Russian Lapland, the lakes afford the principal means of communication; it is almost impossible to cross the forests from valley to valley without a native guide. In Sweden the few farms of the Swedes who inhabit the region are on the lake shores, and are chiefly used for travelling and fishing. In Russian Lapland, the typical boats of the district, pointed at bow and stern, unusually low amidships, and propelled by short sculls or paddles. Sailing is hardly ever practised, and squalls on the lakes are often dangerous to the rowing-boats. On a few of the lakes wood-fired steam-launches are used in connexion with the timber trade, which is considerable, as practically the whole region is forested. Between the lakes all journeying is made on foot. The heads of the Swedish valleys are connected with the Norwegian fjords by passes generally traversed only by tracks; though from the head of the Ume a driving road crosses to Mo on Ranen Fjord. Each principal valley has a considerable village at or near the tail of the lake-chain, up to which a road runs along the valley. The village consists of wooden cottages with an inn (gåstgivaregård), a church, and frequently a collection of huts without windows, closed in summer, but inhabited by the Lapps when they come down from the mountains to the winter fairs. Sometimes there is another church and small settlement in the upper valley, to which, once or twice in a summer, the Lapps come from great distances to attend service. To these, too, they sometimes bring their dead for burial, bearing them if necessary on a journey of many days. Though Lapland gives little scope for husbandry, a bad summer being commonly followed by a winter famine, it is richly furnished with much that is serviceable to man. There are copper-mines at the mountain of Sulfeltma; and the iron deposits in Norrland are among the most extensive in the world. Their working is facilitated by the railway from Stockholm to Gällivara, Kirunavara and Narvik on the Norwegian coast, which also connects them with the port of Luleå on the Gulf of Bothnia. The supply of timber (pine, fir, spruce and birch) is unlimited. Though fruit-trees will not bear there is an abundance of edible berries; the rivers and lakes abound with trout, perch, pike and other fish, and in the lower waters with salmon; and the cod, herring, halibut and Greenland shark in the northern seas attract numerous Norwegian and Russian fishermen.

The climate is thoroughly Arctic. In the northern parts unbroken daylight in summer and darkness in winter last from two to three months each; and through the greater part of the country the sun does not rise at mid-winter or set at midsummer. In December and January in the far north there is little more daylight than a cold glimmer of dawn; by February, however, there are some hours of daylight; in March the heat of the sun is beginning to modify the cold, and now and in April the birds of passage begin to appear. In April the snow is melting from the branches; spring comes in May; spring flowers are in blossom, and grain is sown. At the end of this month or in June the ice is breaking up on the lakes, woods rush into leaf, and the unbroken daylight of the northern summer soon sets in. July is quite warm; the great rivers come down full from the melting snows in the mountains. August is a rainy month, the time of harvest; night-frosts may begin already about the middle of the month. All preparations for winter are made during September and October, and full winter has set in by November.

The Lapps.—The Lapps (Swed. Lappar; Russian Lopar; Norw. Finner) call their country Salme eller Same, and themselves Samedelers—who names almost identical with those employed by the Finns for their country and race, and probably connected with a root signifying "dark." Lapp is almost certainly a nickname imposed by foreigners, although some of the Lappa apply it contemptuously to those of their countrymen whom they think to be less civilized than themselves. In Sweden and Finland the Lapps are usually divided into fisher, mountain and forest Lapps. In Sweden the first class includes many impoverished mountain Lapps. As described by Laestadius (1827-1892), their condition was very miserable; but since his time matters have improved. The principal colony has its summer quarters on the Stora-Lule Lake, possesses good boats and nets, and, besides catching and drying fish, makes money by the shooting of wild fowl and the gathering of eggs. When he has acquired a little means it is not unusual for the fisher to settle down and reclaim a bit of land. The mountain and forest Lapps are the true representatives of the race. In the wandering life of the mountain Lapp his autumn residence, on the borders of the forest district, may be considered as the central point; it is there that he erects his njulla, a small wooden storehouse raised high above the ground by one or more piles. About the beginning of November he begins to wander south or east into the forest land, and in the winter he may visit, not only

1 The most probable etymology is the Finnish lappu, and in this case the meaning would be the "land's end folk."
such places as Jokkmokk and Arjeplog, but even Gefle, Upsala or Stockholm. About the beginning of May he is back at his njalla, but as soon as the weather grows warm he pushes up to the mountains, and there throughout the summer pastures his herds and prepares his store of cheese. By autumn or October he is busy at his njalla killing the surplus reindeer bulls and curing meat for the winter. From the mountain Lapp the forest (or, as he used to be called, the spruce-fir) Lapp is mainly distinguished by the narrower limits within which he pursues his nomadic life. He never wanders outside of a certain district, in which he possesses hereditary rights, and maintains a series of camping-grounds which he visits in regular rotation. In May or April he lets his reindeer loose, to wander as they please; but immediately after midsummer, when the mosquitoes become troublesome, he goes to collect them. Catching a single deer and belling it, he drives it through the wood; the other deer, whose instinct leads them to gather into herds for mutual protection against the mosquitoes, are attracted by the smell which they are wont to give out; and as the mosquitoes few, the Lapp finds it next to impossible to bring the creatures together. About the end of August they are again let loose, but they are once more collected in October, the forest Lapp during winter pursuing the same course of life as the mountain Lapp.

In Norway there are three classes— the sea Lapps, the river Lapps and the mountain Lapps, the first two settled, the third nomadic. The mountain Lapps have a rather ruder and harder life than the same class in Sweden. About Christmas those of Kautokeino and Karasjok are usually settled in the neighbourhood of the churches; in summer they visit the coast, and in autumn they return inland. Previous to 1852, when they were forbidden by imperial decree, they were wont in winter to move south across the Russian frontiers. It is seldom possible for them to remain more than three or four days in one spot. Flesh is their favourite, in winter and summer; the latter they find though they also use reindeer milk, cheese and rye or barley cakes. The sea Lapps are in some respects hardly to be distinguished from the other coast dwellers of Finnmark. Their food consists mainly of cooked fish. The river Lapps, many of whom, however, are descendants of Finns proper, breed cattle, attempt a little tillage and entrust their reindeer to the care of mountain Lapps.

In Finland there are comparatively few Laplanders, and the great bulk of them belong to the fisher class. Many are settled in the neighbourhood of the Enare Lake. In the spring they go down to the Norwegian coast and take part in the sea fisheries, returning to the lake about midsummer. Formerly they found the capture of wild reindeer a profitable occupation, using for this purpose a palisaded avenue gradually narrowing towards a pitfall.

The Russian Lapps are also for the most part fishers, as is natural in a district with such an extent of coast and such a number of lakes, not to mention the advantages which have over the reindeer keeper in connexion with the many fairs of the Greek Church. They maintain a half nomadic life, very few having become settlers in the Russian villages. It is usual to distinguish them according to the district of the coast which they frequent, as Murman (Murmanskii) and Terian (Terski) Lapps. A separate tribe, the Filmans, i.e. Finnmans, wander about the Pazyets, Motov and Pechenga tundras, and retain the peculiar dialect and the Lutheran creed which they owe to a former connexion with Sweden. They were formerly known as the "twice and thrice tributary" Lapps, because they paid to two or even three states—Russia, Denmark, and Sweden.

The Lapps within the historical period have considerably recruited themselves from neighbouring races. Shortness of stature is their most obvious characteristic, though in regard to this much exaggeration has prevailed. Dülken found an average of 4'9" ft. for males and a little less for females; Mante- gagna, who made a number of anthropological observations in Norway in 1879, gives 5 ft. and 4'75" ft., respectively (Archivio per l'antrop., 1886). Individuals much above or much below the average are rare. The body is usually of fair proportions, but the legs are rather short, and in many cases somewhat handy. Dark, swarthy, yellow, copper-coloured are all adjectives employed to describe their complexion—the truth being that their habits of life do not conduce either to the preservation or display of the natural colour of their skin, and that some of them are really fair, and others, perhaps the majority, really dark. The colour of the hair ranges from blonde and reddish to a bluish or greyish black; the eyes are black, hazel, blue or grey. The shape of the skull is the most striking peculiarity of the Lapp. He is the most brachycephalous type of man in Europe, perhaps in the world. According to Virchow, the women in width of face are more Mongoloid in type than the men, but neither in men nor women does the opening of the eye show any true obliquity. In children the eye is large, open and round. The nose is always low and broad, more markedly retroussé among the females than the males. Wrinkled as the nose is, the flesh of the nose is of a silkier and firmer kind than that of other races. There is a strong manifestation of agility, and the muscular system is well developed; but there is deficiency of fatty tissue, which affects the features (particularly by giving relative prominence to the eyes) and the general character of the skin. The thinness of the skin, indeed, can but rarely be paralleled among other Europeans. Among the Lapps, as among other lower races, the index is shorter than the ring finger. The Lapps are a quiet, inoffensive people. Crimes of violence are almost unknown, and the only common breach of law is the killing of tame reindeer belonging to other owners. In Russia, however, they have a bad reputation for lying and general untrustworthiness, and drunkenness is well-nigh a universal vice. In Scandinavia laws have been directed against the importation of intoxicating liquids into the Lapp-country since 1773. Superficially at least the great bulk of the Lapps have been Christianised—some of the Scandinavian countries being Protestant, those of Russia members of the Greek Church. Although the first attempt to convert the Lapps to Christianity seems to have been made in the 11th century, the worship of heathen idols was carried on openly in Swedish Lappland as late as 1687, and secretly in Norway down to the first quarter of the 18th century, while the practices of heathen rites survived into the 19th century, if indeed they are extinct even yet. Lapp graves, prepared in the heathen manner, have been discovered in upper Namdal (Norway), belonging to the years 1820 and 1826. In education the Scandinavian Lapps are far ahead of their Russian brethren, to whom reading and writing are as unfamiliar as they were to their pagan ancestors. The general manner of life is patriarchal. The father of the family has complete authority over all its affairs; and on his death this authority passes to the eldest son. Parents are free to disinherit their children; and, if a son separates from the family without his father's permission, he receives no share of the property except a gun and his wife’s dowry.

The Lapps are of necessity conservative in most of their habits, many of which can hardly have altered since the first taming of the reindeer. But the strong current of mercantile enterprise has carried a few important products of southern civilization into their luts. The lines in which James Thomson describes their simple life—

The reindeer form their riches: these their tents, their robes, their beds, and all their homely wealth.

Supply; their wholesome fare and cheerful cups—

are still applicable in the main to the mountain Lapps; but even they have learned to use coffee as an ordinary beverage and to wear stout Norwegian cloth (rudmal).

Linguistically the Lapps belong to the Finno-Ugrian group (q.v.); the similarity of their speech to Finnish is evident though not pronounced. They have two languages, the so-called Upper (Lappish) and the Lower, the latter being spoken in Russian Lappland. ¹

¹ Bertillon found in one instance a cephalic index of 94. The average obtained by Pruner Rey was 84.7, by Virchow 82.5.

the phonetics are different and more complicated. It is broken up into very distinct and even mutually unintelligible dialects, the origin of several of which is, however, easily found in the political and social dismemberment of the people. Döben distinguishes four more or less distinct dialects, but as many more are spoken.

In Russian Lapland alone there are three, due to the influence of Norwegian, Karelian and Russian (Lünnrot, Acta Soc. Sci. Fennicae, vol. iv.). "The Lapps," says Castren, "have had the misfortune to possess a language which even at the present day is still in its tenderest infancy, and consequently it has not only adopted an endless number of foreign words, but in many grammatical aspects itself adapted after foreign models. That it began at a very early period to come into instruction with the Swedes is shown by the use it still makes of forms belonging to a linguistic stage older even than that of Icelandic. Döben has subjected the vocabulary to a very interesting analysis for the purpose of establishing what language the speech of the Lapps had reached before their contact with the Norse. Agricultural terms, the names of the metals and the words for farms or land are of Scandinavian origin, but very few are of modern (NAID, saxony, Gothenburg). The word for "taming" and "milk" would suggest the same source. The language of the Lapps is found very similar to the modern Sp. Lappish language, and may be traced back to a time when Scandinavia was covered by snow-fields and ice.

Language.

The language of the Lapps is still in a state of infancy. It is spoken with every imaginable grammatical variety, and it has been modified by the influence of other languages. It is not yet possible to trace the origin of the language, but the following points are generally agreed upon:

1. The language is closely connected with the Scandinavian languages.
2. The language is closely connected with the Finnish and the Eastern Slavonic languages.
3. The language is closely connected with the Old Norse language.

The language of the Lapps is closely connected with the Scandinavian languages. It is spoken with every imaginable grammatical variety, and it has been modified by the influence of other languages. LA PLATA, a city of Argentina and capital of the province of Buenos Aires, 5 m. inland from the port of Ensenada, or La Plata, and about 31 m. S.E. of the city of Buenos Aires, with which it is connected by rail. Pop. (1895) 45,600; (1900) 84,000. La Plata was founded in 1882, two years after Buenos Aires had been constituted a federal district and made the national capital. This necessitated the selection of another provincial capital, which resulted in the choice of an open plain near the former port of Ensenada de Barragán, on which a city was laid out after the plan of Washington. The streets are so wide that they seem out of proportion to the low brick buildings. The principal public buildings, constructed of brick and stucco, are the government-house, assembly building, treasury, municipal hall, cathedral, courts of justice, police headquarters, provincial museum and railway station. The museum, originally presented by Dr. Moreno, has become one of the most important in South America, its palaentological and anthropological collections being unique. There are also a university, national college, public library, astronomical observatory, several churches, two hospitals and two theatres. A noteworthy public park is formed by a large plantation of eucalyptus trees, which have grown to a great height and present an imposing appearance on the level, treeless plains. Electricity is in general use for public and private lighting, and tramways are laid down in the principal streets and extend eastward to the port. The harbour of La Plata consists of a large artificial basin, 1450 yds. long by 150 yds. wide, with approaches, in addition to the old port of Ensenada, which are capable of receiving the largest vessels that can navigate the La Plata estuary. Up to the opening of the new port works of Buenos Aires a large part of the ocean-going traffic of Buenos Aires passed through the port of La Plata. It has good railway connections with the interior, and exports cattle and agricultural produce.

LAPORTE, ROLAND (1675-1704), Camisard leader, better known as "Roland," was born at Mas Soubeyrans (Gard) in a cottage which has become the property of the Société de l'Histoire du Protestantisme français, and which contains relics of the history of the Camisards. He was a nephew of Laporte, the Camisard leader who was hunted down and killed in the Sba. October 1702, and he himself became the leader of a band of a thousand men which he formed into a disciplined army with magazines, arms and ammunition. For daring in action and rapidity of movement he was second only to Cavalier. These two leaders in 1702 secured entrance to the town of Sauve under the pretence of being royal officers, burnt the church and carried off provisions and ammunition for their forces. Roland, who called himself "general of the children of God," terrorized the country between Nîmes and Alais, burning churches and houses, and slaying those suspected of hostility against the Huguenots, though without personally taking any part of the spoil. Cavalier was already in negotiation with Marshal Villars when Roland cut to pieces a Catholic regiment at Fontmorte in May 1704. He refused to lay down his arms without definite assurance of the restoration of the privileges accorded by the Edict of Nantes. Villars then sought to negotiate, offering Roland the command of a regiment on foreign service and liberty of conscience, though not the free exercise of their religion, for his co-religionists. This parley had no results, but Roland was betrayed and captured, and on the 34th of August 1704 was shot while defending himself against his captors. The five officers who were with him surrendered, and were broken on the wheel at Nîmes. Roland's death put an end to the effective resistance of the Cévenols.

See A. Corté, Histoire des troubles des Cévennes (Villefranche, 1700); M. Baird, The Huguenots and the revocation of the Edict of Nantes (2 vols., London, 1805), and other literature dealing with the Camisards.
LAPARENT—LAPWING

of Macao. The arrangement is altogether abnormal, and was consented to by the Portuguese government in 1887 to assist the Chinese authorities in the suppression of opium smuggling. A similar arrangement prevails at the British colony of Hong-Kong, where the Chinese customs station is Kowloon. In both cases the customs stations levy duties on vessels entering and leaving the foreign port in lieu of levying them, as ought to be done, on entering or leaving a Chinese port.

LAPARENT, ALBERT AUGUSTE COCHON DE (1839-1908), French geologist, was born at Bourges on the 30th of December 1839. After studying at the École Polytechnique from 1858 to 1860 he became ingénieur au corps des mines, and took part in drawing up the geological map of France; and in 1875 he was appointed professor of geology and mineralogy at the Catholic Institute, Paris. In 1879 he prepared an important memoir for the geological survey of France on Le Pays de Bray, a subject on which he had already published several memoirs, and in 1880 he served as president of the French Geological Society. In 1881-1883 he published his Traité de géologie (5th ed., 1905), the best European textbook of stratigraphical geology. His other works include Cours de minéralogie (1884, 3rd ed., 1899), La géologie des combustibles minéraux (1886), Le Niveau de la mer et ses variations (1886), Les Tremblements de terre (1887), La Géologie en chemin de fer (1888). Précis de minéralogie (1888), Le Sède du fer (1890), Les Anciens Glaciers (1893), Leçons de géographie physique (1896), Notions générales sur l'écorce terrestre (1897), Le Globe terrestre (1899), and Science et apologétique (1905).

With Achille Delesse he was for many years editor of the Revue de géologie and contributed to the Extraits de géologie, and he joined with A. Potier in the geological surveys undertaken in connexion with the Channel Tunnel proposals. He died in Paris on the 5th of May 1908.

LAPPENBERG, JOHANN MARTIN (1794-1860), German historian, was born on the 30th of July 1794 at Hamburg, where his father, Valentin Anton Lappenberg (1759-1819), held an official position. He studied medicine, and afterwards history, at Edinburgh. He continued to study history in London, and at Berlin and Göttingen, graduating as doctor of laws at Göttingen in 1816. In 1820 he was sent by the Hamburg senate as resident minister to the Prussian court. In 1823 he became keeper of the collection of prints and drawings in the Prussian royal library, which gave him the full opportunities for the laborious and critical research work upon which his reputation as an historian rests. He retained this post until 1860, when a serious affection of the eye compelled him to resign. In 1850 he represented Hamburg in the German parliament at Frankfort, and his death took place at Hamburg on the 28th of November 1865. Lappenberg's most important work is his Geschichte von England, which deals with the history of England from the earliest times to 1154, and was published in two volumes at Hamburg in 1834-1837. It has been translated into English by B. Thorpe as History of England under the Anglo-Saxon Kings (London 1845, and again 1881), and History of England under the Norman Kings (Oxford, 1857), and has been continued in three additional volumes from 1154 to 1500 by R. Pauli. His other works deal mainly with the history of Hamburg, and include Hamburgische Chroniken in Niedersächsischer Sprache (Hamburg, 1832-1861); Geschichtsquellen des Erstehens und der Stadt Bremen (Bremen, 1841); Hamburgisches Urkundenbuch (Hamburg, 1842); and Hamburgische Geschichten des Hausen Stabkofers zu Hamburg (Hamburg, 1855). Lappenberg's works are still in great demand both in Germany and abroad.

LAPRADE, PIERRE MARTIN VICTOR RICHARD DE (1812-1883), known as Victor de Laprade, French poet and critic, was born on the 13th of January 1812 at Montbrison, in the department of the Loire. He came of a modest provincial family. After completing his studies at Lyons, he produced in 1830 a small volume of religious verse, Les Parfums de Madeleine. This was followed in 1840 by La Colère de Jésus, in 1841 by the religious fantasy of Psyché, and in 1844 by Odes et poèmes. In 1845 Laprade visited Italy on a mission of literary research, and in 1847 he was appointed professor of French literature at Lyons. The French Academy, by a single vote, preferred Émile Augier at the election in 1857, but in the following year Laprade was chosen to fill the chair of Alfred de Musset. In 1861 he was removed from his post at Lyons owing to the publication of a political satire in verse (Les Muses d'Étal), and in 1871 took his seat in the National Assembly on the benches of the Right. He died on the 13th of December 1883. A statue has been raised by his fellow-townsmen at Montbrison.

Besides those named above, Laprade's poetical works include Poèmes évangéiques (1852), Idylles héroïques (1858), Les Voix de silence (1864), Perrette (1868), Poèmes civiles (1873), Le Livre des passions (1876), Varia et Livres des oiseaux (1878-1879). In prose he published, in 1840, Des habitudes intellectuelles de l'Ascétique. Questions d'art et de morale appeared in 1861, succeeded by Le Sentiment de la nature, avant le Christianisme in 1866, and Chez les modernes in 1868, Éducation libérée in 1873. The material for these books had in some cases been printed earlier, after delivery as a lecture. He also contributed articles to the Revue des deux mondes and the Revue de Paris.

LAPRADE, DE

Laprade's prose criticisms must be ranked high. Apart from his classical and metaphysical studies, he was widely read in the literatures of Europe, and built upon the groundwork of a naturally correct taste. His dislike of irony and scepticism probably led him to underrate the product of the 18th century, and there are signs of a too fastidious dread of Philistinism. But a constant love of the best, a joy in nature and a lofty patriotism are not less evident than in his poetry. Few writers of any nation have fixed their minds so steadily on whatsoever things are pure, and lovely and of good report.

See also Edmond Birlé, Victor de Laprade, sa vie et ses œuvres.

LAPSE (Lat. lapsus, a slip or departure), in law, a term used in several senses. (1) In ecclesiastical law, when a patron has neglected to present to a vacant benefice within six months next after the avoidance, the right of presentation is said to lapse. In such case the patronage or right of presentation devolves from the neglectful patron to the bishop as ordinary from the metropolitan as superior and to the sovereign as patron paramount.

The failure of a testamentary disposition in favour of any person, by reason of the decease of its object in the testator's lifetime, is termed a lapse. See Legacy, Will.

LAPWING (O.Eng. hiedepiwicce = “one who turns in running or flight”) a bird, the Tringa vanellus of Linnaeus and the Vanellus vulgaris of V. crassitus of modern ornithologists.

1 Sketch, Etym. Dict. (1898), s.v. Caxton in 1481 has “lapwypche” (Reynard the Fox, cap. 27). The first part of the word is from nieder, to leap: the second part is “wink” (O.H.G. wichen, Ger. wanken, to waver). Popular etymology has given the word its present form, as if it meant “wing-flapper,” from “lap,” a fold or flap of a garment.
LAPWORTH—LAR

In the temperate parts of the Old World this species is perhaps the most abundant of the plovers, Charadrius, breeding in almost every suitable place from Ireland to Japan—the majority migrating towards winter to southern countries, as the Punjab, Egypt and Barbary—though in the British Islands some are always found at that season. As a straggler it has occurred within the Arctic Circle (as on the Varanger Fjord in Norway), as well as in Iceland and even Greenland; while it not unfrequently appears in Madeira and the Azores. Conspicuous as the strongly contrasted colours of its plumage and its very peculiar flight make it, it is remarkable that it maintains its ground when so many of its allies have been almost exterminated, for the lapwing is the object perhaps of greater persecution than any other European bird that is not a plunderer. Its eggs are the well-known "plovers' eggs" of commerce, and the bird, wary and wild at other times of the year, in the breeding-season becomes easily approachable, and is shot to be sold in the markets for "golden plovers." Its growing scarcity in Great Britain was very perceptible until the various acts for the protection of wild birds were passed. It is now abundant and is of service both for the market and to agriculture. What seems to be the secret of the lapwing holding its position is the adaptability of its nature to various kinds of localities. It will find sustenance equally on the dreist of soils as on the fattest pastures; upland and fen, arable and moorland, are alike to it, provided only the ground be open enough. The wailing cry and the frantic gestures of the cockpit bird in the breeding-season will tell any passer-by that a nest or brood is near; but, unless he knows how to look for it, nothing save mere chance will enable him to find it. The nest is a slight hollow in the ground, wonderfully inconspicuous even when deepened, as is usually the case, by incubation, and the black-spotted olive eggs (four in number) are almost invisible to the careless or untrained eye. The young when first hatched are clothed with mottled down, so as closely to resemble a stone, and to be overlooked as they squat motionless on the approach of danger. At a distance the plumage of the adult appears to be white and black in about equal proportions, the latter predominating above; but on closer examination nearly all the seeming black is found to be a bottle-green gleaming with purple and copper; the tail-coverts, both above and below, are of a bright bay colour, seldom visible in flight. The crest consists of six or eight narrow and elongated feathers, turned slightly upwards at the end, and is usually carried in a horizontal position, extending in the cock beyond the middle of the back; but it is capable of being erected so as to become nearly vertical. Faintening gradually the crest has also a few long barbs, a character that is remarkable for the peculiarity of its flight as far as of the above, the lapwing is far more often observed in nearly all parts of the British Islands than any other of the group Limicola. The peculiarity of its flight seems due to the wide and rounded wings it possesses, the steady and ordinarily somewhat slow flapping of which impels the body at each stroke with a manifest though easy jerk. Yet on occasion, as when performing its migrations, or even its almost daily transits from one feeding-ground to another, and still more when being pursued by a falcon, the speed with which it moves through the air is very considerable. On the ground this bird runs nimbly, and is nearly always engaged in searching for its food, which is wholly animal.

Allied to the lapwing are several forms that have been placed by ornithologists in the genera Holocephus, Chettusia, Lobivannella, Deylippia. In some of them the hind toe, which has already ceased to have any function in the lapwing, is wholly wanting. In others the wings are armed with a tubercle or even a sharp spur on the carpus. Few have any occipital crest, but several have the face ornamented by the outgrowth of a beak-shaped crested plate, and the tarsus is covered with more or less dense plumage. A few, like the lapwing, are found in most parts of the world, but perhaps the greater number in Africa. Europe has three species—Holocephus spinosus, the spur-winged plover, and Chettusia gregaria and C. leucura; but the first and last are only stragglers from Africa and Asia.

LAPWORTH, CHARLES (1842- ), English geologist, was born at Farringdon in Berkshire on the 30th of September 1842. He was educated partly in the village of Buckland in the same county, and afterwards in the training college at Culham, near Oxford (1862-1864). He was then appointed master in a school connected with the Episcopal church at Galashiels, where he remained eleven years. Geology came to absorb all his leisure time, and he commenced to investigate the Silurian rocks of the Southern Uplands, and to study the gravities and other processes which mark horizons in the great series of Lower Palaeozoic rocks. His first paper on the Lower Silurian rocks of Galashiels was published in 1870, and from that date onwards he continued to enrich our knowledge of the southern uplands of Scotland until the publication by the Geological Society of his masterly papers on The Moffat Series (1878) and The Giron Succession (1882). Meanwhile in 1875 he became an assistant master in the Madras College, St Andrews, and in 1881 professor of geology and mineralogy (afterwards geology and physiography) in the Mason College, now University of Birmingham. In 1882 he started work in the Durness-Eriboll district of the Scottish Highlands, and made out the true succession of the rocks, and interpreted the complicated structure which had baffled most of the previous observers. His results were published in "The Silurian Rocks of the Highlands of Scotland," 1883. In subsequent years his work includes papers on the Cambrian rocks of Nuneaton and the Ordovician rocks of Shropshire. The term Ordovician was introduced by him in 1870 for the strata between the base of the Lower Llandovery formation and that of the Lower Arenig; and it was intended to settle the confusion arising from the use by writers of Lower Silurian and by others of Upper Cambrian for the same set of rocks. The term Ordovician is now generally adopted. Professor Lapworth was elected F.R.S. in 1888, he received a royal medal in 1891, and was awarded the Wollaston medal by the Geological Society in 1899. He was president of the Geological Society, 1902-1904. His Intermediate Text-book of Geology was published in 1869.

See article, with portrait and bibliography, in Geol. Mag. (July 1901).

LAR, a city of Persia, capital of Laristan, in 30° 36' N., 54° 58' E., 180 m. from Shiraz and 75 from the coast at Bandar Lingah. It stands at the foot of a mountain range in an extensive plain covered with palm trees, and was once a flourishing place, but a large portion is in ruins, and the population which early in the 18th century numbered 50,000 is reduced to 8000. There are still some good buildings, of which the most prominent are the old bazaar consisting of four arcades each 180 ft. long, 14 broad and 22 high, radiating from a domed centre 30 ft. high, an old stone mosque and many cisterns. The crest of a steep limestone hill immediately behind the town and rising 150 ft. above the plain is crowned by the ruins of a castle formerly deemed imperceptible. Just below the castle is a well sunk 200 ft. in the

1 There is a prevalent belief that many of the eggs sold as "plovers" are those of rocks, but no notion can be more absurd, since the appearance of the two is wholly unlike. Those of the reddish, of the golden plover (to a small extent), and enormous numbers of those of the black-headed gull, and in certain places of some others, however, sold as lapwings, have a certain similarity of shell to the latter, and a difference of flavour only to be detected by a fine palate.

2 This sounds like pee-wit, with some variety of intonation. Hence the names pee-wit, peewit, and peewit, commonly applied in some parts of Britain to this bird—though the first is that by which one of the smaller gulls, Larus ridibundus (see GULL), is known in the districts it frequents. In Sweden Yppa, in Germany Kiebitz, in America it is called the Di, and in Ireland the lapwing, given to it from its usual cry. Other English names are green plover and hornpie—the latter from its long hornlike crest and pied plumage. The lapwing's conspicuous crest seems to have been the object of confusion among English writers of the middle ages, who translated the Latin word Uppa, property hoopoe, by lapwing, as being the crested bird with which they were best acquainted. In like manner other writers of the same or an earlier period, including the Latinized lapwing by Egeritis (plural), and rendered that again into English as egrets—the tuft of feathers misleading them also. The word Vanettiis is from vanus, the fan used for winnowing corn, and refers to the audible beating of the bird's wings.
Laramie is a supply and distributing centre for a live-stock raising and mining region—particularly coal mining, though gold, silver, copper and iron are also found. The Union Pacific Railroad Company has machine shops, repair shops and rolling mills at Laramie, and a short distance S. of the city, ice-houses and a tie-preserving plant. The manufactures include glass, leather, flour, plaster and pressed brick, the brick being made from shale obtained in the vicinity. The municipality owns and operates the water-works; the water is obtained from large springs about 2½ m. distant. Laramie was settled in 1868, by people largely from New England, Michigan, Wisconsin and Iowa, and was named in honour of Jacques Laramie, a French fur trader. It was first chartered as a city in 1868 by the legislature of Dakota, and was rechartered by the legislature of Wyoming in 1873.

**LARBERT**, a parish and town of Stirlingshire, Scotland. Pop. of parish (1901) 6500, of town, 1442. The town is situated on the Carron, 8 m. S. by E. of Stirling by the North British and Caledonian railways, the junction being an important station for traffic from the south by the West Coast route. Coal-mining is the chief industry. The principal buildings are the public library, a school for education of the deaf, the county-house, Stirling town hall, and a monument to the memory of the Battle of Stirling Bridge. The town is noted also for its picture-galleries.
difference no doubt arises from the tendency to extend the bounds of a delict and to limit the bounds of a crime. Thus it was *furtum* (but it would not be theft at English common law) to take a deposit of pledge contrary to the wishes of the owner, to retain goods found, or to steal a human being, such as a slave or *filius familias* (a special form of *furtum* called *plagium*). The latter would be in English law an abduction under certain circumstances but not a theft. One of two married persons could not commit *furtum* as against the other, but larceny may be so committed in England since the Married Women's Property Act 1882.

As a *furtum* was merely a delict, the *obligatio ex delicto* could be extinguished by agreement between the parties; this cannot be done in England. In another direction English law is more considerate of the rights of third parties than was Roman. The thief can give a good title to stolen goods; in Roman law he could not do so, except in the singlecase of a *hereditas* acquired by usucapio. The development of the law of *furtum* at Rome is historically interesting, for even in its latest period is found a relic of one of the most primitive theories of law adopted by courts of justice: *"They took as their guide the measure of vengeance likely to be exacted by an aggrieved person under the circumstances of the case. (Maine, Ancient Law, ch. x.) This explains the reason of the division of *furtum* into *manifestum* and *nemine manifestum.* The most recent thief was one taken red-handed—"*taken with the manner,*" in the language of old English law. The Twelve Tables denounced the punish- ment of death against the manifest thief, for that would be the penalty demanded by the indignant owner in whose place the judge stood. The severity of this penalty was afterwards mitigated by the praetor, who substituted for it the payment of quadruple the value of the thing stolen. The same penalty was also given by the praetor in case of theft from a fire or a wreck, or of prevention of theft. The Twelve Tables mulcted the non-manifest thief in double the value of the thing stolen. The actions for penalties were in addition to the action for the stolen goods themselves or their value. The quadruple and double penalties still remain in the legislation of Justinian. The search for stolen goods, as it existed in the time of Gaius, was a survival of a period when the injured person was, as in the case of summons (in jus vocatio), his own executive officer. Such a search, by the Twelve Tables, might be conducted in the house of the supposed thief by the owner in person, naked except for a cincture, and carrying a pila in his hand, safeguards apparently against any possi- bility of his making a false charge by depositing some of his own property on his neighbour’s premises. This mode of search became obsolete before the time of Justinian. Robbery (bona vi rapta) was violence added to *furtum.* In the *actus honorum reportus* quadruple the value could be recovered if the action were brought within a year, only the value if brought after the expiration of a year. The quadruple value included the stolen thing itself, so that the penalty was in effect only a triple one. It was inclusive, and not cumulative, as in *furtum.*

In England theft or larceny appears to have been very early regarded by legislators as a matter calling for special attention. The pre-Conquest compilations of laws are full of provisions on the subject. The earlier laws appear to regard it as a delict which may be compounded for by payment. Considerable distinctions of person are made, both in regard to the owner and the thief. Thus, by the laws of Æthelberht, if a freeman stole from the king he was to restore ninefold, if from a freeman or from a dwelling, threefold. If a thew stole, he had only to make a twofold reparation. In the laws of Alfred ordinary theft was still only civil, but he who stole in a church was punished by the loss of his hand. The laws of Ina named as the penalty death or redemption according to the wer-gild of the thief. By the same laws the thief might be slain if he fled or resisted. Gradually the severity of the punishment increased. By the laws of Æthelstan death in a very cruel form was inflicted. At a later date the *Leges Henrici Primi* placed a thief in the king’s mercy, and his lands were forfeited. Putting out the eyes and other kinds of mutilation were sometimes the punish- ment. The principle of severity continued down to the 19th century, and until 1872 theft or larceny of certain kinds re- mained capital. Both before and after the Conquest local jurisdiction over thieves was a common franchise of lords of manors, attended with some of the advantages of modern summary jurisdiction.

Under the common law larceny was a felony. It was affected by numerous statutes, the main object of legislation being to bring within the scope of the law larceny not larceny at common law, either because they were thefts of things which could not be larceny at common law, e.g. beasts *fereae naturae,* title deeds or choses in action, or because the common law regarded them merely as trespass for which the remedy was by civil action, e.g. fraudulent breaches of trust. The real nature of dealing with larceny appears to be the *Carta Foresta* of 1225, by which fine or imprisonment was inflicted for stealing the king’s deer. The next act appears to be the statute Westminster the First (1757), dealing with larceny and other such crimes as though the beginning of legislation on the subject was for the purposes of protecting the chases and parks of the king and the nobility. A very large number of the old acts are named in the repealing act of 1861. An act of the same date removed the old distinction between grand and petit larceny. The former was theft of goods above the value of twelve pence, in the house of the owner, not from the person, or by night, and was a capital crime. It was petit larceny when the value was twelve pence or under, the punishment being imprisonment or whipping. The value of money afforded good ground for Sir Henry Spelman’s sarcasm that, while everything else became dearer, the life of man became cheaper. The distinction between grand and petit larceny was abolished in 1913. The difference between the *Leges* of the First, c. 15, but it was not created for the first time by that statute. It is found in some of the pre-Conquest codes, as that of Æthelstan, and it is recognized in the *Leges Henrici Primi.* A distinction between grand and petit larceny is still found in the books. The latter is larceny accompanied by circumstances of aggravation, as that it is in a dwelling-house or from the person. The law of larceny is now contained chiefly in the Larceny Act 1861 (which extends to Ireland), a comprehensive enactment including larceny, embezzlement, picking the pockets of bankers, factors, and trustees, sacrilege, burglary, housebreaking, robbery, obtaining money by threats and’real pretences, and receiving stolen goods, and prescribing procedure, both civil and criminal. There are, however, other acts in force dealing with specific cases of larceny, such as an act of Henry VIII. as to stealing the goods of the king, and the Game, Post-Office and Merchant Shipping Acts. There are separate acts providing for larceny by a partner of partnership property, and by a husband or wife of the property of the other (Married Women’s Property Act 1882). Proceedings against persons subject to naval or military law depend upon the Naval Discipline Act 1866 and the Army Act 1881. There are several acts, both federal and admiralty, which contain the same enactments of law for the property is to be laid in aid of the British navy, and, in the case of vessels, for the enforcement of laws of and against persons engaged in the trades and at sea. The principal conditions which must exist in order to constitute larceny are these: (1) there must be an actual *nemine manifestum* to the person of the thief, though the smallest removal is sufficient; (2) there must be an owner of his property for an indefinite period, and to assume the entire dominion over it, an intent often described in Bracton’s words as *animus furandi;* (3) this intent must exist at the time of taking; (4) the thing taken must be one capable of larceny either at common law or by statute. One or two cases falling under the law of larceny have been of special interest. It was held more than once that a servant taking corn to feed his master’s horses, without any intention of appropriating it for his own, did not commit larceny. To remedy this hardship, the Misappropriation of Servants Act 1863 was passed to declare such an act not to be felony. The case of appropria- tion of goods which have been found has led to some difficulty. It seems to be the general rule that in order to constitute a larceny of lost goods there must be a felonious intent at the time of finding, that is, an intent to deprive the owner of them, coupled with reasonable means at the same time of knowing the owner. The mere existence of the goods when the owner has become known to the finder does not make the act larceny; independent value must be committed when the money is paid by mistake, if the prisoner took it *animus furandi.* In two noteworthy cases the question was argued before a very full court for crown cases reserved and in each case a difference of opinion. In R. v. Middleton, 1873, L. R. 2 C.C.R. 38, the prisoner, a de-positor in a post-office savings bank, received by the mistake of the clerk a larger sum that he was entitled to. The jury found that he did not know at the time of taking the money, and that he knew it to be the money of the postmaster-general. The majority of the court held it to be larceny. In a case in 1885 (R. v. Ainstew, L. R. 16 Q.B.D. 190), where the prosecutor gave the prisoner a sovereign believing it to be a shilling, and the prisoner

1 This provision was most unnecessarily repeated in the Larceny Act of 1861.
took it under that belief, but afterwards discovered its value and retained it, the court was equally divided as to whether the prisoner was guilty of larceny at common law, but held that he was not guilty of larceny as a bailee. Legislation has considerably affected the power of the state to impose the penalty. The incompatibilities of the common law rules of interpretation of indictments led to certain amendments of the law, now contained in the Larceny Act, for the purpose of avoiding the frequent failures of justice owing to the strict legal technicalities. Theft sentences were construed. Three larcenies of property of the same person within six months may now be charged in one indictment. On an indictment for larceny the prisoner may be found guilty of embezzlement, and vice versa; and if the prisoner pleads not guilty by false pretences, the offence turn out to be larceny, he is not entitled to be acquitted of the misdemeanour. A count for receiving may be joined with the count for stealing. In many cases it is unnecessary to allege or prove property to prove the act of receiving. The act also contains numerous provisions as to venue and the apprehension of offenders. In another direction the powers of courts of Summary Jurisdiction (q.v.) have been extended, in the case of receiving stolen goods, against children and young persons and against adults pleading guilty or waiving their right to trial by jury. The maximum punishment for larceny is fourteen years' penal servitude, but this can only be inflicted in certain exceptional cases, such as horse or cattle stealing and larceny by a servant or a person in the service of the crown or the police. The extreme punishment for simple larceny after a previous conviction for felony is ten years' penal servitude. Whipping may be part of the sentence on boys under sixteen.

Scotland.—A vast number of acts of the Scottish parliament dealt with larceny. The general policy of the acts was to make larceny what was not larceny at common law, e.g. stealing fruit, dogs, hawks or deer, and to extend the remedies, e.g. by giving the justiciary authority throughout the kingdom, by making the master in the case of theft by the servant liable to give the latter up to justice, or by allowing the use of firearms against thieves. The general result of legislation in England and Scotland has been to assimilate the law of larceny in both kingdoms. As a rule, what would be larceny in one would be larceny in the other.

United States.—The law depends almost entirely upon state legislation, and is in general accordance with that of England. The only acts of Congress bearing on the subject deal with larceny in the army and navy, and with larceny and receiving on the high seas or in any place under the exclusive jurisdiction of the United States, e.g. Alaska.

Alaska.—Stealing any goods, chattels, government note, bank note, or other thing in action, books of account, &c., is larceny; punishable, imprisonment for not less than one nor more than ten years. If the property is a dwelling-house, warehouse, steamship, church, &c., is punishable by imprisonment for not less than one nor more than seven years. Larceny of a horse, mule, ass, bull, steer, cow or reindeer is punishable by imprisonment for not less than one nor more than fifteen years. Wilfully altering or defacing marks or brands on such animals is larceny (Pen. Code, § 45, 1896).

Arizona.—Appropriating property found without due inquiry for the owner is larceny (Penal Code, § 442). "Dogs are property and of the value of one dollar each within the meaning of the terms 'property' and 'value' as used in this chapter" (id. § 448). Property includes a passage ticket though never issued. Persons stealing property and afterwards found to know that it was stolen and brought into Arizona, may be convicted and punished as if the offence was committed there (id. § 454). Stealing gas or water from a main is a misdemeanour.

Larceny includes among other things stealing larceny, gas or water from wires, meters or mains (L. 1903, ch. 327).

New York.—Larceny as defined by § 528 of the Penal Code includes also embezzlement, obtaining property by false pretences, and felonious larceny or stealing. Theft by embezzlement of public money, which is the basis of the charge of embezzlement, is considered to be a felony in New York (Kelton v. Heredia [1907] 90 Pac. Rep. 800). The courts have defined larceny to be the taking of property of another by stealth and by force not more than $500. If the property is over $500, the crime is grand larceny, punishable by imprisonment for not less than one nor more than fifteen years. There is a special section dealing with theft by bailee (Pen. Code, § 529). See also Article on EMBEZZLEMENT; FALSE PRETENCES; ROBBERY; STOLEN GOODS.

LARCH (from the Ger. Lärche, M.H.G. Larce, Lat. larix), a name applied to a small group of coniferous trees, of which the common larch of Europe is taken as the type. The members of the genus Larix are distinguished from the firs, with which they were formerly placed, by their deciduous leaves, scattered singly, as in Abies, on the young shoots of the season, but on older branches growing in whorl-like tufts, each surrounding the extremity of a rudimentary or abortive branch; they differ from cedars (Cedrus), which also have the fascicles of leaves on arrested branches, not only in the deciduous leaves, but in the cones, the scales of which are thinner towards the apex, and are persistent, remaining attached long after the seeds are discharged. The trees of the genus are closely allied in botanic features, as well as in general appearance, so that it is sometimes difficult to assign to them determinate specific characters, and the limit between species and variety is not always very accurately defined. Nearly all are natives of Europe, or the northern plains and mountain ranges of Asia and North America, though one (Larix Grifithii) occurs only on the Himalayas.

The common larch (L. europaea) is, when grown in perfection, a stately tree with tall erect trunk, gradually tapering from root to summit, and horizontal branches springing at irregular intervals from the stem, and in old trees often becoming more or less drooping, but rising again towards the extremities; the branches or side shoots, very slender and pendulous, are pretty thickly studded with the spurs each bearing a fascicle of thirty or more narrow linear leaves, of a peculiar bright light green when they first appear in the spring, but becoming of a more yellowish-green in autumn, and the flowers are very insignificant, being in sessile, nearly spherical catkins; the fertile ones vary in colour, from red or purple to greenish-white, in different varieties; the erect cones, which remain long on the branches, are above an inch in length and oblong-ovate in shape, with reddish-brown scales somewhat waved on the edges, the lower bracts usually rather longer than the scales. The tree flowers in April or May, and the winged seeds are shed the following autumn. When standing in an open space, the larch grows of a nearly conical...
LARCH

shape, with the lower branches almost reaching the ground, while those above gradually diminish in length towards the top of the trunk, presenting a very symmetrical form; but in dense woods the lower parts become bare of foliage, as with the firs under similar circumstances. When springing up among rocks or on ledges, the stem sometimes becomes much curved, and, with its spreading boughs and pendent branchlets, often forms a striking and picturesque object in alpine passes and steep ravinés. In the prevalent European varieties the bark is reddish-grey, and rather rough and scarred in old trees, which are often much lichen-covered. The trunk attains a height of from 80 to 140 ft., with a diameter of from 3 to 5 ft. near the ground, but in close woods is comparatively slender in proportion to its altitude. The larch abounds on the Alps of Switzerland, on which it flourishes at an elevation of 5000 ft., and also on those of Tirol and Savoy, on the Carpathians, and in most of the hill regions of central Europe; it is not wild on the Apennines.

Branchlet of Larch (Larix europaea).

in low sheltered situations. It is remarkably tough, resisting a bending strain better than any of the fir or pine woods in common use, though not as elastic as some; properly seasoned, it is as little liable to shrink as to split; the boughs being small compared to the trunk, the timber lags long enough to make it suitable for outdoor use in winter. A year after felling, the latter and the boughs are dried for six months to dry slowly and completely before sawing up the logs; the bark is removed, and the boughs are left for thirty months more, when they split and are ready for use. But, wondrously, the boughs remain firm and undecayed. The only drawback to these good qualities is that the wood is liable to warp and bend, unless very carefully seasoned; for this purpose it is recommended to be left for a year, with the boughs placed in water for one month, when it will be sufficiently seasoned. The boughs contain no knots and are not liable to break in use, as are those of other trees; the vitality of the wood is evidenced by the fact that it can be cut, even from the green tree, and yet remains as firm and vital as the wood of any other tree.

In the trunk of the larch, especially when growing in climates where the sun is powerful in summer, a fine clear turpentine exists in great abundance; in Savoy and the south of Switzerland, it is collected and sold, both for medicinal purposes and for use in the manufacture of varnish. The turpentine of Savoy is a mixture of common resin and manna, which occurs in small whitish droplets, which are removed in the morning before they are too much dried by the sun; this manna seems to differ little in composition from the sap of the tree, which also contains manna; its cathartic effects are unknown. The turpentine of Switzerland, however, is of a much higher quality, and is used in many countries for the manufacture of varnish, as well as for the manufacture of lacquer and the like. The turpentine of the European larch is not used for medicinal purposes, but is employed in France for the same purposes.

The bark of the larch is largely used in some countries for tanning; it is taken from the trunk only, being stripped from the trees when the rays are about equal to that of birch bark; but, according to the experience of British tanners, it is scarcely half as strong as that of the oak. The soft inner bark is occasionally used in Siberia as a ferment, by hunters and others, being boiled and mixed with

The wood of large trees is compact in texture, in the best varieties of a deep reddish colour varying to brownish-yellow, but apt to be lighter in tint, and less hard in grain, when grown in rich soils or

chain, or the Pyrenees, and in the wild state is unknown in the Spanish peninsula. It forms extensive woods in Russia, but does not extend to Scandinavia, where its absence is somewhat remarkable, as the tree grows freely in Norway and Sweden where planted, and even multiplies itself by self-sown seed, according to F. C. Schübler, in the neighbourhood of Trondhjem. In the north-eastern parts of Russia, in the country towards the Petchora river, and on the Ural, a peculiar variety prevails, regarded by some as a distinct species (L. sibirica); this form is abundant nearly throughout Siberia, extending to the Pacific coast of Kamchatka and the hills of the Amur region. The Siberian larch has smooth grey bark and smaller cones, approaching in shape somewhat to those of the American hackmatack; it seems even harder than the Alpine tree, growing up to latitude 65°, but, as the inclement climate of the polar shores is near, dwindling down to a dwarf and even trailing bush.

The larch, from its lofty straight trunk and the high quality of its wood, is one of the most important of coniferous trees; its growth is extremely rapid, the stem attaining a large size in from sixty to eighty years, while the tree yields good useful timber at forty or fifty; it forms fine heartwood at an early age, and the sapwood is less perishable than that of the firs, rendering it more valuable in the young state.

The wood of large trees is compact in texture, in the best varieties of a deep reddish colour varying to brownish-yellow, but apt to be lighter in tint, and less hard in grain, when grown in rich soils or
LARCH

rye-meal, and buried in the snow for a short time, when it is employed as a substitute for other leaven, and in making the sour liquor called "quass." In Germany a fungus (Polyporus Lariciis) grows on the roots and stems of decaying larches, which was formerly in widespread use as a substitute for hops. Some larch trees are employed for the making of the rugged, of this sort, as in Switzerland and Poland. To indicate the larch's interval, and to suggest the point of its growing period, the following is given. The larch, though mentioned by Parkinson in 1629 as "nursed up" by a few "lovers of variety" as a rare exotic, does not seem to have been much grown in England till early in the 18th century. In Scotland the date of its introduction is a disputed point, but it is known to have been planted at Dunkeld by the 2nd Duke of Athole in 1727, and about thirteen or fourteen years later considerable plantations were made at that place, the commencement of one of the largest planting experiments on record; it is estimated that 14 million larches were planted on the Athole estates between that date and 1826. The cultivation of the tree rapidly spread, and the larch has become a conspicuous feature of the scenery in many parts of Scotland. It grows as rapidly and attains as large a size in British habitats suited to it as in its home on the Alps, and often produces equally good timber. The larch of Europe is essentially a mountain tree, and requires not only free air above, but a certain moderate amount of moisture in the soil beneath, with, at the same time, perfect drainage. Adequate moisture is essential; where there is freedom from stagnant water in the ground, and abundant room for the spread of its branches to light and air, the larch will flourish in a great variety of soils, stiff clays, wet or mossy peat, and mossy turf, and alluvium being the chief exceptions; in its native localities it seems partial to the debris of primitive and metamorphic rocks, but is occasionally found growing luxuriantly on calcareous subsoils; in Switzerland it attains the largest size, and forms the best timber, on the northern declivities of the mountains; but in Scotland a southern aspect appears most favourable.

The best variety for culture in Britain is that with red female flowers; the light-flowered kinds are said to produce interior wood, and the Siberian larch does not grow in Scotland nearly as fast as the Alpine tree. The larch is raised from seed in immense numbers in British nurseries; that obtained from Germany is preferred, being more perfectly ripened than the cones of home growth usually are. The seeds are sown in April, on rich ground, which should not be too highly manured; the young larches are planted out when two years old, or sometimes transferred to a nursery bed to attain a larger size; but, like all conifers, they succeed best when planted young; on the mountains, the seedlings are usually put into a mere slit in the ground; the ground is usually turned up before being first cleared of any heath, bracken, or tall herbage that might smother the young tree; the plants should be from 3 to 4 ft. apart, or even more, according to the growth intended before thinning, which should be begun as soon as the boughs begin to overspread much, or the growing shoot is crowded; fire is the usual method of dead branches. The larch is said not to succeed on arable land, especially where corn has been grown, but experience does not seem to support this view: that against the previous occupation of the spot is the shearing habit, and, where timber is the object, it should not be planted with other conifers. On the Grampians and neighbouring hills the larch will flourish at a greater elevation than the pine, and will grow well at an altitude of 7000 or even 8000 ft.; but it attains its full size on lower slopes. In very dry and bleak localities, the Scotch fir will probably be more successful up to 900 ft. above the sea, the limit of the luxuriant growth of that hardy conifer in Britain; and in such districts the larch is a useful substitute for the spruce. The growth of the larch while young is exceedingly rapid; in the south of England it will often attain a height of 25 ft. in the first ten years, while in favourable localities it is reasonable to expect growth of 20 ft. in half a century. The larch responds to thinning, and will produce heartwood long after the fir. The felled sixty years after planting was 110 ft. high; but usually the tree does not increase so rapidly after the first thirty of forty years. Some larches in Scotland rival in size the most gigantic specimens of Sitka spruce; some attain a height of 120 ft.; some, at Blackwood, are said to be 170 ft. high. The larch is a hardy tree, and is planted for the benefit of the salmon fisheries in the north, and for the improvement of the scenery of the Highlands.

The young seedlings are sometimes nibbled by the hare and rabbit; and on parts of the highland hills both bark and shoots are eaten in the winter by the deer; larch woods should always be kept grizzled to keep down the deer. The larch is a species which can be raised from学生的, and is rarely attacked by fungi; the most important is the larch-canker caused by the parasitism of Peziza Willkommii. The spores germinate on a damp surface and enter the cortex through small cracks or wounds in the protecting layer; this fungus will go on growing in infinitely thin cambium layer, thus killing and destroying a larger area year by year. The most effective method of treatment is to cut out the diseased branch or patch as early as possible. Another disease which is more frequently caused by the fungus is the "heart-rot" of the larch; it occurs as two forms, one of which attacks only the trunk in a central position, while the other begins to swell slowly from the base; the trunk is attacked so slowly that it looks perfectly sound, but after some years the wood becomes heart-rotted, and the whole tree gradually goes off as the disease advances; when cut down, the trunk is found to be decayed at the centre, the "rot" usually commencing at the ground. This disease of the larch tree is caused by a species of Fomes, often showing little sign of unwholesomeness caused. Great difference of opinion exists among foresters as to the cause of this destructive malady; but it is probably the direct result of unsuitable soil, especially soil containing insufficient nourishment. The larch is very hardy, and will grow as far south as the latitude of Paris or for use in the dockyards, in addition to the large home supply. The quality varies much, as well as the colour and density; an Italian sample in the museum at Kew (of a very dark red tint) weighs about 4 lb. to the cubic foot, and has a density of 44 lb. 1 oz. to the cubic foot.

For the landscape gardener, the larch is a valuable aid in the formation of park and pleasure ground; but it is never seen to such advantage as when hedges or small trees are planted in belts or rocks. A single row would destroy the effect of the trees passing among the mountains. A variety with very pendent boughs, known as the "drooping" larch var. pendula, is occasionally met with in gardens.

The bark of the larch has been introduced into pharmacy, being given, generally, in the form of an alcoholic tincture, in chronic bronchitis affections and internal haemorrhages. It contains, in addition to tannin, a peculiar principle called larixin, which may be obtained in a pure state by distillation from a concentrated infusion of the bark. The larixin has a bitter and astringent taste, and a faint acid reaction; hence some term it laristic acid.

The European larch has long been introduced into the United States, where, in suitable localities, it flourishes as luxuriantly as in Britain. Plantations have been made in America with an economic view, the tree growing much faster, and producing good timber at an earlier age than the native hackmack (or tamarack), while the wood is less ponderous, and therefore more generally applicable.

The genus is represented in the eastern parts of North America by the hackmack (L. americana), of which there are several varieties, two so well marked that they are by some botanists considered specifically distinct. In one (L. microcarpa) the cones are very small, rarely exceeding 0.5 in. in length, of a roundish-oblong shape, the scale 2 or 3 in number, crimson in the young state, reddish-brown when ripe. The hackmack resembles the European larch in general appearance but is of more slender growth; its trunk is seldom more than 2 ft. in diameter and rarely above 80 ft. high; this form is the red larch, the pinette rouge of the French Canadians. The black larch (L. pendula) has rather larger cones, of an oblong shape, about 0.5 in. long, purplish or green in the immature state, and dark brown when ripe, the scales somewhat more numerous, the bracts all shorter than the scales. The bark is dark bluish-grey, smoother than in the red larch, on the trunk and lower boughs often glossy; the branches are more or less pendulous and very slender.
LARCHER—LARDNER, N.

The red larch grows usually on higher and drier ground, ranging from the Virginian mountains to the shores of Hudson Bay; the black larch is found on moist land, and even in swamps. The hackmatack is one of the most valuable timber trees of America; it is is plentiful in the swamps and for the St. Lawrence shipbuilding. It is far more durable than any of the oaks of that region, is heavy and close-grained, and much stronger, as well as more lasting, than that of the pines and firs of Canada. In many parts all the finer trees have been cut to make way for the large wood of the hackmatacks, and there are still accessible districts; it abounds especially near Lake St John, Quebec, and in Newfoundland is the prevalent tree in some of the forest tracts; it is likewise common in Maine and Vermont. In the timber and building yards the heart of the hackmatack is the kind preferred, the producer, probably, of L. microcarpus; the "grey" is less esteemed, but the varieties from which these woods are obtained cannot always be traced with certainty. Several fine specimens of the red larch exist in English parks, but its growth is much slower than that of L. laricina. The mountain larches of Newfoundland have elegant trees for the garden. The Hackmatack might perhaps be grown with advantage in places too wet for the common larch.

In western America a larch (L. occidentalis) occurs more nearly resembling L. europaeus. The leaves are shorter, thicker and more rigid than in any of the other larches; the cones are much larger than those of the hackmatacks, egg-shaped or oval in outline; the scales are of a fine red in the immature state, the bracts green and extending far beyond the scales in a rigid leaf-like point. The bark of the trunk has the same reddish tint as that of the common larch of Europe. It is the largest of all larches and one of the most useful timber trees of North America. Some of the trees are 350 ft. high and 6 to 8 ft. in diameter. The wood is the hardest and strongest of all the American conifers; it is durable and adapted for construction work or household furniture.

LARCHER, PIERRE HENRI (1768-1812). French classical scholar and archaeologist, was born at Dijon on the 12th of October 1768. Originally intended for the law, he abandoned it for the classics. His (anonymous) translation of Chariton's Chrestes and Callirrhoe (1795) marked him as an excellent Greek scholar. His attack upon Voltaire's Philosphie de l'histoire (published under the name of Abbé Bazin) created considerable interest at the time. His archaeological and mythological Mémoire sur Vénus (1775), which has been ranked with similar works of Heyne and Winckelmann, gained him admission to the Académie des Inscriptions (1778). After the imperial university was founded, he was appointed professor of Greek literature (1809) with Boissonade as his assistant. He died on the 22nd of December 1812. Larcher's best work was his translation of Herodotus (1786, new ed. by L. Humbert, 1880) on the preparation of which he had spent fifteen years. The translation itself, though correct, is dull, but the commentary (translated into English, London, 1829, new ed. 1849, by W. D. Cooley) dealing with historical, geographical and chronological questions, and enriched by a wealth of illustration from ancient and modern authors, is not without value.

See W. F. Wolf, Literarische Analegeton, i. 295; D. A. Wyttbach, Philologia, iii. (1817).

LARIUS (less accurately LARTIUS). TITUS, probably surmised Flavus, a member of an Etruscan family (cf. Lars Tolumnius, Lars Persena) early settled in Rome. When consul in 301 B.C. he was chosen dictator (the title and office being then introduced for the first time) to command against the thirty Latin cities, which had rebelled against Rome. Of the authorities put the appointment three years later, when the plebeians refused to serve against the Latinis until they had been released from the burden of their debts. He opposed harsh measures against the Latinis, and also interested himself in the improvement of the lot of the plebeians. His brother, Spurius, is associated with Horatius Coles in the defence of the Subilian bridge against the Etruscans.

See Livy ii. 10, 18, 21, 29; Dion. Halic. v. 50-77, vi. 37; Cicero, De Re Publica, ii. 32.

LARD (Fr. lard, from Lat. lardum, bacon fat, related to Gr. λαρδός fat, λαδός dainty or sweet), the melted and strained fat of the common hog. Properly it is prepared from the "leaf" or fat of the bowel and kidneys, but in commerce the term as applied to products which include fat obtained from other parts of the animal and sometimes containing no "leaf" at all. Lard of various grades is made in enormous quantities by the great pork-packing houses at Chicago and elsewhere in America. "Neutral lard" is prepared at a temperature of 40°-50° C. from freshly killed hogs; the finest quality, used for making oleomargarine, is got from the leaf, while the second, employed by biscuit and pastry bakers, is obtained from the fat of the back. Steam heat is utilized in extracting inferior qualities, such as "choice lard" and "prime steam lard," the source of the latter being any fat portion of the animal. Lard is a pure white fat of a butter-like consistence; its specific gravity is about 0.93, its solidifying point about 27°-30° C., and its melting point 35°-45° C. It contains about 60% of olein and 40% of palmitin and stearin. Adulteration is common, the substances used including "stearin" both of beef and of mutton, and vegetable oils such as cotton seed oil: indeed, mixtures have been sold as lard containing nothing but such adulterants. In the pharmacopoeia lard figures as adeps and is employed as a basis for ointments. Benzoated lard, used for the purpose, is prepared by heating lard with 3% of powdered benzoic for two hours; it keeps better than ordinary lard but has objectionable properties.

Lard is the limpid, clear, colourless oil expressed by hydraulic pressure and gentle heat from lard; it is employed for burning and for lubrication. Of the solid residue, lard "stearine," the best qualities are utilized for making oleomargarine, the inferior ones in the manufacture of candles.

LARDNER, DIOSYUS (1793-1839). Irish scientific writer, was born at Dublin on the 3rd of April 1793. His father, a solicitor, wished his son to follow the same calling. After some years of uneventful desk work, Lardner entered Trinity College, Dublin, and graduated B.A. in 1817. In 1828 he became professor of natural philosophy and astronomy at University College, London, a position he held till 1840, when he was made a fellow, and had to leave the country. After a lecturing tour through the principal cities of the United States, which realized £40,000, he returned to Europe in 1845. He settled at Paris, and resided there till within a few months of his death, which took place at Naples on the 20th of July 1859.

Though lacking in originality or brilliancy, Lardner showed himself to be a successful popularizer of science. He was the author of numerous mathematical and physical treatises on such subjects as algebraic geometry (1832), the differential and integral calculus (1825), the steam engine (1828), besides hand-books on various departments of natural philosophy (1834-1856); but it is as the editor of "Lardner's Penny Cyclopedia, 1830-1844" that he is best remembered. To this scientific library of 134 volumes many of the ablest savants of the day contributed, Lardner himself being the author of the treatises on arithmetic, geometry, heat, hydraulics and pneumatics, mechanics (in conjunction with Henry Kater) and various other subjects. Among these works are the "Cabinet Library" (12 vols., 1830-1832) and the "Museum of Science and Art" (12 vols., 1834-1836) are his other chief undertakings. A few original papers appear in the Royal Irish Academy's Transactions (1824), in the Royal Society's Proceedings (1831-1836) and in the Astronomical Society's Monthly Notices (1832-1855); and two reports to the British Association on railway constables (1838, 1841) are from his pen.

LARDNER, NATHANIEL (1664-1768), English theologian, was born at Hawkhurst, Kent. After studying for the Presbyterian ministry in London, and also at Utrecht and Leiden, he took holy orders as a preacher in 1700, but was not successful. In 1713 he entered the army as a tutor and domestic chaplain, where he remained until 1721. In 1724 he was appointed to deliver the Tuesday evening lecture in the Presbyterian chapel, Old Jewry, London, and in 1726 he became assistant minister to the Presbyterian congregation in Crutched Friars. He was given the degree of D.D. by Marischal College, Aberdeen, in 1745. He died at Hawkhurst on the 24th of July 1768.

An anonymous volume of Memoirs appeared in 1769; and a life by Andrew Kippis is prefixed to the edition of the Works of Lardner, published in 11 vols., 8vo in 1789, in 4 vols. 4to in 1817, and 10 vols. 8vo in 1827. The full title of his principal work—a work which, though now out of date, entitles his author to be regarded as the founder of modern critical research in the field of early Christian literature—is The Credibility of the Gospel History, or The Principal Facts of the New Testament confirmed by Passages of Ancient Authors.
LAREDO—LARES

who were contemporary with our Saviour or his Apostles, or lived near their time. Part i., in 2 vols. 8vo, appeared in 1727; the publication of part ii., in 12 vols. 8vo, began in 1733 and ended in 1755. In 1730 there was a second edition of part i., and the Additions and Alterations were published separately. A Supplement, however, appeared earlier. A History of the Apostles and Evangelists, Writers of the New Testament, was added in 3 vols. (1756-1757), and reprinted in 1760. Other works by Lardner are A Large Collection of Ancient Jewish and Heathen Traditions, and Christian Revelation, with Notes and Observations (4 vols., 4to, 1764-1767); The History of the Heretics of the two first Centuries after Christ, published posthumously in 1760 and a considerable number of occasional sermons.

LAREDO, a city and the county-seat of Webb county, Texas, U.S.A., and a sub-port of entry, on the Rio Grande opposite Nuevo Laredo, Mexico, and 150 m. S. of San Antonio. Pop. (1900) 13,429, of whom 6882 were foreign-born (mostly Mexicans) and 82 negroes; (1910 census) 14,855. It is served by the International & Great Northern, the National of Mexico, the Texas Mexican and the Rio Grande & Eagle Pass railways, and is connected by bridges with Nuevo Laredo. Among the principal buildings are the U.S. Government Building, the City Hall and the County Court House; and the city's institutions include the Laredo Seminary (1882) for boys and girls, the Mercy Hospital, the National Railroad of Mexico Hospital and an Ursuline Convent. Loma Vista Park (65 acres) is a pleasure resort, and immediately W. of Laredo on the Rio Grande is Fort McIntosh (formerly Camp Crawford), a United States military post. Laredo is a jobbing centre for trade between the United States and Mexico, and is a sub-port of entry in the Corpus Christi Customs District. It is situated in a good farming and cattle-raising region, irrigated by water from the Rio Grande. The principal crop is Bermuda onions; in 1900 it was estimated that 1500 acres in the vicinity were devoted to this crop, the average yield per acre being about 20,000 lb. There are coal mines about 25 m. above Laredo on the Rio Grande, and natural gas was discovered about 28 m. E. in 1908. The manufacture of bricks is an important industry. Laredo was named from the seaport in Spain, and was founded in 1767 as a Mexican town; it originally included what is now Nuevo Laredo, Mexico, and was long the only Mexican town on the left bank of the river. It was captured in 1846 by a force of Texas Rangers, and in 1847 was occupied by U.S. troops under General Lamar. In 1852 it was chartered as a city of Texas.

LA RÉOLE, a town of south-western France, capital of an arrondissement in the department of Girond, on the right bank of the Gironde, 38 m. S.E. of Bordeaux by rail. Pop. (1906) 3500. La Réole grew up round a monastery founded in the 7th or 8th century, which was reformed in the 11th century and took the name of Regula, whence that of the town. A church of the end of the 12th century and some of the buildings (18th century) are left. There is also a town hall of the 12th and 14th centuries. The town fortifications were dismantled by order of Richelieu, but remains dating from the 12th and 14th centuries are to be seen, as well as a ruined château built by Henry II. of England. La Réole has a sub-prefecture, a tribunal of first instance, a communal college and an agricultural school. The town is the centre of the district in which the well-known breed of Bazadais cattle is reared. It is an agricultural market, and carries on trade in the wine of the region together with liqueur distillery and the manufacture of casks, rope, brooms, &c.

LARES (older form Lases), Roman tutelary deities. The word is generally supposed to mean "lords," and identified with Etruscan larth, lar; but this is by no means certain. The attempt to harmonize the Stoic demonology with Roman religion led to the Lares being compared with the Greek "heroes" during the period of Greco-Roman culture, and the word is frequently translated house. In the later period of the republic they are confounded with the Penates (and other deities), though the distinction between them was probably more sharply marked in earlier times. They were originally gods of the cultivated fields, worshipped by each household where its allotment joined those of others (see below). The distinction between public and private Lares existed from early times. The latter were worshipped in the house by the family alone, and the household Lari (familiaris) was conceived of as the centre-point of the family and of the family cult. The word itself (in the singular) came to be used in the general sense of "home." It is certain that originally each household had only one Lar; theplural was at first only used to include other classes of Lares, and only gradually, after the time of Cicero, ousted the singular. The image of the Lari, made of wood, stone or metal, sometimes even of silver, stood in its special shrine (lararium), which in early times was in the atrium, but was afterwards transferred to other parts of the house, when the family hearth was removed from the atrium. In some of the Pompeian houses the lararium was represented by a niche only, containing the image of the lar. It was usually a youthful figure, dressed in a short, high-tilted tunic, holding in one hand a rhyton (drinking horn), in the other a patera (cup). Under the Empire we find usually two of these, one on each side of the central figure of the Genius of the head of the household, sometimes of Vesta, the hearth-deity. The whole group was called indifferently Lares or Penates. A prayer was said to the Lar every morning, and at each meal offerings of food and drink were set before him; a portion of these was placed on the hearth and afterwards shaken into the fire. Special sacrifices were offered on the kalends, nones, and ides of every month, and on the occasion of important family events. Such events were the birthday of the head of the household; the assumption of the laus viridis by a son; the festival of the Caristia in memory of deceased members of the household; recovery from illness; the entry of a young bride into the house for the first time; return home after a long absence. On these occasions the Lares were crowned with garlands, and offerings of cakes and honey, wine and incense, but especially swine, were laid before them. Their worship persisted throughout the pagan period, although its character changed considerably in later times. The emperor Alexander Severus had images of Abraham, Christ and Alexander the Great among his household Lares.

The public Lares belonged to the state religion. Amongst these must be included, at least after the time of Augustus, the Lares compitales. Originally two in number, mythologically the sons of Mercurius and Lara (or Larunda), they were the presiding deities of the cross-roads (compota), where they had their special chapels. It has been maintained by some that they are the twin brothers so frequent in early religions, the Romulus and Remus of the Roman foundation legends. Their sphere of influence included not only the cross-roads, but the whole neighbouring district of the town and country in which they were situated. They had a special annual festival, called Compitalia, to which public games were added some time during the republican period. When the colleges of freedmen and slaves, who assisted the presidents of the festival, were abolished by Julius Caesar, it fell into disuse. Its importance was revived by Augustus, who added to these Lares his own Genius, the religious personification of the empire.

The state itself had its own Lares, called praestites, the protecting patrons and guardians of the city. They had a temple and altar on the Via Sacra, near the Palatine, and represented in coins as young men wearing the chlamys, carrying lances, seated, with a dog, the emblem of watchfulness, at their feet. Mention may also be made of the Lares gruduales, whose worship was connected with the white sow of Alba Longa and its thirty young (the epithet has been connected with grunnire, to grunt); the viatae, who protected travellers; the hostiliis, who kept off the enemies of the state; the permarni, connected with the sea, to whom L. Aemilius Regillus, after a naval victory over Antiochus (190 B.C.), vowed a temple in the Campus Martius, which was dedicated by M. Aemilius Lepidus the censor in 179.

The old view that the Lares were the defied ancestors of the family has been rejected lately by Wissowa, who holds that the Lar was originally the protecting spirit of a man's lot of arable land, with a shrine at the compitum, i.e. the spot where the path bounding his arable met that of another holding; and thence found his way into the house.
LA RÉVÉLLIÈRE-LÉPEAUX—LARINO

LA RÉVÉLLIÈRE-LÉPEAUX, LOUIS MARIE DE (1755-1824), French politician, member of the Directory, the son of J. B. de la Revelliere, was born at Montaigu (Vendée), on the 24th of August 1755. The name of Lépeaux, he adopted from a small property belonging to his family, and he was known locally as M. de Lépeaux. He studied law at Angers and Paris, being called to the bar in 1775. A deputy to the states-general in 1789, he returned at the close of the session to Angers, where with his school-friends J. B. Lelecre and Urbain René Estre he sat on the council of Maine-et-Loire, and had to deal with the first Vendéen outbreaks. In 1792 he was returned by the department to the Convention, and on the 19th of November he proposed the famous decree by which France offered protection to foreign nations in their struggle for liberty. Although La Révellière-Lépeaux voted for the death of Louis XVI., he was not in general agreement with the extremists. Proscribed with the Girondins in 1793 he was in hiding until the revolution of 9 Thermidor (27th and 28th of July 1794). After serving on the Directoire, and the inauguration of the new constitution he became in July 1795 president of the Assembly, and shortly afterwards a member of the Committee of Public Safety. His name stood first on the list of directors elected, and he became president of the Directory. Of his colleagues he was in alliance with Jean François Rewbell and to a less degree with Barras, but the greatest of his fellow-directors, Lazare Carnot, was the object of his unyielding hatred. His policy was marked by a bitter hostility to the Christian religion, which he proposed to supplant as a civilizing agent by thephilanthropy, a new religion invented by the English deist David Williams. The credit of the coup d'état of 18 Fructidor (4th of September 1797), by which the allied directors made themselves supreme, La Révellière arrogated to himself in his Mémoires, which in this as in other matters must be read with caution. Complied to resign by the revolution of 10 Prairial (18th of June 1799) he lived in retirement in the country, and even after his return to Paris ten years later took no part in public affairs. He died on the 27th of March 1824.

The Mémoires of La Révellière-Lépeaux were edited by R. D'Angers (Paris, 3 vols., 1895). See also E. Charavay, La Révellière-Lépeaux et ses mémoires (1895) and A. Meyniéri, Un Représentant de la bourgeoisie angevine (1905).

LARGÈRIÈRE, a town of south-eastern France, capital of an arrondissement in the department of Ardèche, in the narrow valley of the Lignon, 20 m. S.W. of Privas by road. Pop. (1906) 1690. A church of the 11th, 13th and 15th centuries and the old castle of the bishops of Viviers, lords of Largentière, now used as a hospital, are the chief buildings. The town is the seat of a sub-prefect and of a tribunal of first instance; and has silk-mills, and carries on silk-spinning, wine-growing and trade in fruit and silk. It owes its name to sliver-mills worked in the vicinity in the middle ages.

LARGILLIÈRE, NICOLAS (1656-1746), French painter, was born at Paris on the 20th of October 1656. His father, a merchant, took him to Antwerp at the age of three, and while a lad he spent nearly two years in London. The attempt to turn his attention to business having failed, he entered, some time after his return to Antwerp, the studio of Gobau, quitting this at the age of eighteen to seek his fortune in England, where he was befriended by Eddy, who employed him for four years at Windsor. His skill attracted the notice of Charles II., who wished to retain him in his service, but the fury aroused against Roman Catholics by the Rye House Plot alarmed Largillière, and he went to Paris, where he was still received by Le Brun and Van der Meulen. In 1690, after remaining in his reduced circumstances as a portrait-painter, was soon established; his brilliant colour and lively touch attracted all the celebrities of the day—actresses, public men and popular preachers flocking to his studio. Huet, bishop of Avranches, Cardinal de Noailles, the Duclos and President Lambert, with his beautiful wife and daughter, are amongst his most noted subjects. It is said that James II. recalled Largillière to England on his accession to the throne in 1685, that he declined the office of keeper of the royal collections, but that, during a short stay in London, he painted portraits of the king, the queen and the prince of Wales. This last is impossible, for that of the prince did not take place till 1688; the three portraits, therefore, painted by Largillière of the prince in his youth must all have been executed in Paris, to which city he returned some time before March 1686, when he was received by the Academy as a member, and presented as his diploma picture the fine portrait of Le Brun, now in the Louvre. He was received as an historical painter; but, although he occasionally produced works of that class ("Crucifixion," engraved by Rouetters), and also treated subjects of still life, it was in historical portraits that he excelled. Horace Walpole states that he left in London those of Pierre van der Meulen and of Sybrevet. Several of his works are at Versailles. The church of St Étienne du Mont at Paris contains the finest example of Largillière's work when dealing with large groups of figures; it is an ex voto offered by the city to St Geneviève, painted in 1694, and containing portraits of all the leading officers of the republic. Largillière passed through every post of honour in the Academy, until in 1743 he was made chancellor. He died on the 20th of March 1746. Jean Baptiste Oudry was the most distinguished of his pupils. Largillière's work found skillful interpreters in Van Schuppen, Edelinck, Desplaces, Drevet, Pitou and other engravers.

LARGUS, a police burgh and watering place of Ayrshire, Scotland. Pop. (1901) 3246. It is situated 43 m. W. by S. of Glasgow by the Glasgow & South-Western railway. Its fine beach and dry, bracing climate have attracted many wealthy residents, and the number of summer visitors is also large. The public buildings include the Clark hospital, the Victoria infirmary convalescent home and the Stevenson institute and mechanics' library. Skelmorlie Aisle, the sole relic of the present parish church of St Columba, was converted into a mausoleum in 1636. Near it a mound covers remains, possibly those of the Norwegians who fell in the battle (1265) between Alexander III. and Haco, king of Norway. The harbour is used mainly by Clyde passenger steamers and yachts. From the quay a broad esplanade has been constructed northwards round the bay, and there is an excellent golf course. Kelburne Castle, 2 m. S., a seat of the earl of Glasgow, stands in romantic scenery. Fairlie, 3 m. S., another seaside resort, with a station on the Glasgow & South-Western railway, is the connecting-point for Milport on Great Cumbrae. Once a fishing village, it has acquired a great reputation for its yachts.

LARGUS, SCIBONIUS, court physician to the emperor Claudius. About A.D. 47, at the request of Gaius Julius Caligula, the emperor's freedman, he drew up a list of 271 prescriptions (Compositiones), most of them his own, although he acknowledged his indebtedness to his tutors, to friends and to the writings of eminent physicians. Certain old wives' remedies are also included. The work has no pretensions to style, and contains many colloquialisms. The greater part of it was transferred without acknowledgment to the work of Marcellus Empiricus (c. 410), De Medicamentis Empiriciis, Physici, et Rationabilibus, which is of great value for the correction of the text of Largus. See the edition of the Compositiones by G. Helmreich (Teubner series, 1887).

LARINO (anc. Larinum) a town and episcopal see of the Molise (province of Campobasso), Italy, 32 m. N.E. of Campobasso by rail (20 m. direct), 884 ft. above sea-level. Pop. (1901) 7044. The cathedral, completed in 1319, has a good Gothic façade; the interior has to some extent been spoilt by later restoration. The campanile rests upon a Gothic arch erected in 1457. The Priorato Continale has a courtyard of the 16th century. That the ancient town (which is close to the modern) existed before the Roman supremacy had extended so far is proved by the coins. It lay in the 2nd Augustan region (Apulia), but the people belonged to the Frontanni by race. Its strong position gave
it importance in the military history of Italy from the Hannibal wars onwards. The town was a municipium, situated on the main road to the S.E., which left the coast at Histionon (Vasto) and ran from Larinum E. to Spolontum. From Larinum a branch road ran to Bovianum Vetus. Remains of its city walls, of its amphitheatre and also of baths, &c., exist, and it did not cease to be inhabited until after the earthquake of 1300, when the modern city was established. Cluentius, the client of Cicero, who delivered a speech in his favour, was a native of Larinum, his father having been praetor of the allied forces in the Social War.

T. As)

LARRISSA (Turk. Yeni Shehr, “new town”), the most important town of Thessaly, situated in a rich agricultural district on the right bank of the Salamandra (Peneios, Peneus, Peneius), about 35 m. N.W. of Volo, with which it is connected by rail. Pop. (1899) 13,610, (1901) 18,007. Till 1881 it was the seat of a pusha in the vilayet of Jannina; it is now the capital of the Greek province and the seat of a nomarch. Its long subjection to Turkey has left little trace of antiquity, and the most striking features in the general aspect of the town are the faded mosques (mostly lately built) and the Mahomedan burying-grounds. It was formerly a Turkish military centre and most of the people were of Turkish blood. In the outskirts is a village of Africans from the Sudan—a curious remnant of the forces collected by Ali Pasha. The manufactures include Turkish leather, cotton, silk and tobacco; trade and industry, however, are far from prosperous, though improving owing to the immigration of the Greek commercial element. Fears and agues are prevalent owing to bad drainage and the overflowing of the river; and the death-rate is higher than the birth-rate. A considerable portion of the Turkish population emigrated in 1881; a further exodus took place in 1898. The department of Larissa had in 1907 a population of 93,066.

Larissa, written Larisa on ancient coins and inscriptions, is near the road from Thessaly to Argos. It appears in early times, when Thessaly was mainly governed by a few aristocratic families, as an important city under the rule of the Akeiades, whose authority extended over the whole district of Pelagia. This powerful family possessed for many generations before 369 B.C. the privilege of furnishing the Tagus, or generalissimo, of the combined Thessalian forces. The principal rivals of the Akeiades were the Scopaei of Crennon, the remains of which are by the Turks of Larissa discussed above (p. 273). The inhabitants sided with Athens during the Peloponnesian War, and during the Roman invasion their city was of considerable importance. Since the 5th century it has been the seat of an archbishop, who has now fifteen suffragans. Larissa was the headquarters of Ali Pasha during the Greek War of Independence, and of the crown prince Constantine during the Greco-Turkish War: the flight of the Greek army from this place to Pharsala took place on the 23rd of April 1897. Notices of some ancient inscriptions found in Larissa are given by Müller in Milangues philologiques (Paris 1880); several sepulchral relics were found in the neighbourhood in 1892. A few traces of the ancient acropolis and theatre are still visible.

The name Larissa was common to many "Pelasgian" towns, and apparently signified a fortified city or burg, such as the citadel of Argos. Another town of the name in Thessaly was Larissa Cremaste, surnamed Pelasgia (Strabo x. p. 410), situated on the slopes of Mt. Othros (H. I. 18). LARÍSTAN, a sub-province of the province of Fars in Persia, bounded E. and N.E. by Kerman and S. by the Persian Gulf. It lies between 26° 30’ and 28° 25’ N. and between 52° 30’ and 55° 30’ E. and has an extreme breadth and length of 120 and 210 m. respectively, with an area of about 20,000 sq. m. Pop. about 90,000. Laristan consists mainly of mountain ranges in the north and east, and of arid plains varied with rocky hills and sandy valleys stretching thence to the coast. In the highlands, where some fertile upland tracts produce corn, dates and other fruits, the climate is genial, but elsewhere it is extremely sultry, and on the low-lying coast lands malariaous. Good water is everywhere so scarce that but for the rain preserved in cisterns the country would be mostly uninhabitable. Many cisterns are infested with Guinea worm (filaria medinensis, Gm.). The coast is chiefly occupied by Arab tribes who were virtually independent, paying merely a nominal tribute to the shah’s government until 1868. They reside in small towns and mud forts scattered along the coast. The people of the interior are mostly of the old Iranian stock, and there are also a few nomads of the Turkish Baháí tribe which came to Persia in the 12th century when the province was subdued by a Turkish chief. Laristan remained an independent state under a Turkish ruler until 1602, when Shah Ibrahim Khan was deposed and put to death by Shah Abbas the Great. The province is subdivided into eight districts: (1) Lar, the capital and environs, with 34 villages; (2) Bikhah Ishsam with 11; (3) Bikhah Fal with 10; (4) Jahangiriyeh with 30; (5) Shikibuh with 36; (6) Fumistan with 13; (7) Kauristan with 4; (8) Mazayijan with 6 villages. Lingah, with its principal place Bandar Lingah and 11 villages, formerly a part of Laristan, is now included in the “Central Persian Gulf,” a separate administrative division. Laristan is famous for the condiment called māhībēh (fish-jelly), a compound of pounded small sprat-like fish, salt, mustard, nutmeg, cloves and other spices, used as a relish with nearly all foods.

LARIVEY, PIERRE (c. 1550-1612), French dramatist, of Italian origin, was the son of one of the Giunta, the famous printer of Florence and Venice. The family was established at Troyes and had taken the name of Larivey or L’Arrivé, by way of translation from giunto. Pierre Larivey appears to have cast horoscopes, and to have acted as clerk to the chapter of the church of St Étienne, of which he eventually became a canon. He has no claim to be the originator of French comedy. The Corrives of Jean de la Taille dates from 1562, but Larivey naturalized the Italian comedy of intrigue in France. He adapted, rather than translated, twelve Italian comedies into French prose. The first volume of the Comédies facétieuses appeared in 1579, and the second in 1611. Only nine in all were printed. The licence of the manners depicted in these plays is matched by the coarseness of the expression. Larivey’s merit lies in the use of popular language in dialogue, which often rises to real excellence, and was not without influence on Molière and Regnard. Molière’s L’Avoir owes something to the scene in Larivey’s masterpiece, Les Espirs, where Séverin laments the loss of his purse, and the opening scene of the piece seems to have suggested Regnard’s Retour imprévu. It is uncertain whether Larivey’s plays were represented, though they were evidently written for the stage. In any case prose comedy gained very little ground in popular favour before the time of Molière. Larivey was the author of many translations, varying in subject from the Facétieuses nuit (1573) of Straparola to the Humanité de Jésus-Christ (1604) from Pietro Aretino.

LARK (O. Eng. lâurcur, Ger. Lerche, Dan. Laæker, Dutch Leeuwerik), a bird’s name used in a rather general sense, the specific meaning being signified by a prefix, as skylark, titlark, woodlark. It seems to be nearly conterminous with the Latin Alauda as used by older authors; and, though this was to some extent limited by Linnaeus, several of the species included by him under the genus he so designated have long since been referred elsewhere. By Englishmen the word lark, used without qualification, almost invariably means the skylark, Alauda arvensis, which, as the best-known and most widely spread species throughout Europe, has been invariably considered as one of the genus. Of all birds it holds unquestionably the foremost place in English literature. It is one of the most favourite cage birds, as it will live for many years in captivity, and, except in the season of moult, will pour forth its thrilling song many times in an hour for weeks or months together. The skylark is probably the most plentiful of the class in western Europe. Not only does it frequent almost all unwooded districts in that quarter of the globe, but, unlike most birds, its numbers increase with the spread of agricultural improvement. Nesting chiefly in the growing corn, its eggs and young are protected in a great measure from molestation; and, as each pair of birds will rear several broods...
in the season, their produce on the average may be set down as at least quadrupling the original stock—the eggs in each nest varying from five to three. Young larks leave their birthplace as soon as they can shift for themselves. When the stubbles are cleared, old and young congregate in flocks.

In Great Britain in the autumn they give place to others coming from more northerly districts, and then as winter succeeds in great part vanish, leaving a tithe of the numbers previously present. On the approach of severe weather great flocks arrive from the continent of Europe. On the east coast of both Scotland and England this immigration has been noticed as occurring in a constant stream for as many as three days in succession. Farther inland the birds are observed “in numbers simply incalculable,” and “in countless hundreds.” In these migrations enormous numbers are netted for the markets, but the rate of reproduction is so rapid, and the conditions of life so favourable in Europe that there is no reason to fear any serious diminution in the numbers of the species.

The skylark’s range extends across the Old World from the Faeroe to the Kurile Islands. In winter it occurs in North China, Nepal, the Punjab, Persia, Palestine, Lower Egypt, and Barbary. It sometimes strays to Madeira, and has been killed in Bermuda, though its unassisted appearance there is doubtful. It has been successfully introduced on Long Island, in the state of New York, into Hawaii and into New Zealand—in which latter it has become as troublesome a denizen as are some other subjects upon which acclimatization societies have exercised their activity.

Allied to the skylark a considerable number of species have been described, of which perhaps a dozen may be deemed valid, besides a supposed local race, *Alauda agrestis*, the difference between which and the normal bird is shown in the annexed woodcut (fig. 1), kindly sent to this work by H. E. Dresser, in whose *Birds of Europe* it is described at length. These are found in various parts of Africa and Asia.

The woodlark, *Lullula arborea*, is a much more local and, therefore, a far less numerous bird than the skylark, from which it may be easily distinguished by its finer bill, shorter tail, more spotted breast and light superciliary stripe. Though not actually inhabiting woods, as its common name might imply, it is seldom found far from trees. Its song wants the variety and power of the skylark’s, but has a resonant sweetness peculiarly its own. The bird, however, requires much care in captivity. It has by no means so wide a range as the skylark, and perhaps the most eastern locality recorded for it is Erzerum, while its appearance in Egypt and even in Algeria must be accounted rare.

Not far removed from the foregoing is a group of larks characterized by a larger crest, a stronger and more curved bill, a rufous lining to the wings, and some other minor features. This group has been generally termed *Galeria*, and has for its type the crested lark, *Alauda cristata* of Linnaeus, a bird common enough in parts of France and some other countries of the European continent, and one which has been obtained several times in the British Islands. Many of the birds of this group frequent the borders if not the interior of deserts, and such as do so exhibit a more or less pale coloration, whereby they are assimilated in hue to that of their haunts. The same characteristic may be observed in several other groups—especially those known as belonging to the genera *Calandrella*, *Ammonites* and *Certhilauda*, some species of which are of a light sandy or cream colour. The genus last named is of very peculiar appearance, presenting in some respects an extraordinary resemblance to the hoopoes, so much so that the first specimen described was referred to the genus *Upupa*, and named *U. alaudipes*. The resemblance, however, is merely one of analogy.

There is, however, abundant evidence of the susceptibility of the Alaudine structure to modification from external circumstances—in other words, of its plasticity; and perhaps no homogeneous group of *Passeres* could be found which better displays the working of natural selection. Almost every character that among Passerine birds is accounted most sure is in the larks found subject to modification. The form of the bill varies in an extraordinary degree. In the woodlark (fig. 2, A), already noticed, it is almost as slender as a warbler’s; in *Ammonites* it is short; in *Certhilauda* (fig. 2, B) it is elongated and curved; in *Pyrrhulauda* and *Melanocorypha* (fig. 3, A) it is stout and finchlike; while in *Rhamphocorys* (fig. 3, B) it is exaggerated to an extent that surpasses almost any Fringilline form, exceeding in its development that found in some members of the perplexing genus *Paradoxornis*, and even presenting a resemblance to the same feature in the far-distant *Anastomus*—the toma of the maxilla not meeting those of the mandibula along their whole length, but leaving an open space between them. The hind claw, generally greatly elongated in larks, is in *Calandrella* (fig. 4) and some other genera reduced to a very moderate size. The wings exhibit almost every modification, from the almost entire abortion of the first primary in the skylark to its considerable development (fig. 5), and from tertials and scapulars of ordinary length to the extreme elongation found in the *Motaciliidae* and almost in certain *Limicolae*. The most constant character indeed of the *Alaudidae* would seem to be that afforded by the *podolobus* or covering of the tarsus, which is scutellate behind as well as in front, but a character easily overlooked.1

1 By assigning far too great an importance to this superficial character (in comparison with others), C. J. Sundeval (*Entomem*, pp. 53–63) was induced to array the larks, hoopoes and several other heterogeneous groups in one “series,” to which he applied the name of *Scutelliplantares*.
LARKHALL—LA ROCHE

219

Palaearctic, Ethiopian and Indian regions; but only one genus, "Mizrafa," inhabits Australia, where it is represented by a single species, *M. corsfieldii*; and there is no true lark indigenous to New Zealand. In the New World there is also only one genus, *Otocorys,* where it is represented by many races, some of which closely approach the Old World shore-lark, *O. alpestris.* The shore-lark is in Europe a native of only the extreme north, but is very common near the shores of the Varanger Fjord, and likewise breeds on mountain-tops farther south-west, though still well within the Arctic circle. The mellow tone of its call-note has obtained for it in Lapland a name signifying "bell-bird," and the song of the cock is lively, though not very loud. The bird trustfully resorts to the neighbourhood of houses, and even enters the villages of East Finnmark in search of its food. It produces at least two broods in the season, and towards autumn migrates to lower latitudes in large flocks. These have been observed in winter on the east coast of Great Britain, and the species instead of being regarded, as it once was, in the light of an accidental visitor to the United Kingdom, must now be deemed an almost regular visitor, though in very varying numbers. The observations on its habits made by Audubon in Labrador have long been known, and often reprinted. Other congeners of this bird are the *O. picaeum* of south-eastern Europe, Palestine and central Asia—to which are referred by H. E. Drescher ("B. Europe," iv. 401) several other forms originally described as distinct. All these birds, which have been termed horned larks, from the tuft of elongated black feathers growing on each side of the head, form a little group easily recognized by their peculiar coloration, which calls to mind some of the ringed plovers, *Aegialitis.*

The name of lark is also frequently applied to many birds which do not belong to the *Alaudidae* as now understood. The mud-lark, rock-lark, tit-lark and tree-lark are pipits (q.v.). The grasshopper-lark is one of the aquatic warblers (q.v.), while the so-called meadow-lark of America is *Icterus* (q.v.). Sand-lark and sea-lark are likewise names often given to some of the smaller members of the *Limicolae.* Of the true larks, *Alaudidae,* there may be perhaps about one hundred species, and it is believed to be a physiological character of the family that they moult but once in the year, while the pipits, which in general appearance much resemble them, undergo a double moult, as do others of the *Melanocoryphidae,* to which they are most nearly allied. (A. N.)

LARKHALL, a mining and manufacturing town of Lanarkshire, Scotland, near the left bank of the Clyde, 1 m. S.E. of Glasgow by the Caledonian railway. Pop. (1901) 11,879. The highest bridge in Scotland has been thrown across the river Avon, which flows close by. Brick-making is carried on at several of the adjoining collieries. Other industries include bleaching, silk-weaving, fire-clay and enamelling works, and a sanitary appliances factory. The town has a public hall and baths.

LARKHANA, a town and district of British India, in Sind, Bombay. The town is on a canal not far from the Indus, and has a station on the North-Western railway, 281 m. N. by E. of Karachi. It is pleasantly situated in a fertile locality, and is well laid out with wide streets and spacious gardens. It is a centre of trade, with manufactures of cotton, silk, leather, metal-ware and paper. Pop. (1901) 14,543.

The District of Larkhana, lying along the right bank of the Indus, was formed out of portions of Sukkur and Karachi districts in 1901, and has an area of 5001 sq. m.; pop. (1901) 626,085, showing an increase of 17% in the decade. Its western part is mountainous, but the remainder is a plain of alluvium watered by canals and well cultivated, being the most fertile part of Sind. The staple grain-crops are rice, wheat and millets, which are exported, together with wool, cotton and other agricultural produce. Cotton cloth, carpets, salt and leather goods are manufactured, and dyeing is an important industry. The district is served by the North-Western railway.

LARKSPUR, in botany, the popular name for species of *Dolphinum,* a genus of hardy herbaceous plants belonging to the natural order Ranunculaceae (q.v.). They are of erect branching habit, with the flowers in terminal racemes, often of considerable length. Blue is the predominating colour, but purple, pink, yellow (*D. Zalii* or *sulphureum*), scarlet (*D. cardinale*) and white also occur; the spur is produced by the elongation of the upper sepal. The field or rocket larkspur (*D. Ajacis*), the branching larkspur (*D. consolida*), *D. cardio-petala* and their varieties, are charming annuals; height about 18 in. The spotted larkspur (*D. regius*) and a few others are biennials. The perennial larkspurs, however, are most gorgeous of the family. There are numerous species of this group, natives of the old and new worlds, and a great number of varieties, raised chiefly from *D. exaltatum,* *D. formosum* and *D. grandiflorum.* Members of this group vary from 2 ft. to 6 ft. in height.

The larkspurs are of easy cultivation, either in beds or herbaceous borders; the soil should be deeply dug and manured. The annual varieties are best sown early in April, where they are intended to flower, and suitably thinned out as growth is made. The perennial kinds are increased by the division of existing plants in spring, or by cuttings taken in spring or autumn and rooted in pots in cold frames. The varieties cannot be perpetuated with certainty by seed. Seed is the most popular means, however, of raising larkspurs in the majority of gardens, and is suitable for all ordinary purposes; it should be sown as soon as gathered, preferably in rows in nursery beds, and the young plants transplanted when ready. They should be fit for the borders in the spring of the following year, and if strong, should be planted in groups about 3 ft. apart. Delphiniums require exposure to light and air. Given plenty of space in a rich soil, the plants rarely require to be staked except in windy localities.

LARNACA, Larnica or Larneca (anc. *Citium,* Turk. *Tuzla*), a town of the island of Cyprus, at the head of a bay on the south coast, 23 m. S.S.E. from Nicosia. Pop. (1901) 7964. It is the principal port of the island, exporting barley, wheat, cotton, raisins, oranges, lemons and gypsium. There is an iron pier 450 ft. long, but vessels anchor in the bay in from 16 to 70 ft. of water. Larnaca occupies the site of the ancient *Citium,* but the citadel of the ancient city was used to fill up the ancient harbour in 1879. The modern and principal residential part of the town is called Scala; Mycenaean tombs and other antiquities have been found (see CYPRESS).

LA ROCHE, a small town in the Belgian Ardennes, noticeable for its antiquity and its picturesque situation. Pop. (1904) 2065. Its name is derived from its position on a rock commanding the river Ourthe, which meanders round the little place, and skirts the rock on which are the interesting ruins of the old castle of the 11th century. This is supposed to have been the site of a hunting box of Pippin, and certainly the courts of *La Roche* held it in fief from his descendants, the Carolingian rulers. In the 12th century they sold it to the counts of Luxembourg. In the 16th and 17th centuries the French and Imperialists frequently fought in its neighbourhood, and at Tenneville, not far distant, is shown the tomb of an English officer named Barnwell killed in one of these encounters in 1692. La Roche is famous as a tourist centre on account of its fine sylvan scenery. Among the local curiosities is the Diable-Château, a freak of nature, being the apparent replica of a medieval castle. La
Roche is connected by steam tramway with Melreux, a station on the main line from Marloie to Liége.

**La Rochefoucauld** is the name of an old French family which is derived from a castle in the province of Angoumois (department of Charente), which was in its possession in the 11th century. François de La Rochefoucauld (1494-1577), godson of King Francis I., was made count in 1515. At the time of the wars of religion the family fought for the Protestant cause. François (1588-1650) was created duke and peer of France by Louis XIII, in 1622. His son François was the author of the *Maxims*, and the son of the latter acquired for his house the estates of La Roche-Guyon and Liancourt by his marriage with Jeanne Charlotte du Plessis-Liancourt. Alexandre, duc de La Rochefoucauld (d. 1762), left two daughters, who married into the Roye branch of the family. Of the numerous branches of the family the most famous are those of Roucy, Roye, Bayers, Doudouville, Randan and Estissac, which all furnished distinguished statesmen and soldiers.

**La Rochefoucauld, François de** (1613-1680), the greatest maxim writer of France, one of her best memoir writers, and perhaps the most complete and accomplished representative of her ancient nobility, was born at Paris in the Rue des Petits Champs on the 15th of September 1613. The author of the *Maxims*, who during the lifetime of his father (see above) and part of his own most stirring years bore the title of prince de Marcillac, was somewhat neglected in the matter of education, at least of the scholastic kind; but he joined the army before he was sixteen, and almost immediately began to make a figure in public life. He had been nominally married a year before to Andrée de Vivonne, who seems to have been an affectionate wife, while not a breath of scandal touches her—two points in which La Rochefoucauld was perhaps more fortunate than he deserved. For some years Marcillac continued to take part in the annual campaigns, where he displayed the utmost bravery, though he was not always recognized for his exploits. In the year 1635 he was bequeathed to the queen, Anne of Austria, and in one of her quarrels with Richelieu and her husband a wild scheme seems to have been formed, according to which Marcillac was to carry her off to Brussels on a pillion. These caballing against Richelieu, however, had no more serious results (an eight days’ experience of the Bastille excepted) than occasional exiles, that is to say, orders to retire to his father’s estates. After the death of the great minister (1642), opportunity seemed to be favourable to the vague ambition which then animated half the nobility of France. Marcillac became one of the so-called imporciours, and took an active part in reconciling the queen and Condé in a league against Gaston of Orleans. But the growing credit of Mazarin came in his way, and the hazard in which about this time (1643) he became entangled with the beautiful Duchess of Longueville made him irrevocably a Frondeur. He was a conspicuous figure in the siege of Paris, fought desperately in the desultory engagements which were constantly taking place, and was severely wounded at the siege of Mardyke. In the second Fronde Marcillac followed the fortunes of Condé, and the death of his father, which happened at the time (1650), gave rise to a characteristic incident. The nobility of the province gathered to the funeral, and the new duke de La Rochefoucauld took the opportunity of persuading them to follow him in an attempt on the royalist garrison of Saumur, which, however, was not successful. He has no space to follow La Rochefoucauld through the tortuous cavalier and negotiations of the later Fronde; it is sufficient to say that he was always brave and generally unlucky. His run of bad fortune reached its climax in the battle of the Faubourg Saint Antoine (1652), where he was shot through the head, and it was thought that he would lose the sight of both eyes. It was nearly a year before he recovered, and then he found himself at his country seat of Verteuil, with not result of twenty years’ fighting and intriguing except impaired health, a seriously embarrassed fortune, and some cause for bearing a grudge against almost every party and man of importance in the state. He spent some years in this retirement, and he was fortunate enough (thanks chiefly to the fidelity of Gourville, who had been in his service, and who, passing into the service of Mazarin and of Condé, had acquired both wealth and influence) to be able to repair in some measure the breaches in his fortune. He did not, however, return to court life much before Mazarin’s death, when Louis XIV. was on the eve of assuming absolute power, and the turbulent aristocratic anarchy of the Fronde was a thing utterly of the past.

Somewhat earlier, La Rochefoucauld had taken his place in the salon of Madame de Sablé, a member of the old Rambouillet coterie, and the founder of a kind of successor to it. It was known that he, like almost all his more prominent contemporaries, had spent his solitude in writing memoirs, while the special literary employment of the Sablé salon was the fabrication of *Sentences* and *Maxims*. In 1665, however, more trouble than reputation, and not a little of both, was given to him by a surreptitious publication of his memoirs, or what purported to be his memoirs, by the Elzevirs. Many of his old friends were deeply wounded, and he hastened to deny flatly the authenticity of the publication, a denial which (as it seems, without any reason) was not very generally accepted. Three years later (1665) he published, though without his name, the still more famous *Maxims*, which at once established him high among the men of letters of the time. About the same date began the friendship with Madame de la Fayette, which lasted till the end of his life. The glimpses which we have of him henceforward are chiefly derived from the letters of Madame de Sévigné, and, though they show him suffering agones from gout, are on the whole pleasant. He had a circle of devoted friends; he was recognized as a moralist and man of letters of the first rank; and the Fronde was the only one of his political experiences to which he could refer as contributing to any altered measure of the times his son, the prince de Marillac, to whom some time before his death he resigned his titles and honours, enjoyed a considerable position at court. Above all, La Rochefoucauld was generally recognized by his contemporaries from the king downward as a type of the older noblesse as it was before the sun of the great monarch dimmed its brilliant qualities. This position he has retained until the present day. He died at Paris on the 17th of March 1680, of the disease which had so long tormented him.

La Rochefoucauld’s character, if considered without the prejudice which a dislike to his ethical views has sometimes occasioned, is thoroughly respectable and even amiable. Like almost all his contemporaries, he saw in politics little more than a chessboard where the people at large were but pawns. The weight of testimony, however, inclines to the conclusion that he was unusually scrupulous in his conduct, and that his comparative ill-success in the struggle arose more from this scrupulousness than from anything else. He has been charged with irresolution, and there is some ground for admitting the charge so far as to pronounce him one of those the keenness of whose intellect, together with their apprehension of both sides of a question, interferes with their capacity as men of action. But there is no ground whatever for the view which represents the *Maxims* as the mere outcome of the spirit of a disappointed intriguers, disappointed through his own want of skill rather than of fortune.

His importance as a social and historical figure is, however, far inferior to his importance in literature. His work in this respect consists of three parts-letters, *Mémoires* and the *Maxims*. His letters exceed one hundred in number, and are biographically valuable, besides displaying not a few of his literary characteristics; but they need not further detain us. The *Mémoires*, when they are read in their proper form, yield in literary merit, in interest, and in value to no memoirs of the time, not even to those of Retz, between whom and La Rochefoucauld there was a strange mixture of enmity and esteem which resulted in a couple of most characteristic “portraits.” But their history is
unique in its strangeness. It has been said that a pirated edition appeared in Holland, and this, despite the author's protest, continued to be reprinted for some thirty years. It has been now proved to be a mere cento of the work of half a dozen different men, scarcely a third of which is La Rochefoucauld's, and which could only have been possible at a time when it was the habit of persons who frequented literary society to copy pell-mell in commonplace books the MS. compositions of their friends and others. Some years after La Rochefoucauld's death a new recession appeared, somewhat less incorrect than the former, but still largely adulterated, and this held its ground for more than a century. Only in 1817 did anything like a genuine edition (even then by no means perfect) appear. The Maxims, however, had no such fate. The author re-edited them frequently during his life, with alterations and additions; a few were added after his death, and it is usual now to print the whole of them, at whatever time they appeared, together. Thus taken, they amount to about three hundred little reflective maxims, in a couple of large folio volumes exceeding half a page in length, and more frequently confined to two or three lines. The view of conduct which they illustrate is usually and not quite incorrectly summed up in the words "everything is reducible to the motive of self-interest." But though not absolutely incorrect, the phrase is misleading. The Maxims are in no respect mere deductions from or applications of any such general theory. They are on the contrary independent judgments on different relations of life, different affections of the human mind, and so forth, from which, taken together, the general view may be deduced or rather composed. Sentimental moralists have protested loudly against this view, yet it is easier to declaim against it in general than to find a flaw in the several parts of which it is made up. With a few exceptions La Rochefoucauld's maxims represent the maturest result of the reflection of a man deeply versed in the business and pleasures of the world. As such, they will remain in his. The out of his workmanship is futil. The sentiment, far from being merely hard, as the sentimentalists pretend, has a vein of melancholy poetry running through it which calls to mind the traditions of La Rochefoucauld's devotion to the romances of chivalry. The maxims are never shallow; each is the text for a whole sermon of application and corollary which any one of thought and experience can write. Add to all this that the language in which they are written is French, still at almost its greatest strength, and chastened but as yet unemasculated by the reforming influence of the 17th century, and it is not necessary to say more. To the literary critic no less than to the man of the world La Rochefoucauld ranks among the scanty number of pocket-books to be read and re-read with ever new admiration, instruction and delight.

The editions of La Rochefoucauld's Maxims (the full title runs, Réflexions morales et maximes morales publiées dans sa vie, à l'occasion des dates 1605 (editio princeps), 1666, 1671, 1675, 1678. An important edition which appeared after his death in 1693 may rank almost with these. As long as the Memoirs remained in the state above possessed of an extraordinary fine and acute intellect, on the conduct and motives which have guided himself and his fellows. There is as little trace in them of personal spite as of forfanterie de vio. But the astonishing excellence of the literary medium in which they are conveyed is even more remarkable than the general soundness of their ethical import. In uniting the four qualities of brevity, clearness, fulness of meaning and point, La Rochefoucauld has no rival. His Maxims are never mere epigrams; they are never platitudes; they are never dark sayings. He has packed them so full of meaning that it would be impossible to pack them closer, yet there is no undue compression; he has sharpened their point to the utmost, yet there is no loss of substance. The comparison which occurs most frequently, and which is perhaps on the whole the justest, is that of a bronze medallion, and it applies to the matter no less than to the form. Nothing is left unfinished, yet none of the workmanship is futil. The sentiment, far from being merely hard, as the sentimentalists pretend, has a vein of melancholy poetry running through it which calls to mind the traditions of La Rochefoucauld's devotion to the romances of chivalry. The maxims are never shallow; each is the text for a whole sermon of application and corollary which any one of thought and experience can write. Add to all this that the language in which they are written is French, still at almost its greatest strength, and chastened but as yet unemasculated by the reforming influence of the 17th century, and it is not necessary to say more. To the literary critic no less than to the man of the world La Rochefoucauld ranks among the scanty number of pocket-books to be read and re-read with ever new admiration, instruction and delight.

The la ROCHEFOUCAULD-LIANCOURT—LA ROCHEJACQUELEIN 221 edition of the Maxims is the so-called Édition des bibliothèques (1870); but cheap and handy issues are plentiful. See the English version by G. H. Powell (1903). Nearly all the great French critics of the 19th century have dealt more or less with La Rochefoucauld; the first recent monograph is that of J. Bourdieu in the Grands écrivains français (1893).

LA ROCHEFOUCAULD-LIANCOURT, FRANÇOIS ALEXANDRE FRÉDÉRIC, DUC DE (1747-1827), French social reformer, was born at La Roche Guyon on the 11th of January 1747, the son of François Armand de La Rochefoucauld, duc d'Estissac, grand master of the royal wardrobe. The duc de Liancourt became an officer of carabiniers, and married at seventeen. A visit to England seems to have suggested the establishment of a model farm at Liancourt, where he reared cattle imported from England and Switzerland. He also set up spinning machines on his estate, and founded a school of arts and crafts for the sons of soldiers, which became in 1788 the École des Enfants de la Patrie under royal protection. Elected to the states-general of 1789 he sought in vain to support the cause of royalty while furthering the social reforms he had at heart. On the 12th of July, two days before the fall of the Bastille, he warned Louis XVI. of the state of affairs in Paris, and met his exclamation that there was a revolt with the answer, "Non, sire, c'est une révolution." On the 18th of July he became president of the Assembly. Established in command of a military division in Normandy, he offered Louis a refuge in Rouen, and, failing in this effort, assisted him with a large sum of money. After the events of the 16th of August 1792 he fled to England, where he was the guest of Arthur Young, and thence passed to America. After the assassination of his cousin, Louis-Alexandre, duc de La Rochefoucauld d'Enville, at Gisors on the 14th of September 1792 he assumed the title of duc de La Rochefoucauld. He returned to Paris in 1799, but received small favour from Napoleon. At the Restoration he entered the House of Peers, of which he was president, in 1812, and refused to restate him as aristocrat of the 1815. He was one of the first promoters of vaccination in France; he established a dispensary in Paris, and he was an active member of the central boards of administration for hospitals, prisons and agriculture. His opposition to the government in the House of Peers led to his removal in 1823 from the honorary positions he held, while the vaccination committee, of which he was president, was suppressed. The academies of science and of medicine admitted him to their membership by way of protest. "Official hostility pursued him even after his death (27th of March 1827), for the old pupils of his school were charged by the military at his funeral. His works, chiefly on economic questions, include books on the English system of taxation, poor-relief and education.

His eldest son, François, duc de La Rochefoucauld (1765-1848), succeeded his father in the House of Peers. The second, Alexandre, duc de La Rochefoucauld (1767-1841), married a San Domingo heiress. Allied to the Beauharnais family, La Rochefoucauld became dame d'honneur to the empress Josephine, and their eldest daughter married a brother-in-law of Pauline Bonaparte, Princess Borghese. La Rochefoucauld became ambassador successively to Vienna (1809) and to Madrid (1812-1814). He negotiated the union of Holland with France. During the "Hundred Days" he was made a peer of France. He subsequently devoted himself to philanthropic work, and in 1822 became deputy to the Chamber and sat with the constitutional royalists. He was again raised to the peerage in 1831.

The third son, Frédéric Gaétan, marquis de La Rochefoucauld-Liancourt (1779-1863), was a zealous philanthropist and a partisan of the constitution of 1812. He was chief of police of Paris in politics after 1848. The marquis wrote on social questions, notably on prison administration; he edited the works of La Rochefoucauld, and the memoirs of Condrozet; and he was the author of some vaudevilles, tragedies and farces.

LA ROCHEJACQUELEIN, DE, the name of an ancient French family of La Vendée, celebrated for its devotion to the throne during and after the Revolution. Its original name was Duverger, derived from a fief near Bressuire in Poitou, and its pedigree
LA ROCHELLE

is traceable to the 13th century. In 1050 Gui Duverger married Renée, heiress of Jacques Lemartin, seigneur de La Rochejacquelein, whose name he assumed. His grandson, Louis Duverger, seigneur de La Rochejacquelein, was a devoted adherent of Henry II, and was badly wounded at the battle of Arques; other members of the family were also distinguished soldiers, and the seigniory was raised to a countship and marquisate in reward for their services.

At the outbreak of the Revolution the chief of the family was Henri Louis Auguste, marquis de La Rochejacquelein, major of the royal army, who had three sons named after himself—Henri, Louis, and Auguste. The marquis fled abroad with his second son Louis at the time of the emigration of the nobles. He entered the service of Great Britain, and died in San Domingo in 1802.

Henri, comte de La Rochejacquelein, born at Dubertien, near Châtillon, sur Sèvres, on the 20th of August 1772, did not emigrate with his father. He served in the constitutional guard of the king, and remained in Paris till the execution of Louis XVI. He then took refuge with the marquis de Lescure on his own estates in Poitou. When the anti-clerical policy of the Revolutionary powers provoked the rising of the peasantry of La Vendée, he put himself at the head of the men of his neighbourhood, and came rapidly to the front among the gentlemen whom the peasants took for leaders. In spite of his youth and his reluctance to assume the responsibility, he was chosen as commander-in-chief after the defeat of the Vendéans by the republicans at Cholet. His brilliant personal courage, his amiability and his loyalty to the cause made him a very attractive figure, but a commander-in-chief of the Vendéans, who came and went as they pleased, had little real power or opportunity to display the qualities of a general. The comte de La Rochejacquelein had in fact to obey his army, and could only display his personal valour in action. He could not avert the mistaken policy which led to the rout at Le Mans, and was finally shot in an obscure skirmish at Nouaillé on the 4th of March 1794.

Louis, marquis de La Rochejacquelein, the younger brother of Henri, accompanied his father in the emigration, served in the army of Condé, and entered the service of England in America. He returned to France during the Consulate, and in 1801 married the marquise de Lescure, widow of his brother's friend, who was mortally wounded at Cholet. Marie Louise Victoire de Donnissan, born at Versailles on the 25th of October 1772, belonged to a court family and was the god-daughter of Mme Victoire, daughter of Louis XV. At the age of seventeen she married the marquis de Lescure, whom she accompanied in the war of La Vendée. After his death she went through various adventures recorded in her memoirs, first published at Bordeaux in 1815. They are of extreme interest, and give a remarkable picture of the war and the fortunes of the royalists. She saved much of her own property and her first husband's, when a conciliatory policy was adopted after the fall of the Terrorists. After her second marriage she lived with her husband on her estates, both refusing all offers to take service with Napoleon. In 1814 they took an active part in the royalist movement in and about Bordeaux. In 1815 the marquis endeavoured to bring about another Vendéan rising for the king, and was shot in a skirmish with the Imperialist forces at the Pont des Marches on the 4th of June 1815. The marquis died at Orleans in 1857.

Their eldest son, Henri Auguste Georges, marquis de La Rochejacquelein, born at Château Citran in the Gironde on the 17th of September 1825, was educated as a soldier in Spain in 1828 and as a volunteer in the Russo-Turkish War of 1828. During the reign of Louis Philippe he adhered to the legitimist policy of his family, but he became reconciled to the government of Napoleon III, and was mainly known as a clerical orator and philanthropist. He died on the 7th of January 1867.

His son and successor, Julien Marie Gaston, born at Chartres on the 27th of March 1833, was an active legitimist deputy in the Assembly chosen at the close of the German War of 1870-1871. He was a strong opponent of Thiers, and continued to contest constituencies as a legitimist with varying fortunes till his death in 1897.

Authorities—Henri de La Rochejacquelein et la guerre de la Vendée d'après des documents inédits (Niort, 1890); A. F. Nettetem, Vie de Mme la Marquise de La Rochejacquelein (Paris, 1896). The Annales of the marquis were translated into English by Sir Walter Scott, and issued as a volume of " Constable's Miscellany " (Edinburgh, 1827).

LA ROCHELLE, a seaport of western France, capital of the department of Charente-Inferieure, 90 m. S. E. by N. of Nantes on the railway to Bordeaux. Pop. (1906) town, 24,524, commune, 33,858. La Rochelle is situated on the Atlantic coast on an inlet opening off the great bay in which lie the islands of Ré and Oléron. Its fortifications, constructed by Vauban, have a circuit of 3½ m. with seven gates. Towards the sea are three towers, of which the oldest (1734) is that of St Nicholas. The apartment in the first storey was formerly used as a chapel. The Château, built towards the end of the 14th century, is so called from the chain which guarded the harbour at this point; the entrance to the tidal basin was at one time spanned by a great pointed arch between the two towers. The lantern tower (1445-1476), seven storeys high, is surmounted by a lofty spire and was once used as a lighthouse. Of the ancient gateways only one has been preserved in its entirety, that of the " Grosse Horloge," a huge square tower of the 14th or 15th century, the corner turrets of which have been surmounted with trophies since 1746. The cathedral of La Rochelle (St Louis or St Bartholomew) is a heavy Grecian building (1742-1762) with a dome above the transept, erected on the site of the old church of St Bartholomew, destroyed in the 16th century and now represented by a solitary tower dating from the 14th century. Externally the town-house is in the Gothic style of the latter years of the 15th century and has the appearance of a fortress, though its severity is much relieved by the beautiful carving of the two entrances, of the machicolations and of the two bellfries. The buildings looking into the inner court are in the Renaissance style (16th and early 17th centuries) and contain several fine apartments. In the old episcopal palace (which was in turn the residence of Sully, the prince of Condé, Louis XIII., and Anne of Austria, and the scene of the marriage of Alphonso VI. of Portugal with a princess of Savoy) accommodation has been provided for a library, a collection of records and a museum of art, and antiquities. Other buildings of note are an arsenal with an artillery museum, a large hospital, a special Protestant hospital, a military hospital and a lunatic asylum for the department. In the botanical gardens there are museums of natural history. Medieval and Renaissance houses give a peculiar character to certain districts; several have French, Latin or Greek inscriptions of a moral or religious turn and in general of Protestant origin. Of these old houses the most interesting is one built in the middle of the 16th century and wrongly known as that of Henry II. The parade-ground, which forms the principal public square, occupies the site of the castle demolished in 1590. Some of the streets have side-arcades; the public wells are fed from a large reservoir in the Champ de Mars; and among the promenades are the Cours des Dames with the statue of Admiral Duperré, and outside the Charruyer Park on the west front of the ramparts, and the Mail, a beautiful piece of greensward. In this direction are the sea-bathing establishments.

La Rochelle is the seat of a bishofric and a prefect, and has tribunals of first instance and of commerce, a chamber of commerce, a hospital, and a grammar school belonging to the Bank of France; its educational establishments include an ecclesiastical seminary, a lyceum and a training college for girls. Ship-building, saw-milling and the manufacture of briquettes and chemicals, sardine and tunny-preserving and petroleum-refining are among the industries. The rearing of oysters and mussels and the exploitation of salt marshes is carried on in the vicinity.

The inlet of La Rochelle is protected by a stone mole constructed by Richelieu and visible at low tide. The harbour, one of the safest on the coast, is entered by a channel 2730 yds. long,
and comprises an outer harbour opening on the one hand into a floating basin, on the other into a tidal basin with another floating basin adjoining it. Behind the tidal basin is the Maubec reservoir, the waters of which, along with those of the Marans canal, help to scour the port and navigable channel. Some 200 sailing ships are engaged in the fisheries, and the fish market of La Rochelle is the most important on the west coast. The harbour is, however, inaccessible to the largest vessels, for the accommodation of which the port of La Pallice, inaugurated in 1891, was created. Lying about 3 m. W.S.W. of La Rochelle, this port opens into the bay opposite the eastern extremity of the island of Ré. It was artificially excavated and affords safe anchorage in all weathers. The outer port, protected by two jetties, has an area of 29 acres and a depth of 165 ft. below lowest tide-level. At the extremity of the breakwater is a wharf where ships may discharge without entering the basin. A lock connects with the interior of the basin of 27 acres, having a quayage, a minimum depth of 28 ft., and depths of 29½ ft. and 36 ft. at high, neap and spring tides. Connected with the basin are two graving docks. La Pallice has regular communication with South America by the vessels of the Pacific Steam Navigation Company and by those of other companies with London, America, West Africa, Egypt and the Far East. The port has petroleum refineries and chemical manure works.

In 1906 there entered the port of La Rochelle, including the dock of La Pallice, 441 vessels with a tonnage of 629,038, and cleared 468 vessels with a tonnage of 684,861 (of which 235 of 241,146 tons cleared with ballast). These figures do not include vessels entering from, or clearing for, other ports in France. The imports (value, £1,176,000 in 1909 as compared with £1,758,000 in 1907) include coal and patent fuel, superphosphates, natural phosphates, nitrate of soda, pyrites, building-timber, wines and alcohol, pitch, dried codfish, and pyrites, jute, wool, pulp. Exports (value, £1,304,000 in 1909; £1,670,000 in 1907) include wine and brandy, fancy goods, woolen goods, garments, skins, coal and briquettes, furniture, potatoes.

La Rochelle existed at the close of the 10th century under the name of Rupella. It belonged to the barony of Châtelaillon, which was annexed by the dukes of Aquitaine and succeeded Châtelaillon as chief town in Aquitaine. In 1199 it received a communal charter from Eleanor, duchess of Guienne, and it was in its harbour that John Lackland decided on the marriage of his son the Prince of Wales with Maud, daughter of Philip Augustus. Captured by Louis VIII in 1224, it was restored to the English in 1360 by the treaty of Brétigny, but it shot off the yoke of the foreigner when Du Guesclin recovered Saintes in 1379, and the English were expelled altogether on the 1st of October, 1588, after the discovery of the new world. The salt-taxe provoked a rebellion at Rochelle which Francis I. repressed in person in 1568; the town secured exemption by the payment of a large sum. At the Reformation La Rochelle early became one of the chief centres of Calvinism, and during the religious wars the armed privateers which preyed on Catholic vessels in the Channel and on the high seas. In 1571 a synod of the Protestant churches of France was held within its walls under the presidency of Beza for the purpose of continuing the ordinances of the church. After the defeat of St. Bartholomew, La Rochelle held out for six and a half months against the forces of Charles of the Catholic party, granted the Calvinists full liberty of worship in several places of safety. Under Henry IV. the town remained quiet, but under Louis XIII., it put itself again at the head of the Huguenot party. Its vessels blockaded the mouth of the Gironde and stopped the commerce of Bordeaux, and also seized the islands of Ré and Oéron and several vessels of the royal fleet. Richelieu then resolved to subdue the town once for all. In spite of the assistance rendered by the English and French armies and the fierce energy of their mayor Guilon, the people of La Rochelle were obliged to capitulate after a year's siege (October 1628). During this investment Richelieu raised the celebrated mole which now forms the eastern extremity of the new city, and which, with the exception of the principal port for the trade between France and the colony of Canada. But the revocation of the Edict of Nantes (1685) deprived it of some thousands of its most industrious inhabitants, and the loss of Canada by France completely withered the privateers, however, maintained a vigorous struggle with the English during the republic and the empire.

See P. Suzanne, La Rochelle pittoresque (La Rochelle, 1903), and E. Courau, La Rochelle disparue (La Rochelle, 1904).

LA ROCHE-SUR-YON—LARRA

LA ROCHE-SUR-YON, a town of western France, capital of the department of Vendéen, on an eminence on the right bank of the Yon, 48 m. S. of Nantes on the railway to Bordeaux. Pop. (1906) town 10,666, commune 13,685. The castle of La Roche, which probably existed before the time of the crusades, and was frequently attacked or taken in the Hundred Years' War and in the wars of religion, was finally dismantled under Louis XIII. When Napoleon in 1804 made this place, then of no importance, the chief town of a department, the stones from its ruins were employed in the erection of the administrative buildings, which, being all produced at once after a regular plan, have a monotonous effect. The equestrian statue of Napoleon I. in an immense square overlooking the rest of the town; the statue of General Trévot, who was engaged in the "pacification" of La Vendée; the museum, with several paintings by P. Baudry, a native artist, of whom there is a statue in the town, are the only objects of interest. Napoleon-Vendée and Bourbon-Vendée, the names borne by the town according to the dominance of either dynasty, gave place to the original name after the revolution of 1789.

The town is the seat of a prefect and a court of assizes, and has a tribunal of first instance, a chamber of commerce, a branch of the Bank of France, a lycée for boys and training colleges for both sexes. It is a market for farm-produce, horses and cattle, and has flour-mills. The dog fairs of La Roche are well known.

LAROMIGUÈRE, PIERRE (1756–1837), French philosopher, was born at Livignac on the 3rd of November 1756, and died on the 12th of August 1837 in Paris. As professor of philosophy at Toulouse he was unsuccessful and incurred the censure of the parliament by a thesis on the rights of property in connexion with taxation. Subsequently he came to Paris, where he was appointed professor of logic in the École Normale and lectured in the Prétanuc. In 1790 he was made a member of the Tribunate, and in 1833 of the Academy of Moral and Political Science. In 1793 he published Projet d’éléments de metaphysique, a work characterized by lucidity and excellence of style. He wrote also two Mémoires, read before the Institute, Les Paradexes de Condillac (1805) and Leçons de philosophie (1815–1818).

Laromiguère's philosophy is interesting as a revolt against the extreme physiological psychology of the natural scientists, such as Cabanis. He distinguished between those psychological phenomena which can be traced directly to purely physical causes, and those of the viva mentis which originate from within the soul. Psychology was not for him a branch of physiology, nor on the other hand did he give to his theory an abstruse metaphysical basis. A pupil of Condillac and indebted for much of his ideology to Destutt de Tracy, he attached a fuller importance to Attention as a psychic faculty. Attention provides the facts, Comparison groups and combines them, while Reason systematizes and explains. The soul is active in its choice, i.e. is endowed with free-will, and is, therefore, immortal. For natural science as a method of discovery he had no respect. He held that its judgments are, at the best, statements of f identity, and that its so-called discoveries are merely the reiteration, in a new form, of previous truisms. Laromiguère was not the first to develop these views; he owed much to Condillac, Destutt de Tracy and Cabanis. But, owing to the accuracy of his language and the purity of his style, his works had great influence, especially over Armand Marrast, Cardaillac and Cousin. A lecture of his in the École Normale impressed Cousin so strongly that he at once devoted himself to the study of philosophy. Jouffroy and Taine agree in describing him as one of the great thinkers of the 19th century.

Taine, Les Philosophes classiques du XIXe siècle; Gatien Armoult, Étude sur Laromiguère; Compayré, Notice sur Laromiguère; Ferrau, Spiritualisme et Liberalisme; F. Picard, Les Idéologues.

LARRA, MARIANO JOSÉ DE (1800–1837), Spanish satirist, was born at Madrid in 1800. His father served as a regimental doctor in the French army, and was compelled to leave the
LARSA—LARVAL FORMS

Peninsula with his family in 1812. In 1817 Larra returned to Spain, knowing less Spanish than French. His nature was disorderly, his education was imperfect, and, after futile attempts to obtain a degree in medicine or law, he made an imprudent marriage at the age of twenty, broke with his relatives and became a journalist. On the 27th of April 1834 he produced his first play, *No más mostrador*, based on two pieces by Scribe and Dieulafoy. Though wanting in originality, it is brilliantly written, and held the stage for many years. On the 24th of September 1834 he produced *Macías*, a play based on his own historical novel, *El Doncel de Don Enrique el Doliente* (1834). The drama and novel are interesting as experiments, but Larra was essentially a journalist, and the increased liberty of the press after the death of Ferdinand VII gave his caustic talent an ampler field. He was already famous under the pseudonyms of "Juan Pérez de Munguía" and "Figaro" which he used in *El Pobrecito Hablador* and *La Revista Española* respectively. Madrid laughed at his grim humour; ministers feared his vitriolic pen and courted him assiduously; he was elected as deputy for Ávila, and a great career seemed to lie before him. But the era of military pronunciamientos ruined his personal prospects and patriotic plans. His writing took on a more sombre tinge; domestic troubles increased his pessimism, and, in consequence of his disastrous love-affair, he committed suicide on the 13th of February 1837, leaving behind himself the greatest prose-writer that Spain can boast during the 19th century. He wrote at great speed with the constant fear of the censor before his eyes, but no sign of haste is discernible in his work, and the dexterity with which he aims his venomous shafts is amazing. His political instinct, his abundance of ideas and his forcible, mordant style would have given him a foremost position at any time and in any country; in Spain, and in his own period, they placed him beyond all rivalry. (J. F.-K.)

**LARSA** (Biblical *Ellasar*, Gen. xiv. 1), an important city of ancient Babylonia, the site of the worship of the sun-god, Shamash, represented by the ancient ruin mound of Senkerah (Senkera). It lay 15 m. S.E. of the ruin mounds of Warka (anc. Erech), near the east bank of the Shatt-en-Nil canal. Larra is mentioned in Babylonian inscriptions as early as the time of Ur-Gur, 2700 or 2800 B.C., who built or restored the *ziggurat* (stage-tower) of E-Babbar, the temple of Shamash. Politically it came into special prominence at the time of the Elamite conquest, when it was made the centre of Elamite dominion in Babylonia; perhaps a special check upon the growth of Erech which had played a prominent role in the resistance to the Elamites. At the time of Khammurabi's successful struggle with the Elamite conquerors it was ruled by an Elamite king named Eriaku, the Arioche of the Bible, called Rim-Sin by his Semitic subjects. It finally lost its independence under Samsu-iluna, son of Khammurabi, c. 1900 B.C., and from that time until the close of the Babylonian period it was a subject city of Babylon. Loftus conducted excavations at this site in 1854. He describes the ruins as consisting of a low, circular platform, about 4½ m. in circumference, rising gradually from the level of the plain to a central mound 70 ft. high. This represents the ancient *ziggurat* of the temple of Shamash, which was in part explored by Loftus. From the inscriptions found there it appears that, besides the kings already mentioned, Khammurabi, Burna-buriash (burusyas) and the great Nebuchadrezzar restored or rebuilt the temple of Shamash. The excavations at Senkerah were peculiarly successful in the discovery of inscribed remains, consisting of clay tablets, chiefly contracts, but including also an important mathematical abacus, a number of tablets of a description almost peculiar to Senkerah exhibiting in his relief scenes of daily life. Loftus found also the remains of an ancient Babylonian cemetery. From the ruins it would appear that Senkerah ceased to be inhabited at or soon after the Persian conquest.

See W. K. Loftus, *Chaldaea and Susiana* (1857). (J. P. Pf.)

**LARTET, EDUARD** (1801–1871), French archaeologist, was born in 1801 near Castelnau-Barbarenos, department of Gers, France, where his family had lived for more than five hundred years. He was educated for the law at Auch and Toulouse, but having private means elected to devote himself to science. The then recent work of Cuvier on fossil mammalia encouraged Lartet in excavations which led in 1834 to his first discovery of fossil remains in the neighbourhood of Auch. Thenceforward he devoted his whole time to a systematic examination of the French caves, his first publication on the subject being *The Antiquity of Man in Western Europe* (1860), followed in 1861 by *New Researches on the Coexistence of Man and of the Great Fossil Mammites characteristic of the Last Geological Period.* In this paper he made public the results of his discoveries in the cave of Aurignac, where evidence existed of the contemporaneous existence of man and extinct mammals.

In his work in the Périgord district Lartet had the aid of Henry Christy (q.v.). The first account of their joint researches appeared in a paper descriptive of the Dordogne caves and contents, published in *Revue archéologique* (1864). The important discoveries in the Madeleine cave and elsewhere were published by Lartet and Christy under the title *Reiugiae Aquitanicae*, the first part appearing in 1865. Christy died before the completion of the work, but Lartet continued it until his breakdown in health in 1870. The most modest and out of the most illustrious of the modern zoologists, his work had previously been publicly recognized by his nomination as an officer of the Legion of Honour; and in 1848 he had had the offer of a political post. In 1857 he had been elected a foreign member of the Geological Society of London, and a few weeks before his death he had been made professor of palaeontology at the museum of the Jardin des Plantes. He died at Seissan in January 1871.

**LARVAL FORMS**, in biology. As is explained in the article on Embryology (q.v.), development and life are coextensive, and it is impossible to point to any period in the life of an organism when the developmental changes cease. Nevertheless it is customary to speak of development as though it were confined to the early period of life, during which the important changes occur by which the uninculcated zygote acquires the form characteristic of the species. Using the word in this restricted sense, it is pointed out in the same article that the developmental period frequently presents two phases, the embryonic and the larval. During the embryonic phase the development occurs under protection, either within the egg or in the womb of the mother; and the larval phase is the actual growth of the organism. The term larval is applied to the organism in the larval phase.

At the end of this phase the young organism becomes free and uses, as a rule, its own mouth and digestive organs. If this happens before it has approximately acquired the adult form, it is called a larva (Lat. *larva*, ghost, spectre, mask), and the subsequent development by which the adult form is acquired constitutes the larval phase. In such forms the life-cycle is divided into three phases, the embryonic, the larval and the adult. The transition between the first two of these is always abrupt; whereas the second and third, except in cases in which a metamorphosis occurs (see Metamorphosis), graduate into one another, and it is not possible to say when the larval stage ends and the adult begins. This is only what would be expected when it is remembered that the developmental changes never cease. It might be held that the presence of functional reproductive organs, or the possibility of rapidly acquiring them, marks off the adult phase of life from the larval. But this test sometimes fails. In certain of the Ctenophora there is a double sexual life; the larva becomes sexually mature and lays eggs, which are fertilized and develop; it then loses its generative organs and metamorphoses into a larva which again develops reproductive organs (disgenesis; see Chun, *Die Ctenophoren des Golfes von Neapel*, 1880). In certain Amphibia the larva may develop sexual organs and breed (axolotl), but in this case (neoteny) it is doubtful whether further development may occur in the larva. A very similar phenomenon is found in certain insect larvae (Cecidomyia), but in this case ova alone are produced and develop pathogenically (paedogenesis). Again in certain Trematoda larval stages known as the sporocyst.
and redia produce ova which have the power of developing unfertilized; in this case the larva probably has not the power of continuing its development. It is very generally held by philosophers that the end of life is reproduction, and there is much to be said for this view; but, granting its truth, it is difficult to see why the capacity for reproduction should so generally be confined to the later stages of life. We know by more than one instance that it is possible for the larva to reproduce by sexual generation; why should not the phenomenon be more common? It is impossible in the present state of our knowledge to answer this question.

The conclusion, then, that we reach is that the larval phase of life graduates into the later phases, and that it is impossible to characterize it with precision, as we can the embryonic phase. Nevertheless great importance has been attached, in certain cases, to the forms assumed by the young organism when it breaks loose from its embryonic bonds. It has been widely held that the study of larvae is of greater importance in determining genetic affinity than the study of adults. What justification is there for this view? The phase of life, chosen for the ordinary anatomical and physiological studies and labelled as the adult phase, is merely one of the large number of stages of structure through which the organism passes during its free life. In animals with a well-marked larval phase, by far the greater number of the stages of structure are included in the larval period, for the developmental changes are more numerous and take place with greater rapidity at the beginning of life than in its later periods. As each of the larval stages is equal in value for the purposes of our study to the adult phase, it clearly follows that, if there is anything in the view that the anatomical study of organisms is of importance in determining their mutual relations, the study of the organism in its various larval stages must have a greater importance than the study of the single and arbitrarily selected stage of life—such as the adult.

The importance, then, of the study of larval forms is admitted, but before proceeding to it this question may be asked: What is the meaning of the larval phase? Obviously this is part of a larger problem: Why does an organism, as soon as it is established at the fertilization of the ovum, enter upon a cycle of transformations which never cease until death puts an end to them? It is impossible to give any other answer to this question than this, viz. that it is a property of living matter to react in a remarkable way to external forces without undergoing destruction. As is explained in embryology, development consists of an orderly interaction between the organism and its environment. The action of the environment produces certain morphological changes in the organism. These changes enable the organism to move into a new environment, which in its turn produces further structural changes in the organism. These in their turn enable, indeed necessitate, the organism to move again into a new environment, and so the process continues until the end of the life-cycle. The essential condition of success in this process is that the organism should always shift into the environment to which its new structure is suited, any failure in this leading to impairment of the organism. In most cases the shifting of the environment is a very gradual process, and the morphological changes in connexion with each step of it are slight. In some cases, however, jumps are made, and whenever such jumps occur we get the morphological phenomenon termed metamorphosis. It would be foreign to our purpose to consider this question further here, but before leaving it we may suggest, if we cannot answer, one further question. Has the duration and complexity of the life-cycle expanded or contracted since organisms first appeared on the earth? According to the current view, the life-cycle is continually being shortened on one hand by the abbreviation of embryonic development and by the absorption of larval stages into the embryonic period, and lengthened at the other by the evolutionary creation of new adult phases. What was the condition of the earliest organisms? Had they the property of reacting to external forces to the same extent and in the same orderly manner that organisms have to-day?
LARVAL FORMS

The first, in its most primitive form, a small transparent creature, with a mouth and anus and a postoral longitudinal ciliated band (fig.
5, A). In Asteroids the band of cilia becomes divided in such a way as to give rise to two bands, the one preoral, encircling the preoral lobe, and the other remaining postoral (fig. 5, B). In the other groups the band remains single and longitudinal. In all cases the edges of the body carrying the ciliary bands become sinuous (fig 6) and sometimes prolonged into arms (figs. 7-9), and each of the four groups has its own type of larva. In Asteroids, in which the band divides, the larva is known as the bipinnaria (fig. 7); in Holothurians it is called the auricularia (fig. 6); in Echinoids and Ophiurids, in which the arms are well marked, it is known as the pluteus (fig. 9) and ophiopluteus (fig. 8) respectively.

All these forms were obviously distinct but as obviously modifications of a common type and related to one another. They present certain remarkable structural features which differentiate them from other larval types except the tornaria larvae of the Enteropneusta. They possess an alimentary canal with a mouth and anus as does the echinoid trochosphere, but they differ altogether from that larva in having a diverticulum of the alimentary canal which gives rise to the coelom and to a considerable part of the meso-
blast. Further, they are without an apical plate with its tuft of sensory hairs.

In Crinoids the types are different (fig. 10), and might belong to a different phylum. The body is opaque and encased in a type of ciliated band, and is without either mouth, anus or arms, and there is a tuft of cilia on the preoral lobe. A resemblance to the other Echinoderm larvae is found in the fact that coelomic diverticula of the enteron are present.

The larvae of two other groups present certain resemblances to the typical Echino-
derm larvae. The one of these is the tornaria larva of the Enteropneusta (fig. 11), which recalls Echino
derm larvae in the possession of ciliary bands, the one preoral and the other postoral and partly longitudinal, and in the presence of gut diver
ticula which give rise to the coelom; but, like the echinoderms, it possesses an apical plate with sensory organs on the preoral lobe. The resemblance of the tornaria to the bipinnaria is so close that, taking into consideration certain additional resemblances in the arrangement

trochosphere type just described. A larva similar to the trochosphere in some features, particularly in possessing a preoral ring of cilia and an apical plate, is found in the Polyzoa, and in adult Rotifers, which latter, in their ciliary ring and excretory organs, present some resemblance to the trochosphere, and are sometimes described as permanent adult trochospheres. But in these phases the resemblance to the

typical forms is not nearly so close as it is in the case of the larva of Annelida and Mollusca.

In the Echinodermata there are two distinct larval forms which cannot be brought into relation with one another. The one of these is found in the Asteroids, Ophiurids, Echinoids and Holothuroids; the other in the Crinoids.

From Haeckel's Comparative Embryology, by permissio ed Magister in.
of the coelomic vesicles which arise from the original gut diverticulum, it is impossible to resist the conclusion that there is affinity between the Echinoderm and Enteropneust phyla. Here we have a case like that of the Tunicata in which an affinity which is not presented by the adult, viz. the presence of a strong cuticle and of articulated appendages and the absence of cilia. They are remarkable among larvae for the number of stages which they pass through in attaining the adult state. However, numerous these may be, they almost always have, when first set free from the egg, one of two forms, that of the nauplius (fig. 13, A) or that of the zoaea (fig. 13, B). The nauplius is found throughout the group and is the more important of the two; the zoaea is confined to the higher members, in some of which it merely forms a stage through which the larva, hatched as a nauplius, passes in its gradual development. The nauplius larva is of classic interest because its occurrence has enabled zoologists to determine with precision the position in the animal kingdom of a group, the Cirripedia, which was placed by the illustrious Cuvier among the Mollusca.

In the Tunicata the nauplius larvæ of all animals, the Alimentary gut. The larva is the larval form of the adult. It is therefore of interest to determine the position of the nauplius larva of the Enteropneust, that of the pod and of the tunicaria larva of the Enteropneustae, in that it pointed the way to the recognition of the affinities of the Tunicata, affinities which were entirely unsuspected till they were revealed by a study of the larvae.

With regard to the occurrence of larvae, three general statements may be made. (1) They are always associated with a small egg in which the amount of food yolk is not sufficient to enable the animal to complete its development in the embryonic state. (2) A free-swimming larva is generally found in cases in which the adult is attached to foreign objects. (3) A larval stage is, as a rule, associated with internal parasitism of the adult. The object gained by the occurrence of a larva in the two last cases is to enable the species to distribute itself over as wide an area as possible. It may further be asserted that land and fresh-water animals develop without a larval stage much more frequently than marine forms. This is probably partly due to the fact that the conditions of land and fresh-water life are not so favourable for the spread of a species over a wide area by means of simply-organized larvae as are those of marine life, and partly to the fact that, in the case of fresh-water forms at any rate, a feebly-swimming larva would be in danger of being swept out to sea by currents.

1. The association of larvae with small eggs. This is a true state-}

1. The association of larvae with small eggs. This is a true state-
LARYNGITIS—

In the majority of cases, however, in which there is a small amount of food yolk and no special arrangements for the larval changes, the larval stages are passed. The Mollusca can be taken to illustrate this point, for in them we find every kind of development from the completely embryonic development of the Cephalopoda, with their large heavily-yolked eggs, to the development of the Tunicata, gastropod, or molluscan stage, in which the embryonic period is short and there is a long larval development. The Mollusca are further specially interesting for showing very clearly cases in which, though the young are born or hatched fully developed, the larval stages are passed through in the egg, and the larval organs (e. g. velum) are developed but without function (e. g., Paludina, Cyclas, Onchidiurn). As already mentioned, the larval form of the Mollusca is the trochospherid.

1. Internal parasites generally have a stage which may be called larval, in which they are transferred either by active or passive migration to a new host. In most Nematomata (Trichina) there is a larva which leads a free life; but in some nematomata (Tribina) and some cestodes the larva does not become free.

LARYNGITIS, an inflammation of the mucus of the larynx.

There are three chief varieties: acute, chronic, and oedematous.

Acute Laryngitis may be produced by an independent catarrah, or by one extending either from the nasal or the bronchial mucous membrane into that of the larynx. The causes are various, "catching cold" being the most common. Excessive use of the voice either in speaking or singing sometimes gives rise to it. The inhalation of irritating particles, vapours, &c., and swallowing very hot fluids or corrosive poisons are well-recognized causes. It may also occur in connexion with diseases, notably measles and influenza. As a result of the inflammation there is a general swelling of the parts about the larynx and the epiglottis, the result being a narrowing of the channel for the entrance of the air, and to this the chief dangers are due. The symptoms vary with the intensity of the attack; there is first a sense of tickling, then of heat, dryness, and pain in the throat, with some difficulty in swallowing. There is a dry cough, with expectation of phlegm; the pharynx becomes painful, while the voice is husky, and may be completely lost. In children there is some dyspnoea. In favourable cases, which form the majority, the attack tends to subside in a few days, but the inflammation may become of the oedematous variety, and death may occur suddenly from an asphyxial paroxysm. Many cases of acute laryngitis are so slight as to make themselves known only by hoarseness and the character of the cough, nevertheless in every instance the attack demands serious attention. The diagnosis is, in adults, a matter of much difficulty, especially if an examination is made with the laryngoscope; in children, however, it is more difficult, and the question of diphtheria must not be lost sight of. The treatment is, first and foremost, rest; no talking must be allowed. The patient should be kept in bed, in a room at an even temperature, and the air saturated with moisture. An ice pack, applied to the throat, gives much relief, whilst internally diaphoretics may be given, and a full dose of Dover's powder if there be much pain or cough.

Chronic Laryngitis usually occurs as a result of repeated attacks of the acute form. It is extremely common in people who habitually over-use the voice, and is the cause of the hoarse voice one associates with street sellers. The constant inhalation of irritating vapours, such as tobacco smoke, may also cause it. There is usually little or no pain, only the unpleasant sensation of tickling in the larynx, with a constant desire to cough. The changes in the mucous membrane are more permanent than in the acute variety, and there nearly always accompanies this a chronic alteration of the membrane of the pharynx (granular pharyngitis). The treatment consists in stopping the cause, where known, e.g., the smoking or singing. Careful examination should be made to see if there is any nasal obstruction, and the larynx should be treated locally with suitable astringents, by means of a brush, spray or insufflation. Overheated and ill-ventilated rooms must be avoided, as entrance into them immediately aggravates the trouble and causes a paroxysm of coughing.

Oedematous Laryngitis is a very fatal condition, which may occur, though rarely, as a sequel of acute laryngitis. It is rarely seen in syphilitic and tubercular conditions of the larynx, in kidney disease, in certain fevers, and in cases of cellulitis of the neck. The larynx is also one of the sites of Angeioneuritic oedema. In this form of laryngitis there are all the symptoms of acute laryngitis, but on a very much exaggerated scale. The dyspnoea, accompanied by marked stridor, may arise and reach a dangerous condition within the space of an hour, and demand the most prompt treatment. On examination the mucous membrane round the epiglottis is seen to be enormously swollen. The treatment is ice round the throat and internally, scarification of the swollen parts, and should that not relieve the asphyxial symptoms, tracheotomy must be performed immediately.

Tubercular Laryngitis is practically always associated with phthisis. The mucous membrane is invaded by the tubercles, which first form small masses. These later break down and ulcerate; the ulceration then spreads up and down, causing an inflammation of it, which may extend to the bronchi, the throat, the epiglottis, and the trachea. The first indication of the disease is a hoarseness, or, in certain forms, pain on swallowing. The cough is, as a rule, a late symptom. A sudden oedema may bring about a rapid fatal termination. The general treatment is the same as that advised for phthisis; locally, the affected parts may be removed by one or a series of operations, generally under local anaesthesia, or they may be treated with some destructive agent such as lactic acid. The pain on swallowing can be best alleviated by painting with a weak solution of cocaine.

The condition is a very grave one; the prognosis depends largely on the associated pulmonary infection—if that is extensive, a very small amount of laryngeal mischief resists treatment, while, if the case be the contrary, a very extensive mischief may be successfully dealt with.

Syphilitic Laryngitis.—Invasion of the larynx in syphilis is very common. It may occur in both stages of the disease and in the inherited form. In the secondary stage the damage is superficial, and the symptoms those of a slight acute laryngitis. The injury in the tertiary stage is much more serious, the deeper structures are invaded with the formation of deep ulcers, which may when they heal form strong cicatrices, which produce a narrowing of the air-passage which may eventually require surgical interference. Occasionally a fatal oedema may arise. The treatment consists of administering constitutional remedies, local treatment being of comparatively slight importance.

Paroxysmal Laryngitis, or Laryngismus stridulus, is a nervous affection of the larynx that occurs in infants. It appears to be associated with adenoids. The disease consists of a reflex spasm of the glottis, which causes a complete blocking of the air-passage. The attacks, which are recurrent, cause acute asphyxia. They may cease for no obvious reason, or one may prove fatal. The whole attack is of such short duration that the child may either recovered or succumbed before assistance can be called. After an attack, careful examination should be made, and the adenoids, if present, removed by operation.

LA SABLIERE, MARGUERITE DE (c. 1640–1693), friend and patron of La Fontaine, was the wife of Antoine Rambouillet, sieur de la Sablére (1624–1679), a Protestant financier entrusted with the administration of the royal estates, her maiden name being Marguerite Hessein. She received an excellent education in Latin, mathematics, physics, and anatomy from the best scholars of her time, and her house became a meeting-place for poets, scientists and men of letters, no less than for brilliant members of the court of Louis XIV. About 1673 Mme de la Sablére received into her house La Fontaine, whom for twenty years she relieved of every kind of material anxiety. Another friend and inmate of the house was the traveller and physician François Bernier, whose abridgment of the works of Gassendi and the abbé Chauveau and...
his fellow-poet, Charles Auguste, marquis de La Fare, were among his most intimate associates. La Fare sold his commission in the army to be able to spend his time with her. This liaison, which seems to have been the only serious passion of her life, was broken in 1679. La Fare was seduced from his allegiance, according to Mme de Sévigné by his love of play, but to this must be added a new passion for the actress La Champmeslé. Mme de la Sablière thenceforward gave more and more attention to good works, much of her time being spent in the hospital for incurables. Her husband’s death in the same year increased her serious tendencies, and she was presently converted to Roman Catholicism. She died in Paris on the 8th of January 1693.

LA SALE (or LA SALLE), ANTOINE DE (c. 1388–1462?), French writer, was born in Provence, probably at Arles. He was a natural son of Bernard de La Salle, a famous soldier of fortune, who had died in the service of the Angevin dukes. In 1402 Antoine entered the court of Anjou, probably as a page, and in 1407 he was at Messina with Duke Louis II, who had gone there to enslave his claim to the kingdom of Sicily. The next years he perhaps spent in Brabant, for he was present at two tournaments given at Brussels and Ghent. With other gentlemen from Brabant, whose names he has preserved, he took part in the expedition of 1415 against the Moors, organized by John I. of Portugal. In 1420 he accompanied Louis III. on another expedition to Naples, making in that year an excursion from Norcia to the Monte della Sibilla, and the neighbouring Lake of Pilate. The story of his adventures on this occasion, and an account, with some sceptical comments, of the local legends regarding Pilate, and the Sibyl’s grotto, form the most interesting chapters of La Salle, which is further adorned with a map of the ascent from Montemaronco. La Sale probably returned with Louis III. of Anjou, who was also comte de Provence, in 1426 to Provence, where he was acting as viguier of Arles in 1429. In 1434 René, Louis’s successor, made La Sale tutor to his son Jean d’Anjou, duc de Calabre, to whom he dedicated, between the years 1438 and 1447, his La Salade, which is a book of the studies necessary for a prince. The primary intention of the title is no doubt the play on his own name, but he explains it on the ground of the miscellaneous character of the book—a salad is composed “of many good herbs.” In 1439 he was again in Italy in charge of the castle of Capua, with the duc de Calabre and his young wife, Marie de Bourbon, when the place was besieged by the king of Aragon. René abandoned Naples, and La Sale returned to Paris about the same time. His advice was sought at the tournaments which celebrated the marriage of the unfortunate Margaret of Anjou at Nancy in 1445; and in 1446, at a similar display at Saumur, he was one of the umpires. La Sale’s pupil was now twenty years of age, and, after forty years’ service of the house of Anjou, La Sale left it to become tutor to the sons of Louis de Luxembourg, comte de Saint Pol, who took him to Flanders and presented him at the court of Philippe le Bon, duke of Burgundy. For his new pupils he wrote at Châlette-sur-Oise, in 1451, a moral work entitled La Sale.

He was nearly seventy years of age when he wrote the work that has made him famous, L’Histoire et plusieurs chronique du petit Jehan de Saintré et de la jeunesse du duc d’Anjou. Saintré is a nickname, dedicated to his former pupil, Jean de Calabre. An envoi in MS. 10,054 (nov. acq. fr.) in the Bibliothèque Nationale, Paris, states that it was completed at Châtelet on the 6th of March 1458 (i.e. 1459). La Sale also announces an intention, never fulfilled, apparently, of writing a romance of Paris et Vienne. The MSS. of Petit Jehan de Saintré usually contain in addition Floridam et Elivo, translated by Rasse de Brunhamel from the Latin of Nicolas de Clamange, 1

1 For his career, see Paul Durrieu, Les Gascons en Italie (Auch, 1885, pp. 107-71).

and dedicated to La Sale; also Addition extraite des Chroniques de Flandre, of which only a few lines are original. But it is not surprising that this dedication of La Sale had delighted to write honourable histories from the time of his “florie jeunesse,” which confirms a reasonable inference from the style of Petit Jehan de Saintré that its author was no novice in the art of romance-writing. Le Réconft à Madame de Neufville, a consolatory epistle including two stories of parental fortitude, was written at Vendeuil-sur-Oise about 1458, and in 1459 La Sale produced his treatise Des ancients tournoir et jaiets d’arme et la Journée d’Ooncle et de Prouesse. He followed his patron to Genappe in Brabant when the Dauphin (afterwards Louis XI.) took refuge at the Burgundian court.

La Sale is generally accepted as the author of one of the most famous satires in the French language, Les Quinze Joyes de la Comédie, which has been disengaged from an acrostic at the end of the Rouen MS. He was also the “acteur” in the collection of licentious stories supposed to be narrated by various persons at the court of Philippe le Bon, and entitled the Cent Nouvelles Nouvelles. One only of the stories is given in his name, but he is credited with the compilation of the whole, for which Louis XI. was long held responsible. A completed copy of this was presented to the Duke of Burgundy at Dijon in 1462. If then La Sale was the author, he probably was still living; otherwise the last mention of him is in 1461.

Petit Jehan de Saintré gives, at the point when the traditions of chivalry were fast disappearing, an account of the education of an archduke, and rules and advice under many different circumstances. When Petit Jehan, aged thirteen, is persuaded by the Dame des Belles-Cousines to accept her as his lady, she gives him systematic instruction in religion, courtesy, chivalry and the arts of war. She materially advances his career until Saintré becomes an accomplished knight, the fame of whose prowess spreads throughout Europe. This section of the romance—apparently didactic in intention—fits in with the other works of education. But it is the second part this light and easy work loses. Its turgid intrigue with Damp Abbé. One of La Sale’s commentators, M. Joseph Boucicaut, ingeniously maintains that the last section is simply to show how the hero, after passing through the other grades of education, learns at the French school to experience and know love. But, however, he be fairly regarded as satirizing the whole theory of “courtly” love, by the simple method of fastening a repulsive conclusion on an ideal case. The contention that the fabliau-like ending of a romance begun in idyllic fashion was due to the corrupt influences of the Dauphin’s exiled court, is inadmissible, for the last page was written when the prince arrived in Brabant in 1456. That it is an anti-clerical satire seems unlikely. The profession of the Napoléon de la Comédie is significantly not mentioned. The language of the book is not disfigured by coarseness of any kind, but, if the brutal ending was the expression of the writer’s real views, there is little difficulty in accepting him as the author of the Quinze Joyes de la Comédie. It is a romance and a satire, and masterpieces in their way and exhibit a much greater dramatic power and grace of dialogue than does Petit Jehan. Some light is thrown on the romance by the circumstances of the duc de Calabre, who was one of the “Belles-Cousines” who contended for the favour of Jacques or Jacques de Lalaing or the Livre des faits de Jacques Lalaing which forms the chief source of the early exploits of Petit Jehan.

The ingenuity of La Sale’s aims appear in his method of construction. The hero is not imaginary. Jehan de Saintré flourished in the Hundred Years’ War, was taken prisoner after Poitiers, with the elder Boucicaut, and was employed in negotiating the treaty of Brétigny. The “fame” of the chevalier de France.” His exploits as related in the romance are, however, founded on those of Jacques de Lalaing (c. 1422-1453), who was brought up at the Burgundian court, and became such a famous knight that he excelled the rivalry of the “Belles-Cousines.” Marie de Bourbon and Marie de Clèves, duchesse d’Orléans. Lalaing’s exploits are related by more than one chronicler, but M. Gustave Raynaud thinks that the Livre des faits de Jacques de Lalaing, published among the tombs of among the tombs of the most notable chivalrous parallel may be found in Petit Jehan, should also be attributed to La Sale, who in that case undertook two accounts of the same hero, one historical and the other fictitious. To complicate matters, he adds that the latter exploits of Petit Jehan, on the Livres des faits de Tom Bouchaut, which gives the history of the younger Boucicaut. The atmosphere of the book is not the rough realities of the English wars in which the real Saintré figured but that of the courts to which La Sale was attached.

The title of Les Quinze Joyes de mariage is, with a profanity characteristic of the time, borrowed from a popular litany, Les Quinze Joies de Notre Dame, and each chapter terminates with a liturgical
refrain voicing the miseries of marriage. Evidence in favour of La Salle's authorship is brought forward by M. E. Gossart (Bibliothèque belge, 1871, pp. 83-7), who quotes from his didactic treatise of La Salle a passage paraphrased from St Jerome's treatise against Licinius which contains the chief elements of the satire. Gaston Paris (Revue de Paris, Dec. 1897) expressed an opinion that to find anything like the malicious penetration by which La Salle divines the most intimate details of married life, and the painful exactness of the criticism, it is necessary to travel as far as Balzac. The theme itself constitutes a novelty in the art of satire, for the dialogue of the Quinze Joys is unusually natural and pregnant. Each of the fifteen vignettes is perfect in its kind. There is no redundancy. The diffuseness of romance is replaced by the methods of the modern critical school.

In the Cent Nouvelles Nouvelles the Italian novella is naturalized in France. The book is modelled on the Decameron of Boccaccio, and owes something to the Latin Facetiae of the contemporary scholar Poggio. The novelle, or short stories, that follow in the Nouvelles have Italian parallels they appear to be independent variants. In most cases the general immorality of the conception is matched by the grossness of the details, but the ninety-eighty story narrates what appears to be a genuine tragedy, and is of an entirely different nature from the other contes. It is another version of the story of Floridam and Elvide already mentioned.

Not content with allowing these achievements to La Salle, some critics have proposed to ascribe to him also the farce of Maître Patelin.

The best editions of La Salle's undoubted and reputed works are:—

Petit Jehan de Saintré by J. M. Guichard (1843); Les Cent Nouvelles Nouvelles by Thomas Wright (Bibli. clavéverine, 1856); Les Quinze Joys by Guichard; and the Cent Nouvelles Nouvelles by Poggio; the Cent Nouvelles Nouvelles have Italian parallels they appear to be independent variants.

When the ten volumes of the Quinze Joys appeared in 1891, La Salle was never printed. For its contents see E. Gossart in the Bibliothèque belge (1871, pp. 77 et seq.). See also the authorities quoted above, and Joseph J. Joyes, Salle, de Salle et de la Nouvelle Salle, Le XVIe siecle (1895), and a review of it by Gaston Paris in the Journal des débats (May 1895); L. Stern, "Versuch über Antoine de Salle," in Archiv für das Studium der neueren Sprachen, vol. xvi.; and G. Raynoud, "Un Nouveau Manuscrit du Petit Jehan de Saintré," in Romanica, vol. xxx. (M. Bk.)

LA SALLE, ANTOINE CHEVALIER LOUIS COLLINET, COUNT (1775-1850), French soldier, belonged to a noble family in Lorraine. His grandfather was Abraham Fabert, marshal of France. Entering the French army at the age of eleven, he had reached the rank of lieutenant when the Revolution broke out. As an aristocrat, he lost his commission, but enlisted in the ranks, where his desperate bravery and innate power of command soon distinguished him. By 1795 he had won back his grade, and was serving as a staff-officer in the army of Italy. On one occasion, at Vicenza, he roused Seyditz's envy by leaping his horse over the parapet of a bridge to avoid capture, and, later, in Egypt, he saved Davout's life in action. By 1800 he had become colonel, and in one combat in that year he had two horses killed under him, and broke seven swords. Five years later, having attained the rank of general of brigade, he was present with his brigade of light cavalry at Austerlitz. In the pursuit after Jena in 1806, though he had but 600 hussars and not one piece of artillery with him, he terrified the commander of the strong fortress of Stettin into surrender, a feat rarely equalled save by that of Cromwell on Bletchington House. Made general of division for this exploit, he was next in the Polish campaign, and at Heilberg saved the life of Murat, grand duc d'Etrurie. When the Peninsular War began, Lasalle was sent out with one of the cavalry divisions, and at Medina de Rio Seco, Gamo and Medellin broke every of the enemy's troops which he charged. A year later, at the head of one of the cavalry divisions of the Grande Armée he took part in the Austrian war. At Vagram he was killed at the head of his men. With the possible exception of Curély, who was in 1809 still unknown, Napoleon never possessed a better leader of light cavalry. Wild and irregular in his private life, Lasalle was far more than a beau sabreur. To talent and experience he added that power of feeling the pulse of the battle which is the true gift of a great leader. A statue of him was erected in Lunévile in 1893. His remains were brought from Austria to the Invalides in 1891.

LA SALLE, RENÉ ROBERT CAVELIER, SIEUR DE (1643-1687), French explorer in North America, was born at Rouen on the 22nd of November 1643. He taught for a time in a school (probably Jesuit) in France, and seems to have forfeited his claim to his father's estate by his connexion with the Jesuits. In 1666 he became a settler in Canada, whither his brother, a Sulpician abbé, had preceded him. From the Seminary of St Sulpice in Montreal La Salle received a grant on the St Lawrence about 8 m. above Montreal, where he built a stockade and established a fur-trading post. In 1669 he sold this post (partly to the Sulpicians who had granted it to him) to raise funds for an expedition to China 1 by way of the Ohio, 2 which he supposed, from the reports of the Indians, to flow into the Pacific. He passed up the St Lawrence and through Lake Ontario to a Seneca village on the Genesee river; thence with an Iroquois guide he crossed the mouth of the Niagara (where he heard the noise of the distant falls) to Ganastogame, an Iroquois colony at the head of Lake Ontario, where he met Louis Joliet and received from him a map of parts of the Great Lakes. La Salle's missionary comrades now gave up the quest for China to preach among the Indians. La Salle discovered the Ohio river, descended it as far as the site of Louisville, Kentucky, and possibly, though not probably, to its junction with the Mississippi, and in 1670 he returned to Canada. He had one of the few of his followers, made his way back to Lake Erie. Apparently he passed through the state of Pennsylvania, Lake Huron and Lake Michigan, and some way down the Illinois river. Little is known of these explorations, for their journals are lost, and the description of his travels rests only on the testimony of the anonymous author of Histoire de M. de la Salle. Before 1673 La Salle had returned to Montreal. Becoming convinced, after the explorations of Marquette and Joliet in 1673, that the Mississippi flowed into the Gulf of Mexico, he conceived a vast project for exploring that river to its mouth and extending the French power to the lower Mississippi Valley. He secured the support of Count Frontenac, then governor of Canada, and in 1674 and 1677 visited France, obtaining from Louis XIV. on his first visit a patent of nobility and a grant of lands about Fort Frontenac, on the site of the present Kingston, Ontario, and on his second visit a patent empowering him to explore the West at his own expense, and giving him the buffalo-hide monopoly. Late in the year 1678, at the head of a small party, he started from Fort Frontenac. He established a post at Niagara Falls, where he spent the winter, and where, his vessel having been wrecked on the larger ship, the "Griffon," in which he sailed up the Great Lakes to Green Bay (Lake Michigan), where he arrived in September 1679. He sent back the "Griffon" freighted with furs, by which he hoped to satisfy the claims of his creditors, he proceeded to the Illinois river, and near what is now Peoria, Illinois, built a fort, which he called Fort Crévecoeur. There he detached Father Hennepin, with one companion, to explore the Illinois to its mouth, and, leaving his lieutenant, Henri de Tonty (c. 1650-1702), 3 with fifteen men, at Fort Crévecoeur, he returned by land, afoot, to Canada to obtain needed supplies, discovering the fate of the "Griffon" (which proved to have been lost), thwarting the intrigues of his enemies and appeasing his creditors. In July 1680 news reached him at Fort Frontenac that nearly all Tonty's men had deserted, after destroying or appropriating most of the supplies; and that twelve of them were on their way to kill him as the surest means of escaping punishment. The story of the Griffon is sarcastically applied to La Salle's settlement on the St Lawrence.

1 The Iroquois seem to have used the name Ohio for the Mississippi, or at least for its lower part; and this circumstance makes the story of La Salle's exploration particularly difficult to disentangle.

2 Tonty (of Tonty) was, in fact, an Italian, born at Gaeta, was La Salle's principal lieutenant, and was the equal of his chief in intrepidity. Before his association with La Salle he had engaged in military service in Europe, during which he had lost a hand. He accompanied La Salle to the mouth of the Mississippi, and was in command of Fort St Louis from the time of its erection until 1702, except during his journeys down the Mississippi in search of his chief. In 1702 he joined d'Iberville in lower Louisiana, and soon after was dispatched to the Chickasaw Indians. This is the last authentic trace of him.
These he met and captured or killed. He then returned to the Illinois, to find the country devastated by the Iroquois, and his supplies all burned. He formed a league of the Western Indians to fight the Iroquois, then went to Michilimackinac, where he found Tonty, proceeded again to Fort Frontenac to obtain supplies and organize his expedition anew, and returned in December 1681 to the Illinois. Passing down the Illinois to the Mississippi, which he reached in February 1682, he floated down that stream to its mouth, which he reached on the 9th of April, and, erecting there a monument and a cross, took formal possession in the name of Louis XIV., in whose honour he gave the name “Louisiana” to the region. He then returned to Michilimackinac, whence, with Tonty, he went again to the Illinois and established a fort, Fort St Louis, probably on Starved Rock (near the present Ottawa, Illinois), around which nearly 20,000 Indians (Illinois, Miamis and others seeking protection from the Iroquois) had been gathered. La Salle then went to Quebec, and La Barre, who had succeeded Frontenac, being unfriendly to him, again visited France (1684), where he succeeded in interesting the king in a scheme to establish a fort at the mouth of the Mississippi and to seize the Spanish posts on the upper river. On July 1685 he set out with four vessels under the command of himself and Captain Beaujeu, a naval officer, he sailed from La Rochelle. Mistaking, it appears, the inlets of Matagorda Bay (which La Salle called St Louis’s Bay) in the present state of Texas, for the mouth of an arm of the Mississippi, he landed there, and Beaujeu, soon afterwards returned to France. The expedition had met with various misfortunes; one vessel had been captured by the Spaniards and another had been wrecked; and throughout La Salle and Beaujeu had failed to work in harmony. Soon finding that he was not at the mouth of the Mississippi, La Salle established a settlement and built a fort, Fort St Louis, on the Lavaca (he called it La Vache) river, and leaving there the greater part of his force, from October 1685 to March 1686 he vainly sought for the Mississippi. He also made two attempts to reach the Illinois country and Canada, and during the second, after two months of fruitless wanderings, he was assassinated, on the 10th of March 1687, by several of his followers, near the Trinity river in the present Texas.

The death of La Salle, after suffering terribly from privation and disease and being attacked by the Indians, was finally broken up, and a force of Spaniards sent against it in 1689 found nothing but dead bodies and a dismantled fort; the few survivors having become domesticated in the Indian villages near by. Some writers, notably J. G. Shea, maintain that La Salle never intended to fortify the mouth of the Mississippi, but was instructed to establish an advanced post near the Spanish possessions, where he was to await a powerful expedition under a renegade Spaniard, Peñalosa, with whom he was to co-operate in expelling the Spaniards from this part of the continent. 1

La Salle was one of the greatest of the explorers in North America. Besides discovering the Ohio and probably the Illinois, he was the first to follow the Mississippi from its upper course to its mouth and thus to establish the connexion between the discoveries of Radisson, Joliet and Marquette in the north with those of De Soto in the south. He was stern, indomitable and fearless.

1 Although La Salle and Don Diego de Peñalosa (1624–1687) presented to the French government independent plans for an expedition against the Spaniards and Peñalosa afterwards proposed their co-operation, there is no substantial evidence that this project was undertaken. Some of the opinion that La Salle and Peñalosa planned an expedition against the Spaniards in the hope that the conclusion of peace between France and Spain would prevent its execution and that he might then use the aid he had thus received in establishing a fortified commercial colony at the mouth of the Mississippi. See E. T. Miller, “The Connection of Peñalosa with the La Salle Expedition,” in the Quarterly of the Texas State Historical Association, vol. v. (Austin, Tex., 1902).

LA SALLE, ST. JEAN BAPTISTE DE (1651–1710), founder of the order of Christian Brothers, was born at Reims. The son of a rich lawyer, his father's influence early secured him a canonry in the cathedral; there he established a school, where free elementary instruction was given to poor children. The enterprise soon broadened in scope; a band of enthusiastic assistants gathered round him; he resolved to resign his canonry, and devote himself entirely to education. His assistants were organized into a community, which gradually rooted itself all over France; and a training-school for teachers, the Collège de Saint-Yon, was set up at Rouen. In 1775, six years after the founder's death, the society was recognized by the pope, under the official title of “Brothers of the Christian Schools”; its members took the usual monastic vows, but did not aspire to the priesthood. During the first hundred years of its existence its activities were mainly confined to France; during the 19th century it spread to most of the countries of western Europe, and has been markedly successful in the United States. When La Salle was canonized in 1900, the total number of brothers was estimated at 15,000.

Although the order has been chiefly concerned with elementary schools, it undertakes most branches of secondary and technical education; and it has served as a model for other societies, in Ireland and elsewhere, slightly differing in character from the original institute.

LA SALLE, a city of La Salle county, Illinois, U.S.A., on the Illinois river, near the head of navigation, 90 m. S.W. of Chicago. Pop. (1900) 10,446, of whom 3471 were foreign-born; (1910 census) 11,537. The city is served by the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, and the Illinois Central railways, and by the Illinois & Michigan Canal, of which La Salle is the western terminus. The city has a public library. The principal industries are the smelting of zinc and the manufacture of cement, rolled zinc, bricks, sulphuric acid and clocks; in 1905 the city's factory products were valued at $3,158,173. In the vicinity large quantities of coal are mined, for which the city is an important shipping point. The municipal owners and operates the waterworks and the electric lighting plant. The first settlement was made here in 1830; and the place which was named in honour of the explorer, René Robert Cavelier, Sieur de La Salle, was chartered as a city in 1852 and incorporated in 1856.

LASAULX, ARNOLD CONSTANTIN PETERS FRANZ VON (1839–1886), German mineralogist and petrographer, was born at Castellaun near Coblenz on the 14th of June 1839. He was educated at Berlin, where he took his Ph. D. in 1868. In 1875 he became professor of mineralogy at Breslaw, and in 1880 professor of mineralogy and geology at Bonn. He was distinguished for his researches on minerals and on crystallography, and he was one of the earlier workers on microscopic petrography. He described in 1878 the eruptive rocks of the district of Saar and Moselle. In 1880 he edited Der Aetna from the MSS. of Dr W. Sartorius von Waltershausen, the results of observations made between the years 1834–1866. He was the author of Elemente der Petrographie (1873), Einführung in die Gesteinslehre (1885), and Précis de pétrographie (1887). He died at Bonn on the 25th of January 1886.
LASCAR, the name in common use for all oriental, and especially Indian, sailors, which has been adopted in England into the Merchant Shipping Acts, though without any definition. It is also used in a sense derived from the Persian, although in that sense it is still used in India, e.g. Lashkar, originally the camp, now the permanent capital, of Sindhia at Gwalior. It would seem to have been applied by the Portuguese, first to an inferior class of men in military service (cf. "gun-lascars"), and then to sailors as early as the 17th century. The form askari on the east coast of Africa, equivalent to "sepoy," comes from the Arabic 'askar=army, which is believed to be itself taken from the Persian.

LASCARIS, CONSTANTINE (d. 1493 or 1500), Greek scholar and grammarian, one of the promoters of the revival of Greek learning in Italy, was born at Constantinople. He was a member of the noble Bithynian family, which had furnished three emperors of Nicea during the 13th century. After the fall of Constantinople in 1453, he took refuge first in Corfu and then in Italy, where Francesco Sforza, duke of Milan, appointed him Greek tutor to his daughter. Here was published his Grammatica Graeca, sive compendium octo orationum partim, remarkable as being the first book entirely in Greek issued from the printing press. After leaving Milan, Lascaris taught in Rome under the patronage of Cardinal Bessarion, and in Naples, whither he had been summoned by Ferdinand I. to deliver into Greek recusation (1450). In 1451, on the invitation of the inhabitants, he settled in Messina, Sicily, where he continued to teach publicly until his death. Among his numerous pupils here was Pietro Bembo. Lascaris bequeathed his library of valuable MSS. to the senate of Messina; the collection was afterwards carried to Spain and lodged in the Escorial. The Grammatica, which has often been reprinted, is the only work of value produced by Lascaris. Some of his letters are given by J. Iriarte in the Regiae Bibliothecae Marcianae codices Graeci secundum seriem ordinem ed. (Venice, 1769). His name is known to modern readers in the romance of A. F. Villemaire, Lascaris, ou les Grecs du quinzième siècle (1825). See also J. E. Sandys, Hist. Class. Schol., ed. 2, vol. ii. (1898), pp. 76 f. roll.

LASCARIS, JOANNE [JOHN], or JANUS (c. 1445-1533), Greek scholar, probably the younger brother of Constantine Lascaris, surnamed Rhyndacus from the river Rhyndacus in Bithynia, his native province. After the fall of Constantinople he was taken to the Peloponess, thence to Crete, and ultimately found refuge in Florence at the court of Lorenzo de' Medici, where he was appointed to the post of minister. Here was published his Novellae in Homerum librum et fragmenta (1500), which is the first comprehensive work on classical antiquity. Lascaris was a prolific writer, and his works were widely read in the 16th century. He is best known for his work on the Greek language, and his Grammar of the Greek Language is still used today as a standard text.

LASCAS, BARTOLOME DE (1474-1566), for some time bishop of Chiapa in Mexico, and known to posterity as "The Apostle of the Indies," was a native of Seville. His father, one of the companions of Columbus in the voyage of 1492, whereas in the discovery of the New World, sent him to Salamansa, where he graduated. In 1498 he accompanied his father in an expedition under Columbus to the West Indies, and in 1502 he went with Nicolás de Ovando, the governor, to Hayti, where in 1510 he was admitted to holy orders, being the first priest ordained in the American colonies. In 1511 he passed over to Cuba to take part in the work of "population and pacification," and in 1513 or 1514 he witnessed and vainly endeavoured to check the massacre of Indians at Caona. Soon afterwards there was assigned to him and his friend Renteria a large village in the neighbourhood of Zagua, with a number of Indians attached to it in what was known as repartimiento (allotment); like the rest of his countrymen he made the most of this opportunity for growing rich, but occasionally celebrated mass and preached. Soon, however, having become convinced of the injustice connected with the repartimiento system, he began to preach against it, at the same time giving up his own slaves. With the consent of his partner he resolved to go to Spain on behalf of the oppressed natives, and the result of his representations was that in 1516 Cardinal Jimenez caused a commission to be sent out for the reform of abuses, Las Casas himself, with the title of "protector of the Indians," being appointed to advise and report on them. This commission had not been long at San Domingo before Las Casas perceived the indifference of his coadjutors to the cause which he himself had at heart, and July 5, 1517 found him again in Spain, where he developed his scheme for the complete liberation of the Indians—a scheme which not only included facilities for emigration from Spain, but was specifically aimed at the right of importing twelve negro slaves. The emigration movement proved a failure, and Las Casas lived long enough to express his shame for having been so slow to see that Africans were as much entitled to freedom as were the natives of the New World. Overwhelmed with disappointment, he retired to the Dominican monastery in Haiti; he joined the order in 1522 and devoted eight years to study. About 1530 he appears to have revisited the Spanish court, but on what precise errand he is not known; the confusion concerning this period of his life extends to the time when, after visits to Mexico, Nicaragua, Peru and Guatemala, he undertook an expedition in 1537 into Tuzulutan, the inhabitants of which were, chiefly through his tact, peaceably converted to Christianity, mass being celebrated for the first time amongst them in the newly founded town of Rabiln in 1538. In 1539 Las Casas was sent to Spain to obtain Dominican recruits, and through Loyasa, general of the order, and confessor of Charles V., he was successful in obtaining royal orders and letters favouring his enterprise. During this stay in Europe, which lasted more than four years, he visited Germany to see the emperor; he also (1542) wrote his Véntima Rasones, in defence of the liberties of the Indians and the Breve Razonamiento de la Destrucción de las Indias Occidentales, the latter of which was published some twelve years later. In 1543 he refused the Mexican bishopric of Cuzco, but was prevailed upon to accept that of Chiapa, for which he sailed in 1544. Thwarted at every point by the officials, and outraged by his countrymen in his attempt to carry out the new laws which his humanity had procured, he returned to Spain and resigned his dignity (1547). In 1550 he met Sepulveda in public debate on the theses drawn from the recently published Apología pro libro de justis bella causis, in which the latter had maintained the lawfulness of waging unprovoked war upon the natives of the New World. The course of the discussion may be traced in the account of the Disputa contained in the Obras (1552). In 1565 Las Casas successfully remonstrated with Philip II. against the financial project for selling the reversion of the encomiendas—a project which would have involved the Indians in hopeless bondage. In July of the following year he died at Madrid, whither he had gone to urge (and with success) the necessity of restoring a court of justice which had been suppressed in Guatemala. His Historia de las Indias was not published till 1875-1876.

Sir Arthur Helps' Life of Las Casas (London, 1868) has not been superseded; but see also F. A. MacNutt, Bartholomew de Las Casas (1909).
LAS CASES, EMMANUEL AUGUSTIN DIEUDONNÉ MARIN JOSEPH, MARQUIS (1766-1842), French official, was born at the castle of Las Cases near Revel in Languedoc. He was educated at the military schools of Vendôme and Paris; he entered the navy and took part in various engagements of the years 1781-1782. The outbreak of the Revolution in 1789 caused him to "emigrate," and he spent some years in Germany and England, sharing in the disastrous Quiberon expedition (1795). He was one of the few survivors and returned to London, where he lived in poverty. He returned to France during the Consulate with other royals who rallied to the side of Napoleon, and stated afterwards to the emperor that he was "conquered by his glory." Not until 1810 did he receive much notice from Napoleon, who then made him a chamberlain and created him a count of the empire (he was marquis by hereditary right). After the first abdication of the emperor (11th of April 1814), Las Cases retired to England, but returned to serve Napoleon during the Hundred Days. The second abdication opened up for Las Cases the most noteworthy part of his career. He withdrew with the ex-emperor and a few other trusty followers to Rochefort; and it was Las Cases who first proposed and strongly urged the emperor to throw himself on the generosity of the British nation. Las Cases made the first overtures to Captain Maitland of H.M.S. "Belleroophon" and received a guarded reply, the nature of which he afterwards misrepresented. Las Cases accompanied the ex-emperor to St Helena and acted informally but very assiduously as his secretary, taking down numerous notes of his conversations which thereafter took form in the famous Mémorial de Ste Hélène. The limits of this article preclude an attempt at assaying the value of this work. It should be read with great caution, as the compiler did not scruple to insert his own thoughts and to colour the expressions of his master. In some cases he misstated facts and even fabricated documents. It is far less trustworthy than the record penned by Gourgaud in his Journal. Disliked by Montholon and Gourgaud, Las Cases seems to have sought an opportunity to leave the island when he had accumulated sufficient literary material. However that may be, he infringed the British regulations in such a way as to lead to his expulsion by the governor, Sir Hudson Lowe (November, 1816). He was sent first to the Cape of Good Hope and thence to Europe, but was not at first allowed by the government of Louis XVIII. to enter France. He resided at Brussels; but, gaining permission to come to Paris after the death of Napoleon, he took up his residence there, published the Mémorial, and soon gained an enormous sum from it. He died in 1842 at Passy.

See Mémorial de Ste Hélène (11 vols., Paris, 1848-1850); Mémorial de Ste Hélène, ou observations critiques, etc. (2 vols., Paris, 1824), anonymous, but known to be by Grille and Musset-Pathay. See also Gourgaud, Montholon, and Lascases, "Sur les relations de Ste Hélène." (J. H. R.)

LASHIO, the headquarters of the superintendent, northern Shan States, Burma, situated in 22° 56' N. and 97° 45' E. at an altitude of 3100 ft., on a low spur overlooking the valley of the Nam Yao. It is the present terminus of the Mandalay-Kun Long railway and of the government cart road from Mandalay, from which it is 178 m. distant. It consists of the European station, with court house and quarters for the civil officers; the military police post, the headquarters of the Lashio battalion of military police; the native station, in which the various nationalities, Shans, Burmans, Hindus and Mahomedans, are divided into separate quarters, with reserves for government servants and for the temporary residences of the five sawbwas of the northern Shan States; and a bazaar. Under Burmese rule Lashio was also the centre of authority for the northern Shan States, but the Burmese post in the valley was close to the town. Lashio valley was formerly very populous, but a rebellion, started by the sawbwa of Hsenwi, about ten years before the British occupation, ruined it, and it is only slowly approaching the prosperity it formerly enjoyed; pop. (1901) 2565. The annual rainfall averages 54 in. The average maximum temperature is 80° in summer and 70° in winter. The average minimum 55° and 53° respectively.

LASKER, EDUARD (1839-1884), German publicist, was born on the 14th of October 1829, at Jarotschin, a village in Posen, being the son of a Jewish tradesman. He attended the gymnasium, and afterwards the university of Breslau. In 1848, after the outbreak of the revolution, he went to Vienna and entered the students' legion which took so prominent a part in the disturbances; he fought against the imperial troops during the siege of the city in October. He then continued his legal studies at Breslau and Berlin, and after a visit of three years to England, then the model state for German liberals, entered the Prussian judicial service. In 1870 he left the government service, and in 1873 was appointed to a administrative post in the service of the city of Berlin. He had brought to the notice of the political world by some articles he wrote from 1861 to 1864, which were afterwards published under the title Zur Verfassungsgeschichte Preussens (Leipzig, 1874), and in 1865 he was elected member for one of the districts of Berlin in the Prussian parliament. He joined the radical or Fortschritts party, and in 1867 was also elected to the German parliament, but he helped to form the national liberal party, and in consequence lost his seat in Berlin, which remained faithful to the radicals; after this he represented Magdeburg and Frankfort-on-Main in the Prussian, and Meiningen in the German parliament. He threw himself with great energy into his parliamentary duties, and quickly became one of its most popular and most influential members. An optimist and idealist, he joined to a fervent belief in liberty an equal enthusiasm for German unity and the idea of the German state. His motion that Baden should be included in the North German Confederation in January 1870 caused much embarrassment to Bismarck, but was not without effect in hastening the crisis of 1870. His great work, however, was the share he took in the judicial reform during the ten years 1867-1877. To him more than to any other single individual is due the great codification of the law. While he again and again was able to compel the government to withdraw or amend proposals which seemed dangerous to liberty, he opposed those liberals who, unable to obtain all the concessions which they called for, refused to vote for the new laws as a whole. A speech made by Lasker on the 7th of February 1873, in which he attacked the management of the Pomeranian railway, caused a great sensation, and his exposure of the financial mismanagement brought about the fall of Hermann Wagener, one of Bismarck's most trusted assistants. By this action he caused, however, some embarrassment to his party. This is generally regarded as the beginning of the reaction against economic liberalism by which he and his party were to be deprived of their influence. He refused to follow Bismarck in his financial and economic policy after 1875, always un- sympathetic to the chancellor, he was now selected for his most bitter attacks. Between the radicals and socialists on the one side and the government on the other, like many of his friends, he was unable to maintain himself. In 1879 he lost his seat in the Prussian parliament; he joined the Secessio, but was ill at ease in his new position. Broken in health and spirits by the incessant labours of the time when he did "half the work of the Reichstag," he went in 1883 for a tour in America, and died suddenly in New York on the 5th of January 1884.

Lasker's death was the occasion of a curious episode, which caused much discussion at the time. The American House of Representatives adopted a motion of regret, and added to it these words: "That his loss is not alone to be mourned by the citizens of his native land, where his firm and constant exposition of, and devotion to, free and liberal ideas have materially advanced the social, political and economic conditions of these people, but by the lovers of liberty throughout the world. This motion was sent through the American legation in Berlin to be transmitted to the President of the German republic; it was to ask Bismarck officially to communicate a resolution in which a foreign parliament expressed an opinion the exact wording of which his advice had always followed. Bismarck therefore refused to communicate the resolution, and returned it through the German minister at Washington.

Among Lasker's writings may be mentioned, "Die Geschichte der parlamentarischen Entwickelung in Preussien" (Leipzig, 1875), Die Zukunft des Deutschen Reichs (Leipzig, 1877) and Wege und Ziele der
LASKI

LASKI, the name of a noble and powerful Polish family, is taken from the town of Lask, the seat of their lordship.

Jan Laski, the elder (1456–1531), Polish statesman and ecclesiastic, appears to have been largely self-taught and to have owed everything to the remarkable mental alertness which was hereditary in the Laski family. He took orders betimes, and in 1484 was secretary to the Polish chancelor Zawisza Kurozwecki, in which position he acquired both influence and experience. The aged chancelor entrusted the sharp-witted young ecclesiastic with the conduct of several important missions. Twice, in 1495 and again in 1500, he was sent to Rome, and once on a special embassy to Flanders, of which he has left an account. On these occasions he had the opportunity of displaying diplomatic talent of a high order. On the accession to the Polish throne in 1501 of the indolent Alexander, who had little knowledge of Polish affairs and chiefly resided in Lithuania, Laski was appointed by the senate the king’s secretary, in which capacity he successfully opposed the growing separatist tendencies of the grand-duchy and maintained the influence of Catholicism, now seriously threatened there by the Muscovite propaganda. So struck was the king by his ability that on the death of the Polish chancelor in 1503 he passed over the vice-chancellor Macies Dziewicki and confirmed the great seal to Laski. As chancellor Laski was further rewarded with the order of the Golden Fleece, a decoration of great merit, against the lower orders, going so far as to pass an edict excluding henceforth all plebeians from the higher benefits of the church. Nevertheless he approved himself such an excellent public servant that the new king, Sigismund I., made him one of his chief counsellors. In 1517 the chancelor, who ecclesiastically was still only a canon of Cracow, obtained the coveted dignity of archbishop of Gnesen which carried with it the primacy of the Polish church. In the long negotiations with the restive and semi-rebellious Teutonic Order, Laski rendered Sigismund most important political services, proposing as a solution of the question that Sigismund should be elected grand master, while he, Laski, should surrender the primacy to the new candidate of the knights, Albert of Brandenburg, a solution which would have been far more profitable to Poland than the ultimate settlement of 1525. In 1513 Laski was sent to the Lateran council, convened by Pope Julius II., to plead the cause of Poland against the French, who both as an orator and as a diplomat, he brilliantly distinguished himself. This mission was equally profitable to his country and himself, and he succeeded in obtaining from the pope for the archbishops of Gnesen the title of legati nati. In his old age Laski’s partiality for his nephew, Hieronymus, led him to support the candidature of John Zapolya, the protegé of the Turks, for the Hungarian crown so vehemently against the Habsburgs that Clement VII. excommunicated him, and the shock of this disgrace was the cause of his sudden death in 1531.

Of his numerous works the most noteworthy are his collection of Polish statutes entitled: Statuta provinciae gnesensis antiqua, & c. (Cracow, 1525–1528) and De Rulhenorum nationibus eorumque erroribus, printed at Nuremberg.

See Heinrich Reymond, Ziegenh, Joh., Laski, Erzbishof in Gnesen (Vienna, 1874); and Jan Korytkowski, Jan Laski, Archibishop of Gnesen (Gnesen, 1880).

HIERONYMUS JAROSLAW LASKI (1496–1542), Polish diplomatist, nephew of Archbishop Laski, was successively palatine of Inowroclaw and of Sieradz. His first important mission was to Paris in 1524, ostensibly to contract an anti-Turkish league with the French king, but really to bring about a matrimonial alliance between the dauphin, afterwards Henry II., and the daughter of King Sigismund I., a project which failed through no fault of Laski’s. The collapse of the Hungarian monarchy at Mohacs (1526) first opened up a wider career to Laski’s adventurous activity. Contrary to the wishes of his own sovereign, Sigismund I., whose pro-Austrian policy he detested, Laski entered the service of John Zapolya, the Magyar competitor for the Hungarian throne, thereby seriously compromising Poland both with the emperor and the pope. Zapolya despatched him on an embassy to Paris, Copenhagen and Munich for help, but on his return he found his patron a refugee in Transylvania, whither he had retired after his defeat by the German king Ferdinand I. at Tokay in 1527. In his extremity Zapolya placed himself under the protection of the sultan, Laski being sent to Constantinople as his intermediary. On his way thither he was attacked and robbed of everything, including his credentials and the rich presents without which no negotiations were deemed possible at the Porte. But Laski was nothing if not audacious. Proceeding on his way to the Turkish capital empty-handed, he nevertheless succeeded in gaining the confidence of Giritli, the favourite of the grand vizier, and ultimately persuaded the sultan to befriend Zapolya and to proclaim him king of Hungary. He went still further, and without the slightest authority for his action concluded a ten years’ truce between his old master King Sigismund of Poland and the Porte. He then returned to Hungary at the head of 10,000 men, with whose aid he enabled Zapolya to re-establish his position and defeat Ferdinand at Saros-Patak. He was rewarded with the countship of Zips and the governor-generalship of Transylvania. But his influence excited the jealousy of the Magyars, and Zapolya was persuaded to imprison him. On being released by the intercession of the Polish grand hetman, Tarnowski, he became the most violent opponent of Zapolya. Shortly after his return to Poland, Laski died suddenly at Cracow, probably poisoned by one of his innumerable enemies.

See Alexander Hirschberg, Hieronymus Laski (Pol.) (Lemberg, 1888).

Jan Laski, the younger (1499–1560), also known as Johannes a Lascio, Polish reformer, son of Jaroslav (d. 1523) voivode of Sieradz and nephew of the famous Archbishop Laski. During his academical course abroad he made the acquaintance of Zwingli and Erasmus and returned to Poland in 1526 saturated with the new doctrines. Nevertheless he took orders, and owing to the influence of his uncle obtained the bishopric of Veszprem in Hungary from King John Zapolya, besides holding a canonry of Cracow and the office of royal secretary. In 1531 he resigned all his benefices rather than give up a woman whom he had secretly married, and having incurred general reprobation and the lasting displeasure of his uncle the archbishop, he fled to Germany, where ultimately (1543) he adopted the Augsburg Confession. For the next thirteen years Laski was a wandering apostle of the new doctrines. He was successively superintendent of Schwerin, attempted to become a magistrate in Friesland, passed from house to house in London, where he became a member of the so-called ecclesia peregrinorum, a congregation of foreign Protestants exiled in consequence of the Augsburg Interim of 1548 and, on being expelled by Queen Mary, took refuge first in Denmark and subsequently at Frankfort-on-Main, where he was greatly esteemed. From Frankfort he addressed three letters (printed at Basel) to King Sigismund, Augustus, and the Polish gentry and people, urging the conversion of Poland to Protestantism. In 1536, during the brief triumph of the anti-catholics, he returned to his native land, took part in the synod of Brzesc, and published a number of polemical works, the most noteworthy of which were Forma ac ratio tota ecclesiastici ministerii in peregrinorum Ecclesiae instituta (Pinczow, 1536), and in Polish, History of the Cruel Persecution of the Church of God in 1537, republished in his Opera, edited by A. Kuyper at Amsterdam in 1866. He died at Pinczow in January 1566 and was buried with great pomp by the Polish Protestants, who also struck a medal in his honour. Twice married but childless, he left as his only issue his nephew (?) Albert Laski, who visited England in 1593, wasted a fortune in aid of Dr Dee’s craze for the “philosopher’s stone.” Laski’s writings are important for the organization of the ecclesia peregrinorum, and he was concerned in the Polish version of the Bible, not published till 1563.

LAS PALMAS—LASSALLE 235

(R. N. B.)

LAS PALMAS, the capital of the Spanish island of Grand Canary, in the Canary archipelago, and of an administrative district which also comprises the islands of Lanzarote and Fuerteventura; on the east coast, in 28° 7' N. and 5° 24' W. Pop. (1900) 44,517. Las Palmas is the largest city in the Canary Islands, of which it was the capital until 1833. It is the seat of a court of appeal, of a brigadier, who commands the military forces in the district, of a civil lieutenant-governor, who is independent of the governor-general except in connexion with elections and municipal administration, and of a bishop, who is subordinate to the archbishop of Seville. The palms from which the city derives its name are still characteristic of the fertile valley which it occupies. Las Palmas is built on both banks of a small river, and although parts of it date from the 16th century, it is on the whole a clean and modern city, well drained, and supplied with pure water, conveyed by an aqueduct from the highlands of the interior. Its principal buildings include a handsome cathedral, founded in the 16th century but only completed in the 19th, a theatre, a museum, an academy of art, and several hospitals and good schools. The modern development of Las Palmas is largely due to the foreign merchants, and especially to the British who control the greater portion of the local commerce. La Luz, the port, is connected with Las Palmas by a railway 4 m. long; it is a free port and harbour of refuge, officially considered the third in importance of Spanish ports, but actually the first in the matter of tonnage. It is strongly fortified. The harbour, protected by the promontory of La Isleta, which is connected with the mainland by a narrow bar of sand, can accommodate the largest ships, and affords secure anchorage in all weathers. Ships can discharge at the breakwater (1257 yds. long) or at the Santa Catalina mole, constructed in 1883-1902. The minimum depth of water alongside the quays is 42 ft. There are floating water-tanks, numerous lighters, tirit and other cranes, repairing workshops, and very large supplies of coal ashore. La Luz is one of the principal Atlantic coaling stations, and the coal-trade is entirely in British hands. Other important industries are shipbuilding, fishing, and the manufacture of glass, leather and hats. The chief exports are fruit, vegetables, sugar, wine and coal. La Palma resembles the capital in the manner of its life. A luxurious life, as of the court, was kept in the old palace by the Jesuits. The modern development of Las Palmas is largely due to the foreign merchants, and especially to the British who control the greater portion of the local commerce.

LASSALLE, FERDINAND (1825-1864). German socialist, was born at Breslau on the 17th of April 1825, of Jewish extraction. His father, a prosperous merchant in Breslau, intended Ferdinand for a business career, and sent him to the commercial school at Leipzig; but the boy got himself transferred to the university, first at Breslau, and afterwards at Berlin. His favourite studies were philology and philosophy; he became an ardent Hegelian. Having completed his university studies in 1845, he began to write a work on Heraclitus from the Hegelian point of view; but it was soon interrupted by more stirring interests, and did not see the light for many years. It was in Berlin, towards the end of 1845, that he met the lady with whom his life was to be associated in so remarkable a way, the Countess Hatzfeldt. She had been separated from her husband for many years, and was at feud with him on questions of property and the custody of their children. Lassalle attached himself to the cause of the countess, whom he believed to have been outrageously wronged, made special study of law, and, after bringing the case before thirty-six tribunals, reduced the powerful count to a compromise on terms most favourable to his client. The process, which lasted ten years, gave rise to not a little scandal, especially that of the Cassetengeschichte which pursued Lassalle all the rest of his life. This "affair of the casket" arose out of an attempt by the countess's friends to get possession of a bond for a large life annuity settled by the count on his mistress, a Baroness Meyendorf, to the prejudice of the countess and her children. Two of Lassalle's comrades succeeded in carrying off the casket, which contained the lady's jewels, from the baroness's room at an hotel in Cologne. They were prosecuted for theft, one of them being condemned to six months' imprisonment. Lassalle, accused of moral complicity, was acquitted on appeal. He was not so fortunate in 1849, when he underwent a year's durance for resistance to the authorities of Düsseldorf during the troubles of that stormy period. But going to prison was a familiar experience in Lassalle's life. Till 1850, Lassalle resided mostly in the Rhine country, prosecuting the suit of the countess, finishing the work on Heraclitus, which was not published till 1858, taking little part in political agitation, but ever a helpful friend of the working men. He was not allowed to live in Berlin because of his connexion with the disturbances of 1848. In 1859, however, he entered the city disguised as a carter, and, through the influence of Humboldt with the king, got permission to stay there. The same year he published a remarkable pamphlet on the Italian War and the Mission of Prussia, in which he warned his countrymen against going to the rescue of Austria in her war with France. He pointed out that if France drove Austria out of Italy she might annex Savoy, but could not prevent the restoration of Italian unity under Victor Emmanuel. France was doing the work of Germany by weakening Austria; Prussia should form an alliance with France to drive out Austria and make herself supreme in Germany. After their realization by Bismarck these ideas have become sufficiently commonplace; but they were nowise obvious when thus published by Lassalle. In 1851 he published a great work in two volumes, System der erworbenen Rechte (System of Acquired Rights).

Now began the short-lived activity which was to give him an historical significance. It was early in 1859, when the struggle of Bismarck with the Prussian liberals was already begun. Lassalle, a democrat of the most advanced type, saw that an opportunity had come for asserting a third great cause—that of the working men—which would outflank the liberalism of the middle classes, and might even command the sympathy of the government. His political programme was, however, entirely subordinate to the social, that of bettering the condition of the working classes, for which he believed the schemes of Schulze-Delitzsch were utterly inadequate. Lassalle flung himself into the career of agitator with his accustomed vigour. His worst difficulties were with the working men themselves, among whom he met the most discouraging apathy. His mission as organizer and emancipator of the working class lasted only two years and a half. In that period he issued about twenty separate publications, mostly of pamphlets and newspapers, but one of them, that against Schulze-Delitzsch, a considerable treatise, and all full of keen and vigorous thought. He founded the "Allgemeiner Deutscher Arbeiterverein," was its president and almost single-handed champion, conducted its affairs, and carried on a vast correspondence, not to mention about a dozen state prosecutions in which he was during that period involved. Berlin, Leipzig, Frankfort and the industrial centres on the Rhine were the chief scenes of his activity. His greatest success was on the Rhine, where in the summers of 1863 and 1864 his travels as missionary of the new gospel resembled a triumphal procession. The agitation was growing rapidly, but he had achieved little substantial success when at a most unworthy death closed his career.

While posing as the messiah of the poor, Lassalle was a man of decidedly fashionable and luxurious habits. His successes were always accompanied by huge and ostentatious parties. It was the most piquant feature of his life that he, one of the gilded youth, a connoisseur in wines, and a learned man to boot, had become agitator and the champion of the working man. In one of the literary and fashionable circles of Berlin he had met a Fräulein von Dönniges, for whom he at once felt a passion, which was ardently reciprocated. In the summer of 1864 he met her again on the Rigi, when they resolved to marry. She was a young lady of twenty, decidedly unconventional and original in character, but the daughter of a Bavarian
diplomatist then resident at Geneva, who would have nothing to do with Lassalle. The lady was imprisoned in her own room, and soon, apparently under the influence of very questionable premises, was executed. The death of the heroic Wallachian, Count von Racowitza, Lassalle sent a challenge both to the lady’s father and her betrothed, who was accepted by the latter.

At the Carouge, a suburb of Geneva, the meeting took place on the morning of August 28, 1861, when Lassalle was mortally wounded, and he died on the 31st of August.

In spite of such a foolish ending, his funeral was that of a martyr, and by many of his adherents he has been regarded since with feelings almost of religious devotion.

Lassalle did not lay claim to any special originality as a socialist thinker, nor did he publish any systematic statement of his views. Yet he had a profound scientific insight into the historical Hegelian he saw three stages in the development of labour: the ancient and feudal period, which, through the subjection of the labourer, sought solidarity without freedom; the reign of capital and the middle classes, established in 1789, in which might destroyed solidarity, and the new state, beginning in 1848, which would reconcile solidarity with freedom by introducing the principle of association. It was the basis and starting-point of his opinions that, under the empire of capital and so long as the working man was a mere beast of burden, wages could never be equal to what could be expected. This position he founded on the law of wages formulated by Ricardo, and accepted by all the leading economists, that wages are controlled by the ordinary relations of supply and demand, and that as wages increase, the resultant increase of population, which, by increasing the supply of labour, is followed by a corresponding fall of wages. Thus population increases or decreases in fixed relation to the rise or fall of wages. The condition of the working man is of the direct consequence of the value of the wages which his living required for his subsistence, and the continued supply of his kind. Lassalle held that the co-operative schemes of Schultze-Delitsch on the principle of “self-help” were utterly inadequate; for the obvious reason that the working classes were destitute of capital to carry out these schemes; and that his doctrine did not go beyond the mere empty pockets against the capitalists he compared to a battle with teeth and nails against modern artillery. In short, Lassalle accepted the orthodox political economy to show that the inevitable operation of existing laws left no hope for the working classes, and that no remedy could be found but by abolishing the conditions in which these laws had their validity—in other words, by abolishing the present relations of labour and capital altogether. And this could only be done by the productive association of the working classes—money provided by the state. And he held that such association should be the voluntary act of the working men, the government merely reserving the right to examine the books of the various societies, and to interfere only in cases of fraud or in case of the rules of business usually followed in such transactions. But how move the government to grant such a loan? Simply by introducing (direct) universal suffrage. The working men were an overwhelming majority; they were the state, and should control the government. The working man, in other words, the “new” man, would, up to a great political power, in the way thus indicated, by peaceful and quiet individualism, without violence or insurrection, might attain the goal of productive association. In this way the fourth estate would be—Eberhard von Hase—Verfassungswesen;—Ist und sollten als der Reiche, was ist (1848–53).

The best biography of Lassalle is H. Oncken’s Lassalle (Stuttgart, 1892); another excellent work on his life and writings is George Brandes’ Danish work, Ferdinand Lassalle (German translation, 4th ed., Leipzig, 1900). See also A. Aaberg, Ferdinand Lassalle, ed. C. E. Aaberg (1934). Modern, Lassalle als Sozialokonom (Berlin, 1894); Brandt, F. Lassalle’s sozialökonomische Ansichten und praktische Vorschüsse, 2 ed. (Jena, 1895); Seilhier, Études sur Ferdinand Lassalle (Paris, 1897); E. Bernstein, Ferdinand Lassalle and seine Bedeutung für die Arbeiterklasse (Berlin, 1882); T. D. Masson and D. M. M’Kee, The Trafalgar of the Soul (1881); and the death; the most notable books are: Meine Beziehungen zu F. Lassalle, by Helene von Racowitza, a very strange book; Einladungen über das tragische Lebendese F. Lassalle’s by B. Becker; Im Leben des durchschnittlichen Menschen der neuen Zeit by A. Kutschbach, and George Meredith’s Tragic Comedians (1880). (T.K.)

LASSEN, CHRISTIAN (1800–1786), German orientalist, was born on the 22nd of October 1800, at Bergen in Norway. Having received his earliest university education at Christiansia, he went to Germany, and continued his studies at Heidelberg and Bonn.

In the latter university Lassen acquired a sound knowledge of Sanskrit. He next spent three years in Paris and London, engaged in copying and collating MSS., and collecting materials for future research, especially in reference to the Hindu drama and philosophy. During this period he published, jointly with E. Burnout, his first work, Essai sur le Pâli (Paris, 1826). On his return to Bonn he studied Arabic, and took the degree of Ph.D., his dissertation discussing the Arabic notices of the geography of the Punjab (Commentationes geographica atque historica de Pentapolamia Indica, Bonn, 1827). Soon after he was admitted Privatdozent, and in 1830 was appointed extraordinary and in 1840 ordinary professor of Old Indian language and literature.

In spite of a tempting offer from Copenhagen, in 1841, Lassen remained faithful to the university of his adoption to the end of his life. He died at Bonn on the 5th of May 1876, having been affiliated with academia through all his earlier years. As early as 1834 he was relieved of the duty of lecturing.

In 1829–1831 he brought out, in conjunction with August W. von Schlegel, a critical annotated edition of the Hitopadesa. The appearance of this edition marks the starting-point of the critical study of Sanskrit literature. At the same time Lassen assisted von Schlegel in editing and translating the first two cantos of the epic Rñmlayana (1829–1835). In 1832 he brought out the text of the first act of Bhavabhûti’s drama, Mālatāśākhā, and a complete edition, with a Latin translation, of the Śāṅkhyavī-kārikā. In 1837 followed his edition and translation of Jayadeva’s charming lyrical drama, Śrî Śrī Rāmāyana, and in 1842 he published a new text of the Sanscritica, which came out the following year (new ed. by Johann Gildemeister, 1868), contained several hitherto unpublished texts, and did much to stimulate the study of Sanskrit in German universities.

In August 1848, he published his Critical History of the Old Persian cuneiform inscriptions, thereby anticipating, by one month, Burnout’s Mémoire on the same subject, while Sir Henry Rawlinson’s famous memoir on the Behistun inscription, drawn up in 1835, and published in the Edinburgh Review, was at the same time, about the same time, did not reach the Royal Asiatic Society until three years later. Subsequently Lassen published, in the sixth volume of his journal (1845), a collection of all the Old Persian cuneiform inscriptions, giving the explanation of every inscription and every word. It was in Europe who took up, with signal success, the decipherment of the newly-discovered Bactrian coins, which furnished him the materials for his Zur Geschichte der griechischen und indo-sythischen Künste in Baktrien, Kandahar, and Indien (1838). He contemplated the historical study of the two Sanskrit languages, and the preparation of the first five fargards (1852), he felt that his whole energies were required for the successful accomplishment of the great undertaking of his life—his Indische Allerleihen. In this work—completed in four volumes, published respectively in 1847 (2nd ed., 1867), 1849 (2nd ed., 1874), 1858 and 1861—forms one of the greatest monuments of untried industry and critical scholarship, everything that could be gathered from native and foreign sources, relative to the political, social and intellectual development of India, from the
earliest times down to the Mahommedan invasion, was worked up by him into a connected historical account.

**Lassus, Eduard** (1530–1594), Belgian musical composer, was born in Copenhagen, but was taken as a child to Brussels and educated at the Brussels Conservatoire. He won the **prix de Rome** in 1531, and went for a long tour in Germany and Italy. He settled at Weimar, where in 1581 he succeeded Liszt as conductor of the opera, and he died there on the 15th of January 1594. Besides many well-known songs, he wrote operas—**Landgrafen Ludwig's Braufrudis** (1557), **Frauenlob** (1661), Le Capitif (1686)—instrumental music to dramas, notably to Goethe's Faust (1786), two symphonies and various choral works.

**Lasso** (Lassus), **Orlando** (c. 1530–1594), Belgian musical composer, whose real name was probably Roland Delattre, was born at Mons, in Hainault, probably not much earlier than 1532, the date given by the epitaph printed at the end of the volumes of the **Magnus opus musicum**; though already in the 16th century the opinions of his biographers were divided between the years 1520 and 1530. Much is reported, but very little known, of his connections and his early career. The discrepancy as to the date of his birth appears also in connexion with his appointment at the church of St John Lateran in Rome. If he was born in 1520 or 1532 he could not have obtained that appointment in 1541. What is certain is that his first book of madrigals was published in Venice in 1555, and that in the same year he speaks of himself in the preface of Italian and French songs and Latin motets as if he had recently come from Rome. He seems to have visited England in 1554 and to have been introduced to Cardinal Pole, to whom an adulatory motet appears in 1556. (This is not, as might hastily be supposed, a confusion resulting from the fact that the ambassador from Ferdinand, king of the Romans, Don Pedro de Lasso, attended the marriage of Philip and Mary in England in the same year.) His first book of motets appeared at Antwerp in 1556, containing the motet in honour of Cardinal Pole. The style of Orlando had already begun to purify itself from the secular and chansonnier elements seen in his early work; it seems to have known only his earlier works, to call him “a dwarf on stilts” as compared with Palestrina. But where he is orthodox he is as yet stiff, and his secular compositions are, so far, better than his more serious efforts.

In 1557, if not before, he was invited by Albrecht IV., duke of Bavaria, to go to Munich. The duke was a most intelligent patron of all the fine arts, a notableathlete, and a man of strict principles. Munich from henceforth never ceased to be Orlando’s home; though he sometimes paid long visits to Italy and France, whether in response to royal invitations or with projects of his own. In 1558 he made a very happy marriage by which he had four sons and two daughters. The four sons all became good musicians, and we owe an inestimable debt to the pious industry of the two eldest sons, who (under the patronage of Duke Maximilian I., the second successor of Orlando’s master) published the enormous collection of Orlando’s Latin motets known as the **Magnus opus musicum**.

Probably no composer has ever had more ideal circumstances for artistic inspiration and expression than had Orlando. His duty was to make music all day and every day, and to make it according to his own taste. Nothing was too good, too severe or too new for the duke. Church music was not more in demand than secular. Instrumental music, which in the 16th century had hardly any independent existence, accompanied the meals of the court; and Orlando would rise from dessert to sing trios and quartets with picked voices. The daily prayers included a full mass with polyphonic music. This amazing state of things becomes more intelligible and less alarming when we consider that 16th-century music was no sooner written than it could be performed. With such material as Orlando had at his disposal, musical performance was as unattended by expense and tedious preliminaries as a game of billiards in a good billiard room. The expert Haydn’s position at Esterhazy can have enabled him, as has been said, to “ring the bell” for musicians to come and try a new orchestral effect with such ease as that with which Orlando could produce his work at Munich. His fame soon became world-wide, and every contemporary authority is in—of the acclamation with which Orlando was greeted wherever his travels took him.

Very soon, with this rapid means of acquiring experience, Orlando’s style became as pure as Palestrina’s; while he always retained his originality and versatility. His relations to the literary culture of the time are intimate and fascinating; and during his stay at the court of France in 1571 he became a friend of the poet Ronsard. In 1579 Duke Albrecht died. Orlando’s salary had already been guaranteed to him for life, so that his outward circumstances did not change, and the new duke was very kind to him. But the loss of his master was a great grief and seems to have checked his activity for some time. In 1589, after the publication of six Masses, ending with a beautiful **Missa pro defunctis**, his strength began to fail; and a sudden serious illness left him alarmingly depressed and inactive until his death on the 14th of June 1594.

If Palestrina represents the supreme height attained by 16th-century music, Orlando represents the whole century. It is impossible to exaggerate the range and variety of his style, so long as we recognise the limits of 16th-century musical language. Even critics to whom this language is unfamiliar cannot fail to notice the glaring differences between Orlando’s numerous types of art, though such critics may believe all those types to be equally crude and archaic. The swiftness of Orlando’s intellectual and artistic development is astonishing. His first four volumes of madrigals show a very intermittent sense of beauty. Many a number in them is one compact mass of the fashionable harsh play upon the “false relation” between twin major and minor chords, which is usually believed to be the unenviable distinction of the English madrigal style from that of the Italians. It must be confessed that in the Italian madrigal (as distinguished from the villanella and other light forms), Orlando never attained complete certainty of touch, though some of his later madrigals are indeed glorious. But in his French chansons, many of which are settings of the poems of his friend Ronsard, his wit and lightness of touch are unfailling. In setting other French poems he is sometimes unfortunately most witty where the words are most gross, for he is as free from modern scruples as any of his Elizabethan contemporaries. In 1562, when the Council of Trent was censoring the abuses of Flemish church music, Orlando had already purified his ecclesiastical style; though he did not go so far as to Italianize it in order to oblige those modern critics who are unwilling to believe that anything appreciably unlike Palestrina can be legitimate. At the same time Orlando’s Masses are not among his greatest works. This is possibly partly due to the fact that the proportions of a musical Mass are at the mercy of the local practice of the liturgy; and that perhaps the uses of the court at Munich were not “quite so favourable to broadly designed proportion (not length) as the uses of Rome. Differences which might cramp the 16th-century composer need not amount to anything that would draw down the censure of ecclesiastical authorities. Be this as it may, Orlando’s other church music is always markedly different from Palestrina’s, and often fully as sublime. It is also in many ways far more modern in resource. We frequently come upon things like the **Justorum animae** [Magnus Opus, No. 260 (301)] which in their way are as overpoweringly touching as, for example, the Benedictus of Beethoven’s **Mass in D** or the soprano solo in Brahms’s **Deutsches Requiem**.

No one has approached Orlando in the ingenuity, quaintness and humour of his tone-painting. He sometimes descends to extremely elaborate musical puns, carrying farther than any other composer since the dark ages the absurd device of setting syllables that happened to coincide with the sol-fa system to the corresponding sol-fa notes. But in the most absurd of such cases he evidently enjoys twisting these notes into a theme of pregnant musical meaning. The quaintest instance is the motet **Quid estis putullones** [Magnus Opus, No. 92 (60)] where extra sol-fa syllables are introduced into the text to make a good theme in combination with the syllables already there by accident! (An excelsis tentativi U Soli [Fa Ma] Re Lasatus
habenas possit denuo cohibere?). The significance of these euphonic jokes is that they always make good music in Orlando’s hands.

There is musical fun even in his volume of parody of the stammering style of word-setting in the burlesque motet S. U. Su. P. E. R. p. e. r. f. L. U., which gets through one verse of a psalm in fifteen minutes.

When it was a question of purely musical high spirits Orlando was univalved; and his setting of Walter de Mape’s Fertur in convivis (given in the Magnum opus with a stupid moral derangement of the text), and most of his French chansons, are among the most deeply humorous music in the world.

But it is in the tests of the sublime that Orlando shows himself one of the greatest minds that ever found expression in art. Nothing sublime was too unfamiliar to frighten him into repressing his quaint fancy, though he early repressed all that thwarted his musical nature. His Penitential Psalms stand with Josquin’s Miserere and Palestrina’s Dialogus as artistic monuments of 16th-century penitential religion, just as Bach’s Matthew Passion stands alone among such monuments in later art. Yet the passage (quoted by Sir Hubert Parry in vol. 3 of the Oxford History of Music) of Orlando’s penitentiary verse is one among many traits which are ingenuously and grotesquely descriptive without losing harmony with the austere profundity of the huge works in which they occur. It is impossible to read any large quantity of Orlando’s mature music without feeling that a mind like his would in modern times have covered a wider field of mature art than any one classical or modern composer known to us. Yet we cannot say that anything has been lost by his belonging to the 16th century. His music, if only from its peculiar technique of crossing parts and unexpected intervals, is exceptionally difficult to read; and hence intelligent conducting and performance of it is rare. But its impressiveness is beyond dispute; and there are many things which, like the Jusiorum animae cannot even be read, much less heard, without emotion.

Orlando’s works as shown by the plan of Messrs. Breitkopf & Hartel’s complete critical edition (begun in 1894) comprise: (1) the Magnopus musicus, a posthumous collection containing Latin pieces for two to twelve voices, 516 in number (or, counting by single movements, over 700). Not all of these are to the original texts. The Magnopus fills eleven volumes. (2) Five volumes of madrigals containing six books, and a large number of single madrigals, and about half a volume of lighter Italian songs (villanelles, &c.). (3) Three volumes (not four as in the prospectus) of French Psalms and Masses from Orlando’s own volumes, passed for part Lieder. (5) Serial church music: three volumes, containing Lessons from the Book of Job (two settings). Passion according to St Matthew (i.e. like the Passions of Victoria and Soriano, a setting of the words of the crowds and of the discipies); Lamentations of Jeremiah; (6) a setting of the Canon of the Patroncinium (a publication suggested and supported by Orlando’s patrons and containing eight entire volumes of his works); the Seven Penitential Psalms; German Psalms and Propheciae Sibyllarum, (6) one hundred Magnificats (Judaeas by Virginia) 3 vols., (7) eight volumes of Masses, (8) two volumes of Latin songs not in the Magnopus, (9) five volumes of unpublished works. (D. F. T.)

LASSO (Span. lasso, snare, ultimately from Lat. laqusus, cf. “lace”), a rope 60 to 100 ft. in length with a slip-noose at one end, used in the Spanish and Portuguese parts of America and in the western United States for catching wild horses and cattle. It is employed in South America than in the vast grazing country west of the Mississippi river, where the herders, called locally cow-boys or cow-punchers, are provided with it. When not in use, the lasso, called rope in the West, is coiled at the right of the saddle in front of the rider. When an animal is to be caught the herder, galloping after it, swings the coiled lasso round his head and casts it straight forward in such a manner that the noose settles over the head or round the legs of the quarry, when it is speedily brought into submission. A shorter rope called lariat (Span. la reata) is used to picket horses.

LAST. 1. (A syncopated form of “latest,” the superlative of O.E. læt, late), an adjective applied to the conclusion of anything, all that remains after everything else has gone, or that which has just occurred. In theology the “four last things” denote the final scenes of Death, Judgment, Heaven and Hell; the “last day” means the Day of Judgment (see ESCHATOLOGY).

2. (O.E. læt, footstep; the word appears in many Teutonic languages, meaning foot, footstep, track, &c.; it is usually referred to a Teutonic root lais, cognate with Lat. lira, a furrow; from this root, used figuratively, came “learn” and “lore”), originally a footstep, trace or track, now only used of the model of a foot in wood on which a shoemaker makes boots and shoes; hence the proverb “let the cobbler stick to his last,” “ne stet ultra crepidam.”

3. (O.E. glæs; the work is connected with the root seen in “lade,” and is used in German and Dutch of a weight; it is also seen in “ballast”), a commercial weight or measure of quantity, varying according to the commodity and locality; originally applied to the load of goods carried by the boat or wagon used in carrying any particular commodity in any particular locality, it is now chiefly used as a weight for fish, a “last” of herrings being equal to from 10,000 to 12,000 fish. The German Last=4000 lb, and this is frequently taken as the nominal weight of an English “last.” A “last” of wool=12 sacks, and of beer=12 hogshead.

LASUS, Greek lyric poet, of Hermione in Argolis, flourished about 510 B.C. A member of the literary and artistic circle of the Peisistratide, he was the instructor of Pindar in music and poetry and the rival of Simonides. The dithyramb (of which he was sometimes considered the actual inventor) was developed by him, by the aid of various changes in music and rhythm, into an artistically constructed choral song, with an accompaniment of several flutes. It became more artificial and mimetic in character, and its range of subjects was no longer confined to the adventures of Dionysus. Lasus further increased its popularity by introducing prize contests for the best poem of the kind. His over-refinement is shown by his avoidance of the letter sigma (on account of its hissing sound) in several of his poems, of one of which (a hymn to Demeter of Hermione) a few lines have been preserved in Athenaeus (xiv. 624 E). Lasus was also the author of the first theoretical treatise on music.

Bode, Geschichte der hellenischen Dichtkunst, ii. pt. 2, p. 111; F. W. Schneidewin, De Lasio Hermionensi Comment. (Göttingen, 1842); Fragm. in Bergk, Poet. Lyr.

LAS VEGAS, a city and the county-seat of San Miguel county, New Mexico, U.S.A., in the north central part of New Mexico, on the Gallinas river, and 83 m. by rail E. of Santa Fé. Though usually designated as a single municipality, Las Vegas consists of two distinct corporations, the old town on the W. bank of the river and the city proper on the E. bank. Pop. of the city (1890) 2385; (1900) 3552 (340 being foreign-born and 116 negroes; 1910) 3755. According to local estimates, the combined population of the city and the old town in 1908 was 10,000. Las Vegas is served by the Atchison, Topeka & Santa Fé railway, and is its division headquarters in New Mexico. The city lies in a valley at the foot of the main range of the Rocky Mountains, and is about 6400 ft. above the sea. There are high peaks to the W. and within a short distance of the city much beautiful mountain scenery, especially along the “Scenic Route,” a highway from Las Vegas to Santa Fé, traversing the Las Vegas mountains. The climate of the city consists of level plains. The small amount of rainfall, the great elevation and the southern latitude give the region a dry and rarified air, and Las Vegas is a noted health resort. Six miles distant, and connected with the city by rail, are the Las Vegas Hot Springs. The old town on the W. bank of the Gallinas river retains many features of a Mexican village, with low adobe houses facing narrow and crooked streets. Its inhabitants are largely of Spanish-American descent. The part on the E. bank or city proper is thoroughly modern, with well-graded streets, many of them bordered with trees. The most important public institutions are the New Mexico insane asylum, the New Mexico normal university (chartered 1893, opened 1898), the county court house (in the old town), the academy of the Immaculate Conception, conducted by the Sisters of Loreto, St. Anthony’s.
sanatorium, maintained by the Sisters of Charity, La Salle institute, conducted by the Christian Brothers, a Presbyterian mission school and a Methodist manual training and commercial school. There are railway machine-shops, and various manuf actories. Las Vegas lies in the centre of an extensive grazing region, has large stockyards and annually ships great quantities of wool.

Three theatres are established in Spanish. Las Vegas was founded in 1835, under the government of the Mexican Republic. On the 15th of August 1846, during the war between Mexico and the United States, Gen. Stephen W. Kearny entered the town, and its alcalde took the oath of allegiance to the United States. There was but little progress or development until the arrival of the railway in 1879. In 1888 the part east of the river was incorporated as a town under the name of East Las Vegas, and in 1896 it was chartered as the city of Las Vegas. The old Las Vegas, west of the river, was incorporated as a town in 1903.

LASWARI, one of the decisive battles of India. It was fought on the 1st of November 1803 between the British under General Lake, and the Mahratta troops of Sindia, consisting of the remnant of Perron's battalions. Laswari is a village in the state of Mahratta, 8 m. S. of Deo. In the morning of the 1st of November, 1803, Perron's remnant, as it was called, attacked Lake and the enemy and attacked them with his cavalry before the infantry arrived. The result was indecisive, but when the infantry came up there ensued one of the most evenly contested battles ever fought between the British and the natives of India, which ended in a complete victory for the British.

LATAUNCUNA (LATACTUNGA, or, in local parlance, TACUNGA), a plateau town of Ecuador, capital of the province of Léon, 46 m. S. of Quito, near the confluence of the Alages and Cutuchi to form the Patate, the headstream of the Pastaza. Pop. (1900, estimate) 12,000, largely Indian. Latauncuna stands on the old road between Guayaquil and Quito and has a station on the railway between those cities. It is 9141 ft. above sea-level; and its climate is cold and unpleasant, owing to the winds from the neighbouring snow-capped heights, and the barren, pinkish to yellow-covered, table-land on which it stands. Cotopaxi is only 25 m. distant, and the town has suffered repeatedly from eruptions. Founded in 1534, it was four times destroyed by earthquakes between 1698 and 1798. The neighbouring ruins of an older native town are said to date from the Incas.

LA TAILLE, JEAN DE (c. 1540-1608), French poet and dramatist, was born at Bondaroy. He studied the humanities in Paris under Muret, and law at Orleans under Anne de Bourg. He began his career as a Huguenot, but afterwards adopted a mild Catholicism. He was wounded at the battle of Armay-le Duc in 1570, and retired to his estate at Bondaroy, where he wrote a political pamphlet entitled Histoire abrégée des singeries de la ligue, often published with the Sature Ménipée. His chief poem is a satire on the follies of court life, Le Courtois réist; he also wrote a political poem, Le Prince nécessaire. But his fame rests on his achievements in drama. In 1572 appeared the tragedy of Solil le fureux, with a preface on L'Art de la tragédie. Like Jodelle, Grèvin, La Pérusse and their followers, he wrote, not for the general public to which the mysteries and farces had addressed themselves, but for the limited audience of a lettered aristocracy. He therefore depreciated the native drama and insisted on the Senecan model. In his preface La Taille eulogiates the unities of place, time and action; he maintains that each act should have a unity of its own and that the scenes composing it should be continuous; he objects to deaths on the stage on the ground that the representation is unconvincing, and he requires as subject of the tragedy an incident really terrible, developed, if possible, by elaborate intrigue. He criticizes e.g., the subject of the sacrifice of Abraham, chosen by Théodore de Bèze for his tragedy (1554), as unsuitable because it pity an text for the local legend from the spectator without real causation. In Solil le fureux he did not completely carry out his own convictions he developed his principal character with great ability. A second tragedy, La Famine ou les Gabonistes (1573), is inferior in construction, but is redeemed by the character of Rizpah. He was also the author of two comedies, Le Négromant and Les Corriveau, both written apparently by 1562 but not published until 1573. Les Corriveau is remarkable for its colloquial prose dialogue, which foreshadows the excellence of later French comedy.

His brother, JACQUES DE LA TAILLE (1548-1552), composed a number of tragedies, of which La Mort de Doria and La Mort d'Alexandre (both published in 1573) are the chief. He is best known by his Manière de faire des vers en français comme en grec et en latin, an attempt to regulate French verse by quantity. He died of plague at the age of 20. His Poésies diverses were published in 1572.

The works of Jean de la Taille were edited by René de Maule (4 vols., 1878-1892). See also E. Faget, La Tragédie française au XVIe siècle (1883).

LATAKIA (anc. Laodicæa), the chief town of a sanjak in the Beirut vilayet of Syria, situated on the coast, opposite the island of Cyprus. The oldest name of the town, according to Philo Herennius, was Παύμα or Αὐκην αὐρη; it received that of Laodicæa (ad mare) from Seleucus Nicator, who founded it in honour of his mother as one of the four "sister" cities of the Syrian Tetrapolis (Antioch, Seleucia, Apamea, Laodicæa). It was called by the Romans Doria, after Doria, who became his Emperor, and took the name of Julia; and, though it suffered severely when the fugitive Dolabella stood his last siege within its walls (143 B.C.), Strabo describes it as a flourishing port, which supplied, from the vineyards on the mountains, the greater part of the wine imported to Alexandria. The town received the privileges of an Italian colony from Severus, for taking his part against Antioch in the struggle with Niger. Laodicæa was the seat of an ancient bishopric, and even had some claim to metropolitan rights. At the time of the crusades, "Liche," as Jacques de Vitré says it was popularly called, was a wealthy city. It fell to Tancrèd with Antioch in 1102, and was recovered by Saladin in 1188. A Christian settlement was afterwards permitted to establish itself in the town, and to protect itself by fortifications; but it was expelled by Sultan Kala'ün and the defences destroyed. By the 16th century Laodicæa had sunk very low; the revival in the beginning of the 17th was due to the new trade in tobacco. The town has several times been almost destroyed by earthquakes—in 1770, 1887 and 1822.

The people are chiefly employed in tobacco cultivation, silk and oil culture, poultry rearing and the sponge fishery. There is a large export of eggs to Alexandria; but the wealth of the place depends most on the famous "Latika" tobacco, grown in the plain behind the town and on the Ansarieh hills. There are three main varieties, of which the worst is dark in colour and strong in flavour; the best, grown in the districts of Diryus and Amamareh, is light and aromatic, and is exported mainly to Alexandria; but much goes also to Constantinople, Cyprus and direct to Europe. After the construction of a road through Jebel Ansarieh to Hamah, Latika drew a good deal of traffic from upper Syria; but the Hamah-Homs railway has now diverted much of this again. The products of the surrounding district, however, cause the town to increase steadily, and it is a regular port of call for the main Levantine lines of steamers. The only notable object of antiquity is a triumphal arch, probably of the early 3rd century, in the S.E. quarter of the modern town. Latika and its neighbourhood formerly produced a very beautiful type of rug, examples of which are highly prized.

LATEEN (the Anglicized form of Fr. latine, i.e. voile latine, Latin sail, so-called as the chief form of rig in the Mediterranean), a certain kind of triangular sail, having a long yard by which it is suspended to the mast. A "lateener" is a vessel rigged with a lateen sail and yard. This rig was formerly much used, and is still the typical sail of the felucca of the Mediterranean, and dhow of the Arabian Sea.

LA TÈNE (Lat. tenes, shelter), the site of a lake-dwelling at the north end of Lake Neuchâtel, between Marin and Pré-fargier. According to some, it was originally a Helvetic opidum; according to others, a Gallic commercial settlement. R. Forrer distinguishes an older semi-military, and a younger
civillian settlement, the former a Gallic customs station, the latter, which may be compared to the canabae of the Roman camps and the booths and terrains used by soldiers and sailors. He also considers the older station to have been, not as usually supposed, Helvetic, but pre- or proto-Helvetic, the character of which changed with the advance of the Helvetii into Switzerland (c. 110-100 B.C.). La Tène has given its name to a period of culture (c. 500 B.C.-A.D. 100), the phase of the Iron age succeeding the Hallstatt phase, not as being its starting-point, but because the finds are the best known of their kind. The latter are divided into early (c. 500-250 B.C.), middle (250-100 B.C.) and late (100 B.C.-A.D. 100), and chiefly belong to the middle period. They are mostly of iron, and consist of swords, spear-heads, axes, scythes and knives, which exhibit a remarkable agreement with the description of the weapons of the southern Celts given by Diodorus Siculus. There are also brooches, bronze kettles, torques, small bronze ear-rings with little glass pearls of various colours, belt-hooks and pins for fastening articles of clothing. The La Tène culture made its way through France across to England, where it has received the name of the late Celtic ; a remarkable find has been made at Felixstowe in Suffolk.

Reinecke, Zur Kenntnis der La Tène Denkmäler der Zone nordwärts der Alpen (Mainzer Festschrift, 1902); R. Forrer, Reallexikon der prähistorischen, ... Altertümern (1907), where many illustrations are given.

LATERAN COUNCILS, the ecclesiastical councils or synods held at Rome in the Lateran basilica which was dedicated to Christ under the title of Savior, and further called the basilica of Constantine or the church of John the Baptist. Rankling as a papal cathedral, this became a much-favoured place of assembly for ecclesiastical councils both in antiquity (313, 457) and more especially during the middle ages. Among these numerous synods the most important are those which the tradition of the Roman Catholic church has classed as ecumenical councils.

1. The first Lateran council (the ninth ecumenical) was opened by Pope Callixtus II. on the 18th of March 1123; its primary object being to confirm the concordat of Worms, and to close the remaining points of the Investiture Controversy. In addition to this, canons were enacted against simony and the marriage of priests; while resolutions were passed in favour of the crusaders, of pilgrims to Rome and in the interests of the truce of God. More than three hundred bishops are reported to have been present.

For the resolutions see Monuments Germaniae, Leges, iv., i. 574-576 (1893); Mansi, Collecta Conciliorum, xxi. p. 281 sq.; Hefele, Concilien geschichte, v. 378-384 (ed. 2, 1886).

2. The second Lateran, and tenth ecumenical, council was held by Pope Innocent II. in April 1139, and was attended by close on a thousand clerics. Its immediate task was to neutralize the after-effects of the schism, which had only been terminated in the previous year by the death of Anacletus II. (d. 25th January 1138). All concensions received at his hands were declared invalid, his adherents were deposed, and King Roger of Sicily was excommunicated. Arnold of Brescia, too, was removed from office and banished from Italy.

3. At the third Lateran council (eleventh ecumenical), which met in March 1179 under Pope Alexander III., the clergy present again numbered about one thousand. The council formed a sequel to the peace of Venice (1177), which marked the close of the struggle between the papacy and the emperor Frederick I. Barbarossa; its main object being to repair the direct or indirect injuries which the schism had inflicted on the life of the church and to display to Christendom the power of the see of Rome. Among the enactments of the council, the most important concerned the appointment to the papal throne (Canon 1), the electoral law of 1050 being supplemented by a further provision declaring a two-thirds majority to be requisite for the validity of the cardinals' choice. Of the participation of the Roman clergy and populace, or of the imperial ratification, there was no longer any question. Another resolution, of importance for the history of the treatment of heresy, was the canon which decreed that armed force should be employed against the Cathari in southern France, that their goods were liable to confiscation and their persons to enslavement by the princes, and that all who took up weapons against them should receive a two years' remission of their penance and be placed—like the crusaders—under the direct protection of the church.

4. The fourth Lateran council (twelfth ecumenical), convened by Pope Innocent III. in 1215, was the most brilliant and the most numerousy attended of all, and marks the culminating point of the papal claim to the right of declaration and control of the ecclesiastical and temporal power by the medieval papacy. Prelates assembled from every country in Christendom, and with them the deputies of numerous princes. The total included 412 bishops, with 800 priors and abbots, besides the representatives of absent prelates and a number of inferior clerics. The seventy decrees of the council begin with a confession of faith directed against the Cathari and Waldenses, which is significant if only for the mention of a transubstantiation of the elements in the Lord's Supper. A series of resolutions provided in detail for the organized suppression of heresy and for the institution of the episcopal inquisition (Canon 3). On every Christian, of either sex, arrived at years of discretion, the duty was imposed of confessing at least once annually and of receiving the Eucharist at least at Easter (Canon 21). Enactments were also passed touching procedure in the ecclesiastical courts, the creation of new monastic orders, appointments to offices in the church, marriage-law, conventual discipline, the veneration of relics, pilgrimages and intercourse with Jews and Saracens. Finally, a great crusade was resolved upon, to defray the expenses of which it was determined that the clergy should lay aside one-twentieth—the pope and the cardinals one-tenth—of their revenues for the next three years; while the crusaders were to be held free of all burdens during the period of their absence.

Resolutions, ap. Mansi, op. cit. xxii. 953 sq.; Hefele, Concilien geschichte, v. 872-905 (ed. 2). See also Innocent III.

5. The fifth Lateran council (eighteenth ecumenical) was convened by Pope Julius II. and continued by Leo X. It met from the 3rd of May 1512 to the 16th of March 1517, and was the last great council anterior to the Reformation. The change in the government of the church, the rival council of Pisa, the ecclesiastical and political dissensions within and without the council, and the lack of disinterestedness on the part of its members, all combined to frustrate the hopes which its convocation had awakened. Its resolutions comprised the rejection of the pragmatic sanction, the proclamation of the pope's superiority over the council, and the renewal of the bull Unam sanctam of Boniface VIII. The theory that it is possible for a thing to be theologically true and philosophically false, and the doctrine of the mortality of the human soul, were both repudiated; while a three years' tithe on all church property was set apart to provide funds for a war against the Turks.

LATERITE (Lat. later, a brick), in petrology, a red or brown superficial deposit of clay or earth which gathers on the surface of rocks and has been produced by their decomposition; it is very common in tropical regions. In consistency it is generally soft and friable, but hard masses, nodules and bands often occur in it. These are usually rich in iron. The superficial layers of laterite deposits are often indurated and smooth black or dark-brown crusts occur where the clays have long been exposed to a dry atmosphere; in other cases the soft clays are full of hard nodules, and in general the laterite is perforated by tubules, sometimes with veins of different composition and appearance from the main mass. The depth of the laterite beds varies up to 30 or 40 ft., the deeper layers often being soft when the surface is hard or stony; the transition to fresh, sound rock
LATH—LATHE

below may be very sudden. That laterite is merely rotten crystalline rock is proved by its often preserving the structures, veins and even the outlines of the minerals of the parent mass below; the felspars and other components of granite gneiss having evidently been converted in situ into a soft argillaceous material.

Laterite occurs in practically every tropical region of the earth, and is very abundant in Ceylon, India, Burma, Central and West Africa, Central America, &c. It is especially well developed where the underlying rock is crystalline and felspathic (as granite gneiss, yavite and diorite), but occurs also on basalts in the Deccan and in other places, and is found even on micaceous schist, sandstone and quartzite, though in such cases it tends to be much sandier than argillaceous. Many varieties have been recognized. In India a calcareous laterite with large concretionary blocks of carbonate of lime is called kankar (kankar), and has a high seasonal temperature. These laterites are subject to a hydraulic cement. In some districts (e.g. W. Indies) similar types of laterite have been called “puzzolana” and are also used as mortar and cement. Kankar is also known and worked in British East Africa. The clay called cabook in Ceylon is essentially a variety of laterite. Common laterite contains very little lime, and it seems that in districts where there have existed in the past heavy rainfalls that component may be dissolved away by the action of water, while kankar, or calcareous laterite, is formed in districts where there is a smaller rainfall. In India also a distinction is made between “high-level” and “low-level” laterites. The former are found at all elevations up to 5000 ft. and more, and are the products of the decomposition of rock in situ; they are often fine-grained and sometimes have a very well-marked concretionary structure. These laterites are subject to a hydraulic cement. In some districts, however, they are carried away to lower grounds forming transported or “low-level” laterites. The finer particles effect the transport away, while the sand is left behind and it builds up a large amount of heavy iron oxides. In such situations the laterites are sandy and ferruginous, with a smaller proportion of clay, and are not intimately connected with the rocks on which they lie. On steep slopes laterite also may creep or slip when soaked with rain, and if exposed in sections on roadsides or river banks has a banded appearance, the stratification being parallel to the surface of the ground.

Chemical and microscopic investigations show that laterite is not a clay like those which are so familiar in temperate regions; it does not consist of hydrous silicate of alumina, but it is a mechanical mixture of fine grains of quartz with much matter of different kind of iron-rich laterites. The latter are easily soluble in acid while clay is not, and after treating laterite with acids the alumina and iron leave the silica as a residue in the form of a compact mass. The aluminas seem to be combined with variable proportions of water, probably as the minerals hydrgallite, diaspor and gibbsite, while the iron occurs as goethite, turgite, limonite, haematite. As already remarked, there is a tendency for the superficial layers to become hard, probably by a loss of the water contained in these aluminous minerals. These chemical changes may be the cause of the frequent concretionary structure and veining in the laterite. The great abundance of alumina in some varieties of laterite is a consequence of the removal of the fine particles of gibbsite, &c., from the quartz by the action of a gentle currents of water. We may also point out as essential the chemical similarity between laterite and the iron oxides, which occur, for example, in the north of Ireland as red clay, and similar to the formations of Tertiary basalt. The bauxite is rich in alumina combined with water, and is used as an ore of aluminium. It is often very ferruginous. Similar deposits occur at Vogelsberg in Germany, and we may infer that the bauxite beds are layers of laterite produced by subaerial decomposition in the same manner as the thick laterite deposits which are now in course of formation in the plateau basalts of the Deccan in India.

The conditions under which laterite is formed include, first, a high rainfall; secondly, the presence only in tropical districts and in plains or mountains up to about 5000 ft. in height; secondly, a heavy rainfall, with well-marked alternation of wet and dry seasons.
to the ceiling. The *New English Dictionary* points out a possible source of the word in Dan. *lad*, meaning apparently a supporting framework, found in the name of the turning-lathe, *drejelad*, and also in *savelad*, saw-bench, *vaenlerad*, loom, &c. (2) One of five, formerly six, districts containing three or more hundreds, into which the county of Kent was divided. Though the division survives, it no longer serves any administrative purpose. It was formerly a judicial division, the court of the lathe being superior to that of the hundred. In this it differs from the rape (q.v.) of Sussex, which was a geographical rather than an administrative division. In O. Eng. the word was *laegd*, the origin of which is doubtful. The *New English Dictionary* considers it almost certainly identical with O. Norse *læd*, landed possessions, territory, with a possible association in meaning with such words as *leif*, court, *mōlēsēva*, attendance at a meeting or moot, or with Mod. Dan. *laegd*, a division of the country for military purposes.

**LATHROP, FRANCIS** (1849-1909), American artist, was born at sea, near the Hawaiian Islands, on the 22d of June 1849, being the great-grandson of Samuel Holden Parsons, and the son of George Alfred Lathrop (1819-1877), who for some time was United States consul at Honolulu. He was a pupil of T. C. Farrar (1838-1891) in New York, and studied at the Royal academy of Dresden. In 1870-1873 he was in England, studying under Ford Madox Brown and Burne-Jones, and working in the school of William Morris, where he devoted particular attention to stained glass. Returning to America in 1873, he became known as an illustrator, painted portraits, designed stained glass, and subsequently confined himself to decorative work. He designed the chancel of Trinity church, Boston, and decorated the interior of Bowdoin college chapel, at Brunswick, Maine, and several churches in New York. The Marquand memorial window, Princeton chapel, is an example of his work in stained glass. His latest work was a series of medallions for the building of the Hispanic-American society in New York. He was one of the founders of the Society of American Artists, and became an associate of the National Academy of Design, New York, of which also William L. Lathrop (b. 1859) an artist who is to be distinguished from him, became a member in 1907. He died at Woodcliff, New Jersey, on the 18th of October 1909.

His younger brother, *GEORGE PARSONS LATHROP* (1851-1908), born near Honolulu on the 25th of August 1851, took up literature as a profession. He was an assistant editor of the *Atlantic Monthly* in 1875-1877, and editor of the *Boston Courier* in 1877-1879. He was one of the founders (1883) of the American copyright league, was prominent in the movement for Roman Catholic summer schools, and wrote several novels, some verse and critical essays. He was the author of *A Study of Nathaniel Hawthorne* (1886), and edited the standard edition (Boston, 1883) of Hawthorne's works. In 1871 he married in London the second daughter of Nathaniel Hawthorne—Rose Hawthorne Lathrop (b. 1851). After her death Mrs Lathrop devoted herself entirely to charity. She was instrumental in establishing (1896) and subsequently conducted St Rose's free home for cancer in New York City. In 1900 she joined the Dominican order, taking the name of Mother Mary Alphonsa and becoming superior of the Dominican community of the third order; and she established in 1901 and subsequently conducted this order's Rosary Hill home (for cancerous patients) at Hawthorne, N.Y. She published a volume of poems (1888); *Memories of Hawthorne* (1897); and, with her husband, *A Story of Courage: Annals of the Georgetown Convent of the Visitation of the Blessed Virgin Mary* (1894).

**LATIMER, HUGH** (c. 1490-1555), English bishop, and one of the chief promoters of the Reformation in England, was born at Thurcaston, Leicestershire. He was the son of a yeoman, who rented a farm of three or four pounds by year at the uttermost. Of this farm he "tilled as much as kept half a dozen men," returning also grass for a hundred sheep and thirty cattle. The year of Latimer's birth is not definitely known. In the *Life* by Gilpin it is given as 1470, a palpable error, and possibly a misprint for 1490.¹ Foxe states that at "the age of fourteen years he was sent to the university of Cambridge," and as he was elected fellow of Clare in 1509, his year of entrance was in all likelihood 1505. Latimer himself also, in mentioning his conversion from Romanism about 1525, says that it took place after he was thirty years of age. According to Foxe, Latimer went to school "at the age of four or thereabout." The purpose of his parents was to train him up in the knowledge of all good literature," but his father "was as diligent to teach him to shoot as any other thing." As the yeomen of England were then in comparatively easy circumstances, the practice of sending their sons to the universities was quite usual; indeed Latimer mentions that in the reign of Edward VI., on account of the increase of rents, the universities had begun wonderfully to decay. He graduated B.A. in 1510 and M.A. in 1514. Before the latter date he had taken holy orders. While a student he was not unaccustomed "to make good cheer and be merry," but at the same time he was a punctilious observer of the minutest religious faith and as "thisinate a Papist as any in England." So keen was his opposition to the new learning that his oration on the occasion of taking his degree of bachelor of divinity was devoted to an attack on the opinions of Melanchthon. It was this sermon that determined his friend Thomas Bilney to go to Latimer's study, and ask him "for God's sake to hear his confession," the result being that "from that time forward he began to smell the word of God, and forsook the school doctors and such fooleries." Soon his discourses exercised a potent influence on learned and unlearned alike; and, although he restricted himself, as indeed was principally his custom through life, to the inculcation of practical righteousness, and the censure of clamant abuses, a rumour of his heretical tendencies reached the bishop of Ely, who resolved to become unexpectedly one of his audience. Latimer, on seeing him enter the church, boldly changed his theme to a portrayal of Christ as the pattern priest and bishop. The points of comparison were, of course, deeply distasteful to the prelate, who, though he professed his "obligations for the good admonition he had received," informed the preacher that he "smelt somewhat of the pan." Latimer was prohibited from preaching in the university or in any pulpits of the diocese, and on his occupying the pulpit of the Augustinian monastery, which enjoyed immunity from episcopal control, he was summoned to answer for his opinions before Wolsey, who, however, was so sensible of the value of such discourses that he gave him special licence to preach throughout England.

At this time Protestant opinions were being disseminated in England chiefly by the surreptitious circulation of the works of Wycliffe, and especially of his translations of the New Testament. The new leaven had begun to communicate its subtle influence to the universities, but was working chiefly in secret and even to a great extent unconsciously to those affected by it, for many were in profound ignorance of the ultimate tendency of their own opinions. This was perhaps, as regards England, the most marked difference in the discipline of the Reformation, both on this account and on account of the position in which Henry VIII. then stood related to it. In no small degree its ultimate fate seemed also to be placed in the hands of Latimer. In 1526 the imprudent zeal of Robert Barnes had resulted in an ignominious recantation, and in 1527 Bilney, Latimer's most trusted coadjutor, incurred the displeasure of Wolsey, and did humiliating penance for his offences. Latimer, however, besides possessing sagacity, quick insight into character, and a ready and formidable wit which thoroughly disconcerted and confused his opponents, had naturally a distaste for mere theological discussion, and the truths he was in the habit of inculcating could scarcely be controverted, although, as he stated them, they were diametrically contradictory of prevailing errors both in

¹The only reasons for assigning an earlier date are that he was commonly known as "old Hugh Latimer," and that Bernhe, his Swiss servant, states incidentally that he was "above three-score and seven years" in the reign of Edward VI. Bad health and anxieties probably made him look older than his years, but under Edward VI. his powers as an orator were in full vigour, and he was at his book winter and summer at two o'clock in the morning.
doctrines and practice. In December 1529 he preached his two "sermons on the cards," which awakened a turbulent controversy in the university, and his opponents, finding that they were unable to cope with the dexterity and keenness of his satire, would undoubtedly have succeeded in getting him silenced by force, had it not been reported to the king that Latimer "favoured his cause," that is, the cause of the divorce. While, therefore, both parties were imperatively commanded to refrain from further dispute, Latimer was invited to preach before Henry in the Lent of 1530. The king was so pleased with the sermon that after it "he did most familiarly talk with him in a gallery." Of the special regard which Henry seemed to have conceived for him Latimer took advantage to pen the famous letter on the free circulation of the Bible, an address remarkable, not only for what Froude justly calls "its almost unexampled grandeur," but for its striking repudiation of the aid of temporal weapons to defend the faith, "for God," he says, "will not have it defended by man's power, but by His Word only, in which He hath evermore defended it, and that by a way far above man's power and reason." Though the appeal was without effect on the immediate policy of Henry, he could not have been displeased with its tone, for shortly afterwards he appointed Latimer one of the royal chaplains. In times so "out of joint," Latimer soon became "weary of the court," and it was with a sense of relief that he accepted the living of West Kington, or West Kineton, Wiltshire, conferred on him by the king in 1531. Harassed by severe bodily ailments, encompassed by a raging tumult of religious conflict and persecution, and aware that the faint hopes of better times which seemed to gild the horizon of the future might be utterly darkened by a failure either in the constancy of his courage or in his discernment and discretion, he exerted his eloquence with unabating energy in the furtherance of the cause he had at heart. At last a sermon he was persuaded to preach in London exasperated John Stokesley, bishop of Durham, who was induced to furnish that fervent persecutor with an opportunity to overthrow the most dangerous champion of the new opinions. Biney, of whom Latimer wrote, "if such as he shall die evil, what shall become of me?" perished at the stake in the autumn of 1531, and in January following Latimer was summoned to answer before the bishops in the consistory. After a tedious and captious examination, he was in March brought before convocation, and, on refusing to subscribe certain articles, was excommunicated and imprisoned; but through the interference of the king he was finally released after he had voluntarily signed his acceptance of all the articles except two, and confessed that he had erred not only "in discretion but in doctrine." If in this confession he to some extent tampered with his conscience, there is every reason to believe that his culpable timidity was occasioned, not by personal fear, but by anxiety lest in the death he should bring to light of truth. After the consecration of Cranmer to the archbishopric of Canterbury in 1533 Latimer's position was completely altered. A commission appointed to inquire into the disturbances caused by his preaching in Bristol severely censured the conduct of his opponents; and, when the bishop prohibited him (from preaching in his diocese, he obtained from Cranmer a special licence to preach throughout the province of Canterbury. In 1534 Henry formally reappointed the authority of the pope, and from this time Latimer was the chief co-operator with Cranmer and Cromwell in advising the king regarding the series of legislative measures which rendered that repudiation complete and irrevocable.

It was, however, the preaching of Latimer more than the edicts of Henry that established the principles of the Reformation in the minds and hearts of the people; and from his preaching the movement received its chief colour and complexion. The sermons of Latimer possess a combination of qualities which constitute them unique examples of that species of literature. It is possible to learn from them more regarding the social and political condition of the period than perhaps from any other source, for they abound, not only in exposures of religious abuses, and of the prevailing corruptions of society, but in references to many varieties of social injustice and unwise customs, in racy sketches of character, and in vivid pictures of special features of the time, occasionally illustrated by interesting incidents in his own life. The homely terseness of his style, his abounding humour—rough, cheery and playful, but irresistible in its simplicity, and occasionally displaying sudden and dangerous barbs of satire—his avoidance of dogmatic subtleties, his noble advocacy of practical righteousness, his bold and open denunciation of the oppression practised by the powerful, his scathing diatribes against ecclesiastical hypocrisy, the transparent honesty of his fervent zeal, tempered by sagacious moderation—these are the qualities which not only rendered his influence so paramount in his lifetime, but have transmitted his memory to posterity as perhaps that of the one among his contemporaries most worthy of our interest and admiration.

In September 1535 Latimer was consecrated bishop of Worcester. While holding this office he was selected to officiate as preacher when the først. John Forest, whom he vainly endeavoured to move to submission, was burned at the stake for denying the royal supremacy. In 1539, being opposed to the "act of the six articles," Latimer resigned his bishopric, learning from Cromwell that this was the wish of the king. It would appear that on this point he was deceived, but as he now declined to accept the articles he was confined within the precincts of the palace of the bishop of Chichester. After the attainder of Cromwell little is known of Latimer until 1546, when, on account of his connexion with the preacher Edward Crome, he was summoned before the council at Greenwich, and committed to the Tower of London. Henry died before his final trial could take place, and the general pardon at the accession of Edward VI. procured him his liberty. He declined to resume his see, notwithstanding the special request of the Commons, but in January 1548 again began to preach, and very unlikely, having been in the habit of begging to listen to him both in London and in the country. Shortly after the accession of Mary in 1553 a summons was sent to Latimer to appear before the council at Westminster. Though he might have escaped by flight, and though he knew, as he质地ly remarked, that "Smithfield already groaned for him," he at once joyfully obeyed. The pursuivant, he said, was "a welcome messenger." The hardships of his imprisonment, and the long disputations at Oxford, told severely on his health, but he endured all with unbroken cheerfulness. On the 16th of October 1555 he and Ridley were led to the stake at Oxford. Never was man more free than Latimer from the taint of fanaticism or less dominated by "vainglory," but the motives which now inspired his courage not only placed him beyond the influence of fear, but enabled him to taste in dying an ineffable thrill of victorious achievement. Ridley he greeted with the words, "Two years hence!" It follows, or, a few more natural lines of shall this day light such a candle by God's grace in England (as I trust) shall never be put out." He "received the flame as it were embracing it. After he had stroked his face with his hands, and (as it were) bathed them a little in the fire, he soon died (as it appeared) with very little pain or none."

Two volumes of Latimer's sermons were published in 1549. A complete edition of his works, edited by G. E. Corrie for the Parker Society, was published in 1844-1845. His "Ploughers" and "Seven Sermons preached before Edward VI. were reprinted by E. Arber (1886). The chief contemporary authorities for his life are his own sermons, John Stow's "Chronicle" and Foxe's "Book of Martyrs." In addition to memoirs prefixed to editions of his sermons, there are lives of Latimer by R. Deemans (1868, new and revised ed. 1881), and by R. M. and A. J. Carlyle (1890). (T. F. H.)

LATINA, VIA, an ancient highroad of Italy, leading S.E. to Rome. It was probably one of the oldest of Roman roads, leading to the pass of Algidus, so important in the early military history of Rome; and it must have preceded the Via Appia as a route to Campania, inasmuch as the Latin colony at Cales was founded in 334 B.C. and must have been accessible from Rome by road, whereas the Via Appia was only made twenty-years later. It followed a far more natural line of communication, without the engineering difficulties which the Via Appia had to encounter. As a through route it no doubt
preceded the Via Labicana (see LABICANA, VIA), though the latter may have been preferred in later times. After their junction, the Via Latina continued to follow the valley of the Trenus (Sacco), following the line taken by the Hernican hill-towns, Anagnia, Ferentum, Frusino, &c. At Fregellae it crossed the Liris, and then passed through Aquinum and Casinum, both of them comparatively low-lying towns. It then entered the interval between the Apennines and the volcanic group of Rocca Monfina, and the original road, instead of traversing it, turned abruptly N.E. over the mountains to Venafro, thus giving a direct communication with the interior of Samnium by roads to Asernia and Telesia. In later times, however, there was in all probability a short cut by Rufrae along the line taken by the modern highroad and railway. The two lines rejoined near the present railway station of Calanello and the road ran to Teanum and Cales, and so to Casinum, where was the crossing of the Volturnus and the junction with the Via Appia. The distance from Rome to Casinum was 129 m. by the Via Appia, 135 m. by the old Via Latina through Venafro, 126 m. by the short cut by Rufrae. Considerable remains of the road exist in the neighbourhood of Rome; for the first 40 m., as far as Compitum Anagninum, it is not followed by any modern road; while farther on in its course it is in the main identical with the modern highroad.

See T. Ashby in Papers of the British School at Rome vi. t sq., v. 1 sq., April (T. Ashby).

LATINI—LATIN LANGUAGE

LATINI, BRUNETTO (c. 1310-c. 1394), Italian philosopher and scholar, was born in Florence, and belonged to the Guelph party. After the disaster of Montaperti he took refuge for some years (1261-1268) in France, but in 1269 returned to Tuscany and for some twenty years held successive high offices. Giovanni Villani says that "he was a great philosopher and a consummate master of rhetoric, not only in knowing how to speak well, but how to write well. . . . He both began and directed the growth of the Florentines, both in making them ready in speaking well and in knowing how to guide and direct our republic according to the rules of politics." He was the author of various works in prose and verse. While in France he wrote in French his prose Trésor, a summary of the encyclopedic knowledge of the day (translated into Italian as Trésoro by Bono Giamboni in the 15th century), and in Italian his poem Tesoretto, rhapsied couplets in heptasyllabic metre, a sort of abridgment put in allegorical form, the earliest Italian didactic verse. He is famous as the friend and counsellor of Dante (see Inferno, xxxv. 82-87).

For the Trésor see P. Chabvilly’s edition (1863); for the Tesoro, Gailer’s edition (1876); for the Tesoretto, B. Wiese’s study in Zweifiilte ital. Philologie, vii. See also the biographical and critical accounts of Brunetto Latini by Thoe Sundby (1884), and Marchesini (1887 and 1890).

LATIN LANGUAGE. 1. Earliest Records of its Area.—Latin was the language spoken in Rome and in the plain of Latium in the 6th or 7th century B.C.—the earliest period from which we have any contemporary record of its existence. But it is as yet impossible to determine either, on the one hand, whether the archaic inscription of Praeneste (see below), which is assigned with great probability to that epoch, represents exactly the language spoken in Rome; or, on the other, whether, after having been used in a larger area of the Italian peninsula, or even of the lands to the north and west, the same language may at that date have extended. In the 5th century B.C. we find its limits within the peninsula fixed on the north-west and south-west by Etruscan (see ETRURIA: LANGUAGE); on the east, south-east, and probably north and north-east, by Sabin (Sabine) dialects (of the Marsi, Paeldigni, Sammites, Sabini and Picenum, q.v.); but on the north we have no direct record of Sabine speech, nor of any non-Latinian tongue nearer than Tuder and Asculum or earlier than the 4th century B.C. (see UMBA, IGUVIUM, PICENUM). We know, however, both from tradition and from the archaeological data, that the Sabine tribes were in the 5th century B.C. migrating, or at least sending off swarms of their younger folk, farther and farther southward into the peninsula. Of the languages they were then displacing we have no explicit record save in the case of Etruscan in Campania, but it may be reasonably inferred from the evidence of place-names and tribal names, combined with that of the Faliscan inscriptions, that before the Sabine invasion some idiom, not remote from Latin, was spoken by the pre-Etruscan tribes down the length of the west coast (see FALISCI; VOLISCI; also ROMA: HISTORY; LIGURIA; SICULI).

2. Earliest Roman Inscriptions.—At Rome, at all events, it is clear from the unwavering voice of tradition that Latin was spoken from the beginning of the city. Of the earliest Latin inscriptions found in Rome which were known in 1909, the oldest, the so-called "Forum inscription," can hardly be referred with confidence to an earlier century than the 5th; the later, the well-known Duenos (= later Latin bonus) inscription, certainly belongs to the 4th; both of these are briefly described below (§§ 40, 41). At this date we have probably the period of the narrowest extension of Latin; non-Latin idiom were spoken in Etruria, Umbria, Picenum and in the Marsian and Volscian hills. But almost directly the area begins to expand again, and after the war with Pyrrhus the Roman arms had planted the language of Rome in her military colonies throughout the peninsula. When we come to the 3rd century b.c. the Latin inscriptions begin to be more numerous, and in them (e.g., the oldest epitaphs of the Scipio family) the language is very little removed from what it was in the time of Plautus.

3. The Italic Group of Languages.—For the characteristics and affinities of the dialects that have just been mentioned, see the article ITALIAN: Ancient Languages and Peoples, and the separate articles on the tribes. Here it is well to point out that the only one of these languages which is not akin to Latin is Etruscan; on the other hand, the only one very closely resembling Latin is Faliscan, which with it forms what we may call the Latinian dialect of the Italic group of the Indo-European family of languages. Since, however, we have a far more complete knowledge of Latin than of any other member of the Italic group, this is the most convenient place in which to state briefly the very little that can be said as yet to have been ascertained as to the general relations of Italic to its sister groups. Here, as in many kindred questions, the work of Paul Kretschmer of Vienna (Einleitung in die Geschichte der griechischen Sprache, Göttingen, 1896) marked an important epoch in the historical aspects of linguistic study, as the first scientific attempt to interpret critically the different kinds of evidence which the Indo-European language has been left in various parts of the world, but in phonology, morphology, and especially in their mutual borrowings, and to combine it with the non-linguistic data of tradition and archaeology. A certain number of the results so obtained have met with general acceptance and may be briefly treated here. It is, however, extremely dangerous to draw merely from linguistic kinship deductions as to racial identity, or even as to an original contiguity of habitation. Close resemblances in any two languages, especially those in their inner structure (morphology), may be due to identity of race, or to long neighbourhood in the earliest period of their development; but they may also be caused by temporary neighbourhood (for a longer or shorter period), brought about by migrations at a later epoch (or epochs). A particular change in sound or usage may be due to the influence of one language on another, without there being anything else in common.
LATIN LANGUAGE

European speech, in respect of their most significant differences, ranges itself thus:

(i.) Back-palatal and Velar Sounds.—In point of its treatment of the Indo-European back-palatal and velar sounds, it belongs to the western or centum group, the name of which is, of course, taken from Latin; that is to say, like German, Celtic and Greek, it did not distinguish palatais and velars, which in Latin, Germanic and Albanian have been converted into various types of sibilants (Ind.-Eur. *kmn̩lm̩ = Lat. centum, Gr. ἱσμος, ἰσμος, Eng.-head- (red), but Sans. Saim, Zend sain); but, on the other hand, in common with those of the western groups, and analogically the eastern, the Italian languages labialized the original velars (Ind.-Eur. *g̩d̩ = Lat. quad, Ocs. pod, Gr. ραθαίνω, Welsh phew, Eng. what, but Sans. k̩d̩, “who?”).

(ii.) Velar Aspirates.—Like Greek and Sanskrit, but in contrast to all the other groups (even to Zend and Armenian), the italic group largely preserves a distinction between the Nonasian med. *a̯s̯i̯p̯a̯s̯i̯ (Indo-European med. aspasiai and mēgās, 1902-1904), and Messapian, was confused with ð. The name for olive-oil, which spread with the use of this commodity from Greek (οἶνος) to Italic speakers and thence to the north, becoming by regular changes (see below) the Iteritian oil, and then, from the latter stages of Gothic and becoming altē, leaving its parent form to change further (not later than 100 B.C.) in Latin to oleum, is a particularly important example, because (a) of the chronological limits which are implied, however roughly, in the process just noted, and (b) of the closeness of association in time of the change of ð to ð with the earlier stages of the “sound-shifting” (of the Indo-European plosives and aspirates) in German; see Kretschmer, Einstell. p. 116, and the authorities cited.

(iii.) Indo-European ð.—With Greek and Celtic, Latin preserved the Indo-European ð, which in the more northerly groups (Germanic, Baltic, Finno-Ugric), ind. (Indo-Iranian), and Albanian, was confused with ð. The name for olive-oil, which spread with the use of this commodity from Greek (οἶνος) to Italic speakers and thence to the north, becoming by regular changes (see below) the Iteritian oil, and then, from the latter stages of Gothic and becoming altē, leaving its parent form to change further (not later than 100 B.C.) in Latin to oleum, is a particularly important example, because (a) of the chronological limits which are implied, however roughly, in the process just noted, and (b) of the closeness of association in time of the change of ð to ð with the earlier stages of the “sound-shifting” (of the Indo-European plosives and aspirates) in German; see Kretschmer, Einstell. p. 116, and the authorities cited.

(iv.) Accentuation.—One marked innovation common to the western groups as compared with what Greek and Sanskrit show to have been an earlier feature of the Indo-European parent speech was the development of a strong explosive (often called stress) accent. The syllable of which each word is composed is the history of Italic, Celtic, Lettish (probably, and at a still later period in Germanic, though at a period later than the beginning of the “sound-shifting.” This extinguished the complex system of Indo-European accentuation which was directly reflected in Sanskrit, and was itself replaced in Latin and Oscar by another system already mentioned, but not in Latin till it had produced marked effects upon the language (e.g. the degradation of the vowels in compounds as in cōnspic= anus, cōnspic=fus). This was due to a change of accentual change (first pointed out by Dieterich, Kuhn’s Zeitschrift, i., and later by Thurneysen, Revue critique, vi. 312, Römisches Museum, xliii. 340) needs and deserves to be more closely investigated.

The ethno-linguistic bearing of the distinction within Italy is considered in the articles Sabini and Volsci; but the wider questions which the facts suggest have as yet been only scantily discussed; see the references for the “Sequanian” dialect of Gallic (in the inscription of Colligny, whose language preserves g) in the article 105:

Language.

From these primitive affinities we must clearly distinguish the numerous words taken into Latin from the Celts of north Italy within the historic period; for these see especially an interesting study by Von zur Mist, De vocabulis Gallicis sine Transpadanis ὑπὸ Vergiliium (Leipzig dissertation, 1905).

6. Greek and Italic.—We have seen above (§ 4, i., ii., iii.) certain broad characteristics which the Greek and the Italic groups of language have in common. The old question of the degree of their affinity may be briefly noticed. There are deep-seated differences in morphology, phonology and vocabulary between the two languages—such as (a) the loss of the forms of the ablative in Greek and of the middle voice in Latin; (b) the decay of the fricatives (s, v, ð) in Greek and the cavalier treatment of the aspirates in Latin; and (c) the almost total discrepancy of the vocabularies of law and religion in the two languages—which altogether forbid the assumption that the two groups can ever have been completely identical after their first dialectic separation from the parent language. On the other hand, in the first early periods of that dialectic development in the Indo-European family, the precursors of Greek and Latin cannot have been separated by any very wide boundary. To this primitive neighbourhood may be referred such peculiarities as (a) the genitive plural feminine ending in -sδα (Gr. -ω), in later in various dialects -δω, -δυ, -δς, etc.; (b) the feminine gender of many nouns of the o-declension, cf. Gr. ἵλιξ, Lat. vacca “cow”; and (c) the participles passiva (though in

xxx. 224), who thus explained the use of the accusative pronouns with these "passive" forms in Celtic; Ir. -m-hes, "I am carried," literally "folk carry me"; Umb. prī ferat, literally signum feratur, though as prī is a neuter word (= Gr. προς) this example was not so clear. But with the results of Zimmer’s article, an Osc. inscription (Conway, Camb. Philol. Society’s Proceedings, 1890, p. 16, and Italic Dialects, p. 113) was discovered containing the phrase ultimānum (ultimānum) cōnsābar, “ultimānum cōnsābar,” which demonstrated the nature of the suffix in Italic also. This originally active meaning of the -s form (in the third person singular passive) is the cause of the remarkable fondness for the use of the passive in Italic groups, which itself is a result (although not a cause) of the *ultimānum cōnsābar (ultimānum instead of cōnsābar), which was naturally extended to all tenses of the passive (vestum est, &c.), so soon as its origin was forgotten. Fuller details of the development will be found in Conway, op. cit. p. 561, and authorities there cited (not much little is added by K. Brugmann, Kurse vergl. Gramm., 1904, p. 596).

(v.) Formation of the perfect passive from the -to- past participle, Lat. monūtis (est), &c., Ir. bt-e-the, “he was left,” ro-leigt, “he has been left.” In Latin the participle maintains its distinct adjectival character; in Irish (J. Strachan, Old Irish Paradigms, 1905, p. 50) it has sunk into a purely verbal form, just as the perfect participles in -us in Umbrian have been absorbed into the future perfect in -ust. (1901).)—from its imperfections or imperfect plural active with its second adjective character (1902-1904), and modern Irish and Scotch Mac as in MacPherson and Brythonic (Britanic) (Welsh pump “five,” Ap for maus, as in Fowol for Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇua; Ap Ḇu
each case the forms differ widely in the two groups), and perhaps (f) of the dependent moods (though here again the forms have been very ingeniously reshaped in Italic). These syntactic parallels, which are hardly noticed by Kretschmer in his otherwise careful discussion (Einl., p. 155 seq.), serve to confirm his general conclusion which has been here adopted; because syntactic peculiarities have a long life and may survive not merely complete revolutions in morphology, but even a complete change in the speaker’s language, e.g. such Celtisms in Irish-English as “What are you after doing?” for “What have you done?” or in Welsh-English as “whatever” for “anything.” A few isolated correspondences in vocabulary, as in remus from rest in, with ēre andus and in a few plant-names (e.g. phakoo and porrum), cannot disturb the general conclusion, though no doubt they have some historical significance, if it could be determined.

7. Indo-Iranian and Italo-Celtic.—Only a brief reference can here be made to the striking list of resemblances between the Indo-Iranian and Italo-Celtic groups, especially in vocabulary, which Kretschmer has collected (ibid. pp. 120-144). The most striking of these are rēs, Q. Ir. rēs, Sans. rāṣ, and the political meaning of the same root to the corresponding verb in both languages (contrast regere with the merely physical meaning of Gr. ἰσῴρευω; Lat. rēs men (for reg-ment) exactly = Sans. brahm- (neuter), meaning probably “sacrificing,” “worshiping,” and then “priesthood,” “priest,” from the Ind.-Eur. root *bhēgh-, “blaze,” “make to blaze”; rēs, rem exactly = Sans. rāṣ, rāṃ in declension and especially in meaning; and Ārio-, “noble,” in Galic Arianmanus, &c., = Sans. ayā, “noble” (whence “Aryan”). So arguetīnī exactly = Sans. rājatā, Zend eresata; contrast the different (though morphologically kindred) suffix in Gr. ἰσῴρευω. Some forty-two other Latin or Celtic words (among them ērō, córēs, prōbōs, castus (cf. Osc. kastis, Lat. cord; Volsin, Néptūnas, ensis, erus, prōna, rēs, novācoda) have precise Sanskrit or Iranian equivalents, and none so near in any other of the eight groups of languages. Finally the use of an r suffix in the third plural is common to both Italo-Celtic (see above) and Indo-Iranian. These things clearly point to a fairly close, and probably pre-political, intercourse between the two communities of speakers at some early epoch. A shorter, interesting, list of correspondences in vocabulary with Balto-Slavonic (e.g. the words mešetī, rūs, ignīs have close equivalents in Balto-Slavonic) suggests that at the same period the precursor of this dialect too was a not remote neighbour.

8. Date of the Separation of the Italic Group.—The date at which the Italic group of languages began to have (so far as it had at all) a separate development of its own is at present only a matter of conjecture. But the combination of archaeological and linguistic research which has already begun can have no more interesting object than the approximate determination of this date (or group of dates); for it will give us a point of cardinal importance in the early history of Europe. The only consideration which can here be offered as a starting-point for the inquiry is the chronological relation of the Etruscan invasion, which has been tentatively fixed to the 21st century B.C. (see Exon), to the two strata of Ind-European influences—Etruscan and -CO- (Failsi, Marruci, Volsi, Hernici, and others), to whom the Tuscan invaders owe the names Etrusci and Tusci, and the -NO- folk, who, on the West coast, in the centre and south of Italy, appear at a distinctly later epoch, in some places (as in the Bruttian peninsula, see Brutt) only at the beginning of our historical record. If the view of Latin as mainly the tongue of the -CO- folk prove to be correct (see Rome; History; Italian: Ancient Languages and Peoples; Sabin; Volsi) we must regard it (a) as the southern or earlier half of the Italic group, firmly rooted in Italy in the 12th century B.C., but (b) by no means yet isolated from contact with the northern or later half; such is at least the suggestion of the striking peculiarities in morphology which it shares with not merely Etruscan and Umbrian, but also, as we have seen, with Celtic. The progress in time of this isolation ought before long to be traced with some approach to certainty.

9. The History of Latin—We may now proceed to notice the chief changes that arose in Latin after the (more or less) complete separation of the Italic group whenever it came about. The contrasted features of Oscan and Umbrian, to some of which, for special occasional reasons, the other main language forms are fully described under Osca lingua and Iugum respectively.

It is rarely possible to fix with any precision the date at which a particular change began or was completed, and the most serviceable form for this prospectus of the development will be to present, under the heads of Phonology, Morphology and Syntax, the chief characteristics of Ciceronian Latin which we know to have been developed after Latin became a separate language. Which of these changes, if any, can be assigned to a particular period will be seen as we proceed. But it should be remembered that an enormous increase of exact knowledge has accrued from the scientific methods of research introduced by A. Leskien and K. Brugmann in 1879, and finally established by Brugmann’s great Grundriss in 1886, and that only a brief enumeration can here be attempted. For adequate study reference must be made to the fuller treatises quoted, and especially to the sections bearing on Latin in K. Brugmann’s Kurze vergleichende Grammatik (1922).

I. Phonology

10. The Latin Accent.—It will be convenient to begin with some account of the most important of the results of scientific method to the study of Latin, for, though it is not a part of phonology, it is wrapped up with much of the development both of the sounds and, by consequence, of the inflections. The phonetic changes have largely been completed (§ 4, § 4, above) so that the restriction of the word-accent in Latin to the last three syllables of the word, and its attachment to a long syllable in the penultimate, were certainly not its earliest traceable condition; between this, the classical and archaic, and the comparative freedom with which the word-accent was placed in some monosyllabic Indo-European, there had intervened a period of first-syllable accentuation to which we are mostly the characteristic contractions of Oscan and Umbrian, and in Latin the regularization of the vowels in such forms as accenturus from ad + -canus or praeceptum from a + -ceptum (cf. Kretschmer 1886, i. p. 594) pointed out that in Oscan also, by the 3rd century B.C., this first-syllable-accent had probably given way to a system which limited the word-accent in some way as in classical Latin. But it remained for C. Exon, in a brilliant article (Her曲折a (1906), xiv. 117, seq.), to deduce from the more precise stages of the change (which had been gradually postulated, e.g. by F. Skutsch in Kroll’s Altertumswissenschaft in sieben Vorlesungen, 1905) this actual effect on the language.

11. Accent in Time of Plautus.—The rules which have been established for the position of the accent in the time of Plautus are these:—

(i.) The quantity of the final syllable had no effect on accent.

(ii.) If the penultimate was long, it bore the accent (amō-dōmenus).

(iii.) If the penultimate was short, then

(a) if the ante-penultimate was long, it bore the accent (amō-dōmenus);
(b) if the ante-penultimate was short, it bore the accent (amō-dōmenus).

(i) If the ante-ante-penultimate was long, the accent was on the ante-penultimate (amō-dēmīus);
(ii) If the ante-ante-penultimate was also short, it bore the accent (amō-dōmenus). Exon’s Laws of Syncope.—With these facts are now linked what may be called Exon’s Laws, viz.:—

In pre-Platinean Latin in all words or word-groups of four or more syllables, the short syllable in the second or second to last syllable, a short unaccented medial vowel was sincopated; thus the unaccented vowel of a quindecem became quindecem and thence quindecim (for the -mn see § 19); supersemere became *supersemere and that semere (on -smn -v. inf.) became semere, supersace was made to surcosce and surcosma, and the rest of the paradigm followed; such forms always (if it is not already validated) meant *supersemere and *supersemere; a short vowel in a stem came to mean *supersemere (the form is therefore *supersemere in the paradigms). But the influence of cognitive forms often interferes; postternum became postternum, postteratum the short syllable was restored by the influence of the tri-syllabic cases, posterus, posterē, &c., to which the law did not apply. Conversely, the form *amīdēre became amēdēre from *amīdēre, and the like.

The same change produced the monosyllabic forms nec, ac, ne, se, from necque, &c., before consonants, since they had no accent of their own, but were always pronounced in one breath with the following word, neque tūnam becoming nec tūnam, and the like. So in Plautus (and probably always in spoken Latin) the forms nemēp(e), ind(e), gūpp(e), il(e), are regularly monosyllables.
12. Syncop of Final Syllables.—It is possible that the frequent but far from universal syncope of final syllables in Latin (especially before consonants) as in minimus, which represents both Gr. μικρός and Sans. mārtīs = Ind.-Eur. mārtīs, mind) is due also to syncopating on such combinations as bona mónis and the like, but this has yet been clearly shown. In any case the effects of any such phonetic change are not very greatly modified by analogical changes. The Latin and Umbrian syncope when it occurred before final s was working the outbreak of the unconscious affixion of slurring final syllables may have been contemporaneous.

13. In post-Latin Latin words accent on the ante-ante-penult.— (i.) In the short syllable following the accented syllable (conjugatio, e.g. bone, house as became bōnē, prāstria became prāstria (Horace), cōlumina, tēgima, ligamenta, colomina, tēgīmen, &c., beside the trisyllabic caulem, tigēmen) unless
     (ii.) that short vowel was e or i, followed by another vowel (as in pāaraterēm, Pāarētīs), when, instead of contraction, the accent shifted to the penult, which in later stages of the language became lengthened, pāarētīdum giving Ital. parērē, Fr. parāi, Pāarētīs giving Ital. Pozzulī.

The restriction of the accent to the last three syllables was completed by these changes, which did away with all the cases in which it had stood on the fourth syllable.

14. The Law of the Brevis Brevis.—Next must be mentioned two other great phonetic changes, also dependent upon accent, which had come from the reduction of bēnēs, the law long known to students as the Brevis Brevis, which may be stated thus:—

(Exon, Germahiena (1902), xii. 491, following Skutsch in, e.g., Exon's Jahrbucher für romanische Sprachwissenschaft, i. 331), a syllable following e or i (and preceded by a short syllable, was itself shortened if the vowel were accented before or immediately after it)—that is, on the preceding short syllable or on the next following syllable. The sequence of syllables was closed off in its entirety, and hence became closely connected in utterance as if it were. Thus nēbī became nēbī, pāephelātīs became pāephelātī, quāmētīs became quāmētī either the s or the t both being faintly pronounced.

It is clear that the larger number of flexional syllables so shortened would have their quantity immediately restored by the accent, the same inflexion occurring in words not of this particular shape; thus, for instance, the long vowel of pāmphē, and the like is due to that in all, and in a, the first syllable of pāmphē and the like, the same kind of change would have come about if the same words had been accented on the second syllable, and in the form of pāmphē, pāmphē, pāmphē, pāmphē and the like. And the accent is at least as a rule not in the cases where the syllable has been made two syllables in length.

15. Effect on Verb Inflection.—These changes had far-reaching effects on Latin inflection. The object of these was the creation of the so-called Ambh-Gr. ἀμβρός, the law long known to students as the Brevis Brevis, which may be stated thus:—

(i.) Had become e when followed by sound save t, r, or l, as in
evōli, tēlō; beside ecolo beside Gr. οὐκολος, οὐκολος, Att. ἐκτός; colōnus for *culōnus, beside inquinus for *en-quinus.

(iv.) e became i (i.) before a nasal followed by a palatal or velar consonant (leng., Gr. ἐπίνυμον, -σηνυμον from *en-γινυμον); (ii.) under certain conditions not yet precisely defined, one of which was i in the following syllable (nī, i, nisi, initium). From these forms developed a change in the earlier form.

(v.) The "neutrino" (Gr. neutrino-Germanism) which arose in Indo-European from the reduction of long a, e, or o in unaccented syllables (as in the -ūs particles of such roots as *dēs[t]ā, *dēs[t]ā, *dēs[t]ā, *dēs[t]ā, *dēs[t]ā) became a in Latin (status con-ditus [from *conditus], datum, datuu) and was the same sound which is represented by a in most of the forms of dōs (damō, dābī, vī, tī, nī, ré, stī, nī, ré).

(vi.) When a long vowel came to stand before another vowel in the same word through loss of i or g, it was always shortened; thus the -īd of intrusive verbs like canedī is for -īdī (where the e is identical with the i in Gr. ἀκανθ, ἱκανθ) and was thus confused with the causative -eīd (as in moēnē, I make to think," &c.), where e is original. So audītī became ausītī and thence audītī (the form audītus would have been slighted altogether but for being restored from audīvīrī, &c.; conversely, praesens is formed from audītī).

16. Changes of Accent.—Some cases of the loss of accent which has occurred in the nominative singular are of interest in Latin.

17. Vowel Changes independent of Accent.—In the former category the following are the most important changes:

(i.) Became ê when final, as in ant-ē beside Gr. ἄντε, triste beside Gr. ἄντε, triste beside Gr. ἄντε, &c., the Greek neuter tooth (the final -ε of the inflexive—regere, &c.—lost its content) can be interpreted, non-phonetic theory cannot be discussed here. See the article cited and also F. Skutsch, Forschungen zur Latein. Grammatik und Metrik, i. (1893) xii. 491, following Skutsch in, e.g., Exon's Jahrbucher für romanische Sprachwissenschaft, i. 331), xii. 492, W. M. Lindsay, Captivō, (1903), appendix.

In the history of the vowels and diphthongs in Latin we may distinguish the changes which came about independently of accent and those produced by the accent. The first is the change of accent in another syllable.

17. Vowel Changes independent of Accent.—In the former category the following are the most important changes:

(i.) Became ê when final, as in ant-ē beside Gr. ἄντε, triste beside Gr. ἄντε, triste beside Gr. ἄντε, &c., the Greek neuter tooth (the final -ε of the inflexive—regere, &c.—lost its content) can be interpreted, non-phonetic theory cannot be discussed here. See the article cited and also F. Skutsch, Forschungen zur Latein. Grammatik und Metrik, i. (1893) xii. 491, following Skutsch in, e.g., Exon's Jahrbucher für romanische Sprachwissenschaft, i. 331), xii. 492, W. M. Lindsay, Captivō, (1903), appendix.

In the history of the vowels and diphthongs in Latin we may distinguish the changes which came about independently of accent and those produced by the accent. The first is the change of accent in another syllable.

17. Vowel Changes independent of Accent.—In the former category the following are the most important changes:

In the history of the vowels and diphthongs in Latin we may distinguish the changes which came about independently of accent and those produced by the accent. The first is the change of accent in another syllable.
LATIN LANGUAGE

248

feminine ēris was restored in Latin (though not in North Ocean) by the analogy of other adjectives, like tristis, while the masculine āser was protected by the parallel masculine forms of the -o declension, like tener, niger [from *tenero, *nigro*].

Long vowels generally remained unchanged, as in compāgo, condōnō.

22. Of the diphthongs, ai and ei both sank to e, and with original ei further to i, in unaccented syllables, as in Āchīri from Gr. *Άχις*, a shortened form (see also *āchōs, *vēi*). Conversely, the form *ēi* from the unaccented *ē* of Gr. *έως* is preserved in Latin *ēnum* (cf.GREEK). This gives us interesting chronological data, since the -el must have changed to ol (§16.3) before the change of -ai to -e in, and that before the change of the accent from the syllable of the preceding Gr. word to the syllable of the next Latin word, as taking place after -āt, -ēn, -ōn. Before -ebam had become -ēnum, as it regularly did before the time of Plautus.

But cases of ai, ai, which arose later than the change to e, i, were unaffected by it; thus the nomin. plur. of the first declension originally *ātēs* (Gr. ΄άτη) became in Latin -ētae (an Ocean form), but was changed to -ētae before Plautus to -ē from the influence of the nominative plur. Sans. *ātā*; *ātā* (which was accentuated after Plautus).

23. Consonant i (wrongly written j; there is no g-sound in the letter), conveniently written j by phoneticians, (i) was lost between vowels, as in grēs for *trigres*, &c. (§17.6); (ii) became a from *ātēs* to *ātēs* before *ē* - as in mātēs; *mātēs*; but in the declension *Hermathena* (1895), xiii. 555; K. Brugmann, Grundriss, 1st ed. ii. 571, 601.

The diphthongs au, ou in unaccented syllables sank to -as, -as in incipit (cf. claudō): the form clādō, taken from the compound claudō after Cicero's time. So clādō, taken from incādō, excābō, banished the older *caudo*, "I cut, strike," with which is probably connected caudo, "the striking member, tool," which shows as a cause, "a cutting, decision, legal case," whose *ss* shows that it is derived from a root ending in a dental (see §25 below and Conway, Verner's Law in Italy, in p. 72.

Consobriturus. —Passing now to the chief changes of the consonants we must notice the changes of *p*, *t*, *q*, *k*, *s*.

24. Consonant n (formerly represented by English v), conveniently written n, (i) was lost between similar vowels when the first was accepted, as in audātī, which became audītī (§17.6), but not in aŭdītī, nor in aŭdītas.

In combination: dg- became b, as in bonus, bēllum, O. Lat. dōnum, *adērum* (though the poets finding this written form in old literary sources treated it as trisyllabic): ps-, ἰς-, ὑς-, lost the ὕ before *α-τερο* ἰάτερο beside Lith. -er, "I open, Open, ϑερεν, and in the gerundive stem -erundus, erūs, probably for -erōnges, as in other languages, whence also the Sanskrit *prṣrds*; erāns; ἵς-, as in mātōr from *mātō-gar, pēstō; from *ped-īrō*:

(iii) otherwise e after a consonant became generally syllabic (-i-), as in capō (trisyllabic) beside Goth. hafna.

25. (a) Latin s (i) became r between vowels between 450 and 350 B.C. (for the date see R. S. Conway, Verner's Law in Italy, pp. 61-64), as in àrō, besides Gr. *άρο*; *άρος*; (see also *gēnesis, Gr. γένος; eráns, erō for *ēstām, estā*), and in the verbal infinitive and the gerunds, a considerable number of words came into Latin, partly from neighboring dialects, with -s- between vowels, after 350 B.C., when the change ceased, and so show -s, as sārō (probably from S. Oc. *ku-šār*): but in the present day this form is generally preserved, beside Gr. *μησάρα* (probably also borrowed from south Italy), and many more, especially the participles in -sus (*fusus*), where the s- was at the time of the change of -s- to -r- (so in sāris, Latin *farris*). Hence even in Latin and the damaged (but not preserved) texts, otherwise it is said to have had failed (e.g. the theory of accentual difference in Verner's Law in Italy, or that of dissimilation, given by Brugmann, Kurse vorg. Gram. p. 242).

(b) Latin s was not a ten-voiced diphthong in pre-Italic, and this became initially br as in frigus, Gr. γρήγος (Ind.-Eur. *śrigos*), but mediately -br as in fēbrēs, from fēmis, stem fēnus.
II. PHILOLOGY

In morphology the following are the most characteristic Latin innovations:—

29. In nouns.

(ii.) The complete loss of the dual number, save for a survival in the dialect of Praeneste (C.I.L. xiv. 2861=, Conway, Ital. Dial. p. 258, where q. b. castio q. f., seems to be nom. dual); so C.I.L. xi. 6706, T. C. Vomano, see W. Schulze, Lat. Eigennamen, p. 117.

(iii.) The development of the so-called fifth declension by a re-adjustment of the declension of the nouns formed with the suffix -ia (which appears, for instance, in all the Greek feminine participles, and in a more abstract sense in words like dieretics) to the inflection of the gen. sing. and nom. and acc. plural. Thus as said 300 B.C. the inflexions probably were:

<table>
<thead>
<tr>
<th>Nom. plur.</th>
<th>vocat.</th>
</tr>
</thead>
<tbody>
<tr>
<td>conson. stem</td>
<td>-i stem</td>
</tr>
</tbody>
</table>

The confusing difference of signification of the long -tis ending led to a levelling of these and other forms in the two paradigms.

(iv.) The loss of the u decension (Gr. θτίος, θτυάς) in adjective forms in Latin, thanks to its feminine form (Sans. fem. sozā: "sweet") was transferred to the i decension (tsās, grau, levis, dulcis).

30. In verbs.

(i.) The long -vating ending which was used for the third person singular and plural respectively in all tenses and moods of the active. This change was completed after the archaic period by the fusion of the neuter singular and plural with the reflexive, third person singular past of tenses, e.g. deid, fecit, in place of the later deidē, fecit; and since in Octian the distinction was preserved to the end, both in singular and plural, e.g. faemata (perhaps meaning "adult"") (Wg. 325), which is commonly assumed from the evidence of Greek and Sanskrit (Gr. θτιον, Sans. aṣā), that the the primary endings in Latin have lost a final -i, partly or wholly by some phonetic change.

(ii.) The true thematic conjugation is almost wholly lost, surviving only in a few common usages, e.g. mist "vati, "willa" &c.

(iii.) The complete fusion of the aorist and perfect forms, and in the active voice only of imperfect and middle endings; thus the same ending attached; this is a true perfect: dixit, earlier *diti, is a true perfect: dixit is an aorist active; dixisti is a conflation of perfect and aorist with a middle personal ending.

(iv.) The development of perfects in -a- and -i-, derived partly from the aorists of roots ending in -v or -v, e.g. nōtī, nōti, for the origin of montān see Exon, Herculaneum (1901), xi. 356 sqq.

(v.) The complete fusion of conjunctive and optative into a single mood, the subjunctive: régem, &c., are conjunctive forms, whereas reserim, resišesem are certainly and regem most probably optative; the origin of amem and the like is still doubtful. Notice, however, that true conjunctive forms were often used as futures, régēt, regi, &c., and also the simple thematic conjunctive forms in like erō, resēt, &c.

(vi.) We have already noticed the rise of the passive in -(§ 5 (4)).

31. The use of the participles in the Latin language, especially (a) the nominative and (b) ablative absolute, which are still very prevalent in Latin.

32. Future Passive.—Finally may be mentioned together (a) the development of the Latin participle active (in -ārīus, never so strongly used as the other participles, being rare in ablative absolute even in Tacitus) from an old infinitive in -ı̆rūm ("sci inimicos meos hoc dicūtem""); C. Graccinus (and others) supd Cell. 1. 7, and Priscian in the first volume of his Latin grammar (1901), which arose from combining the dative or locative of the verbal noun in -ā in an old infinitive esōm "esse" which survives in Octian, *dicit esōm becoming dicētūrum. This was discovered by J. P. Postgate (Class. Review, v. 301, and Idg. xiv. 225). It is assumed from the postposition -ādō, meaning "to," "for," "in," (cf. quanto for "quandō, and Eng. to, Germ. zu") was formed the so-called gerund agen-ādō, "for doing," which was taken for a Case, and which we now use as an adjective.

The accusative in -ādō is also used in Latin, as in the English translation (by Conway and Rous, Strasbourg, 1890-1896) is divided into volumes ii, iii, and iv; and that Niedermann does not deal with morphology.

III. SYNTAX

The chief innovations of syntax developed in Latin may now be briefly noted.

In the case of nouns.

(i.) Latin restricted the various Cases to more sharply defined uses than either Greek or Sanskrit: the free use of the internal accusative in Greek (e.g. ἐδίδον βαλέω, ῥεχόμαι ῥέα) is strange to Latin, save in poetical imitations of Greek; and so is the freedom of the Sanskrit nominative and the accusative, which often covers meanings expressed in Latin by cum, ab, isīrem.

(ii.) The synchronism of the so-called ablative case, which combines the uses of (a) the true ablative which ended in -ā (O. Lat. prāvā); (b) the adverbial case of a spatial position; (c) the nominative and (d) the genitive case (being that of Sans. śīrā); and (e) the locative (nācē, "at night," tinētē, "on the road," with the ending of Greek ταχεῖα). The so-called absolute construction is mainly derived from the second of these, and is used to express the truth of the clause in which it stands, and when accompanied by a participial participle most commonly denotes an action that is past, but that the other two sources are not altogether excluded: "starting from here," "in the open plain".

34. In verbs.

(i.) The rich development and fine discrimination of the uses of the subjunctive mood, especially (a) in indirect questions (based on
This is equally true whatever was the precise nature of the sound which at that period the Greek aspirates had reached in their secular process of change from pure aspirates (as in Eng. anti-hill, &c.) to fricatives (like Eng. th in thin). (See Arnold and Conway, The Restored Pronunciation of Greek and Latin, 4th ed., Cambridge, 1908, p. 21.)

(d) A fourth stage is marked by the practice of the Augustan poets, who, especially when writing in imitation of Greek originals, replaced the aspirate by a voiced aspirate, /β/. This, according to A. G. Agüdá, Echás, &c. Horace probably always used the Latin form in his Satires and Epistles, the Greek in his Odes. Later prose writers for the most part followed the example of his Odes. It must be added, however, in regard to these literary borrowings that it is not quite certain whether the unmodified forms in the preceding class, the words had really any living use in spoken Latin.

V. PRONUNCIATION

This appears the proper place for a rapid survey of the pronunciation of the Latin language, as spoken in its best days. The classical pronunciation, as stated by Buck’s Balineum, lat.Decl., Vol. ii. (Cambridge, 1878-79), ii. (Cambridge, 1878-79), and the nasals as in Greek. To proceed in this fourth class, whether the unmodified forms in the preceding class, the words had really any living use in spoken Latin.

VI. THE LANGUAGE AS RECORDED

39. Passing now to a survey of the condition of the language at various epochs and in the different authors, we find the earliest monument of it yet discovered in a donative inscription on a fibula or brooch found in a tomb of the 7th century B.C., at Praeneste. It runs Tinyo noldi frifknab Numasom, i.e., "Naxios made me for Numason." The use of (f)h to denote the sound of Latin f supplied the explanation of the change of the symbol f from its Greek value (= Eng. v) to its Latin value f, and shows the Chalcidian Greek alphabet in process of adaptation to the needs of Latin (see Writing). The reduplicating perfect, its 3rd sing. ending -ed, the dative masculine in -oi (this is one of the only two recorded examples in Latin), the -s' between vowels (§ 251), and the -ed - in what was then (see §§ 9, 10) certainly an unaccented syllable and the accusative med, are all interesting marks of antiquity.

40. The next oldest fragment of continuous Latin is furnished by a vessel dug up in the valley between the Quininal and the Vininal early in 1856. The vessel is of a dark brown clay, and consists of three small round pots, the sides of which are connected together. All round this vessel runs an inscription, in three clauses, two nearly continuous, the third written below; the writing is from right to left, and is still clearly legible; the characters include one sign not belonging to the later Latin alphabet, namely 9, R, while the M has five strokes and the Q has the form of a Koppa.

The inscription is as follows:—

 iovest desivo qni med mixat, nie toe endo cimis virco sied, asted noist opetotesai pacari vois.

lunoq med lecced en manon eumon duemo ne med mako stato.

The general style of the writing and the phonetic peculiarities make it fairly certain that this work must have been produced not later than 500 B.C. Some points in its interpretation are still open to doubt; but the probable interpretation is:

Deos isarit ille (or iurrit ille) qui me mittant (or mittant) ne in te Virgo (i.e. Proserpina) comis sit, nisi quiddam optimo (Thesae) pacari Vis. Duenos me fecit contra Manum, Dueno autem ne per ma rem statum temporam.

He (or they) who dispatch me binds the gods (by his offering) that Proserpina shall not be kind to thee unless thou wilt make terms with (or "for") Opeto Thesias (D). Duenos made me against Manus, but let no evil fall to Duenos on my account.

41. Between these two inscriptions lies in point of date the famous stele discovered in the Forum in 1899 (G. Boni, Notiz. d. scavi, May 1899). The upper half had been cut off in order to make way for a new pavement or black stone blocks (known to archaeologists as the niger lapidis) on the site of the comitium, just to the north-east of the Forum in front of the Senate House. The inscription was written lengthwise along the (pyramidal) stele from foot to apex, but with the alternate lines in reverse directions, and one line not on the full face of any one of the four sides, but up a roughly-flattened fifth side made by slightly broadening one of the angles. No single sentence is complete and the mutilated fragments have given rise to a whole literature of conjectural "restorations."

1 The inscription was first published by Helbig and Dümmler in Mittheilungen des deutschen archäol. Inst. Rom. ii. 40; since in C.I.L. xiv. 3123 and Conway, Italic Dial. 280, where other references will be found.

2 This inscription was first published by Dressel, Annali dell' Inst. Archeol. Romano (1850), p 158, and since then by a multitude of commentators. The view of the inscription as a curse, translating a Greek cursing-formula, which has been generally adopted, was first put forward by R. S. Conway in the American Journal of Philology, x. (1889), 453; see further his commentaryItalic Dialects, p. 329, and since then G. Hempel, Trans. Amer. Philol. Assoc. xxiii. (1902), 150, whose interpretation of iovest= iuvat and Opeloi Triati has been here adopted, and who gives other references.

R. S. Conway examined it in situ in company with F. Skutsch in 1903 (cf. his article in Vollmüller's Jahresbericht, vii., 453), and the only words that can be regarded as reasonably certain are reget (regis) on face 2, kaladrom and ioumenta on face 3, and iuvcot (nest) on face 4. The 7th century B.C. may be said to be fixed by the variety of the sign for m between irr4 and irr (with q for r) and other alphabetical indications which suggest the 5th century B.C. It has been suggested also that the reason for the destruction of the stele and the repaving of the site may be sought in the attack of the Gallic invasion of 390 B.C., all traces of which, on their departure, could be best removed by a repaving; or (2) perhaps more probably, the Augustan restorations (Studnitzsch, Jahreshefte d. österreich. Inst., 1919, 20 ff.).

42. Of the earlier inscriptions the most important would be the Columna Rostra, or column of Gaius Duillius (q.v.), erected to commemorate his victory over the Carthaginians in 260 B.C., but for which the date is given by the words "crassus tabula," which necessarily makes it impossible. The shape of the letters plainly shows that the inscription, as we have it, was cut in the time of the empire. Hence Ritschel and Mommsen pointed out that the language was modified at the same time. We have therefore no examples of the language of the invasions (primus, efacient = efacient, e for i (naneb = navibus, exemt = exemt)); of these the first is probably an affected archaism, G has been introduced some time before the assumed date of the inscription. On the other hand, we have prado where we should have praed, and praed for praed; and the third is for the accusative plural forms - es, -eis and -is for the accusative plural, which are interchanged capriciously. The doubts hence arising preclude the possibility of using it with confidence as evidence for the state of the language in the 5th century B.C.

43. Of unquestionable genuineness and the greatest value are the inscription, the Scipionum Elogia. Inscribed on stone coffins, found in the monument of the Scipios outside the Capene gate (C.I.L. i., 32). The earliest fragment, for whose fourth century the later inscription is L. Cornelius Scipio Barbatus (consls 298 B.C.), the latest C. Cornelius Scipio Hispanus (praetor in 139 B.C.); but there are good reasons for believing that Ritschel that the epitaph of the first was not contemporary, but was written by his son later than the first (Ritschel, 69). This last may therefore be taken as the earliest specimen of any length of Latin and it was written at Rome; it runs as follows:

honorinc, plourrime, coscidention, romai
duoque, nunc et in fine, antiqui
lucim, scipione, filios, barbat
nomsol, censo, adiicis, hic, fuet a [pud vos]
be, cepit, corsica, alariaque, urbel
lucio, affixion in hoc ter comitam.

The archaisms in this inscription are—(1) the retention of o for u in the inflexion of both nouns and verbs; (2) the diphthongs oi (= later o) and ai (= later ae); (3) -et instead of -et, hic, et, hic, et, hic, hic; (4) duodecimo, for duodecimo; (5) duodecim for duodecimo. In every case except in Lucio, a variation which is a marked characteristic of the language of this period.

44. The oldest specimen of the Latin language preserved to us in its most original source is the Latin version of a treatise on Carminum Saliaria (Varro, De lingae Lat. vii., 26), and in one Terentianus Scuarus, but they are unfortunately so corrupt as to give us little real information (see B. Maerenbrocher, Carminum Saliarium testimonia, 1845). The text of the Twelve Tables (451-450 B.C.), if preserved in its integrity, would have been invaluable as a record of antique Latin; but it is known to us only in quotations. R. Schoell, who emended and commented (Leipzig, 1866) is the most complete, notes the following traces, among others, of an archaic syntax: (1) both the subject and the object of the verb are often left to be understood from the context, e.g. quin it antestimo, igitur, em capio; (2) the imperative is used even for permissions, si volet, plus dato, "if he choose, he may give him more;" (3) the subjunctive is apparently never used in conditional sentences.

The most important writings upon it are those of Domenico Comparetti, Isern. arcaea del Foro Romano (Florence-Rome, 1900); Haller, Berl. philol. Wochenschrift (1889), No. 40; and Thurneysen, Rheinischer Museen (Neue Folge), iii. 2, Prof. G. Pope, gave a Cronaca della discussione in a series of very useful articles in the Rivista storica antica (Messina, 1999 and 1901). Skutsch's article already cited puts the trustworthy results in an exceedingly brief compass.
only in final sentences, but the future perfect is common; (4) the connexion between sentences is of the simplest kind, and conjunctions are rare. There are, of course, numerous isolated archaisms of form and meaning, such as calidius, pacanti, endo, etc. Later and less elaborate editions are contained in Fontes Iuris Romani, by Bruns-Mommsen-Gradenwitz (1892); and P. Girard, Textes de droit romain (1895).

46. Turning now to the language of literature we may group the Latin authors as follows:—

I. Ante-Classical (240-80 B.C.).—Naevius (?) 269-204), Plautus (254-184), Ennius (239-166), Catull the Elder (234-140), Terentius (?) 159-150), Pacuvius (220-132), Accius (170-94), Lucilius (? 168-103).

II. Classical.—Golden Age (80 B.C.—A.D. 14).—Varró (116-28), Ciceró (106-44), Lucretius (95-55), Caesar (102-44), Catullus (87-? 47), Sallust (86-34), Virgúlo (70-19), Horácio (65-8), Propertius (75-? 40), Tibullo (75-? 18), Ovid (43 B.C.—A.D. 18), Livy (59 B.C.—A.D. 18).

47. Naevius and Plautus.—In Naevius we find archaisms proportionately much more numerous than in Plautus, especially in the retention of the original length of vowels, and early forms of inflexion, such as the genitive in -us and the ablative in -a. The number of archaic words preserved is perhaps due to the fact that so large a proportion of his fragments have been preserved only by the grammarians, who cited them for the express purpose of explaining these.

Of the language of Plautus important features have already been mentioned (§§ 10-16); for its more general characteristics see PLAUTUS.

48. Ennius.—The language of Ennius deserves especial study because of the immense influence which he exerted in fixing the literary style. He first established the rule that in hexameter verse all vowels followed by two consonants (except in the case of * mute and a liquid), or a double consonant, must be treated as lengthened by position. The number of varying quantities is also much diminished, and the elision of final -m becomes the rule, though not without exceptions. On the other hand he very commonly retains the original length of verbal terminations (esst., facieth) and of nominatives in or and a, and elides final -ae in in-ae.

In decansion he never uses -ae as the genitive, but -ai or -a; the older and shorter form of the gen. plur. is -um in common; obsolete forms of pronouns are used, as mis, off, (um, eum), sas, sos, sopas; and in inflexion there are old forms like morium ($ 15), fainum ($ 17, vi), potestor (cf. § 5, iv). Some experiments in the way of tmesis (passere comminuit-brum) and apocope (divum domus alstonum cue, reple te laetificum gau) were happily regarded as failures, and never came into real use. His syntax is simple and straightforward, with the occasional pleonasm of a rude style, and conjunctions are comparatively rare. From this time forward the literary language of Rome partook completely with the popular dialect. Even to the classical writers Latin was in a certain sense a dead language. Its vocabulary was not identical with that of ordinary life. Now and again a writer would lend new vigour to his style by phrases and constructions drawn from homespun speech. But on the whole, and in ever-increasing measure, the language of literature was the language of the schools, adapted to foreign models. The genuine current of Italian speech is almost lost to view with Plautus and Terence, and reappears clearly only in the semi-barbarous products of the early Romance literature.

49. Pacuvius, Accius and Lucilius.—Pacuvius is noteworthy especially for his attempt to introduce a free use of compounds after the fashion of the Greek, which were felt in the classical times to be unsuited to the genius of the Latin language, Quintilian censures severely his line.

Nerci repandostrum incurvericum pecus.

Lucilius furnishes a specimen of the language of the period, free from the restraints of tragic diction and the imitation of Greek originals. Unfortunately the greater part of his fragments are preserved only by a grammarian whose text is exceptionally corrupt; but they leave no doubt as to the justice of the criticism passed by Horace on his careless and “muddy” dictio. The urbanitas which is with one accord conceded to him by ancient critics seems to indicate that his style was free from the taint of provincial Latinity, and it may be regarded as reproducing the language of educated circles in ordinary life; the numerous Graecisms and Greek quotations with which it abounds show the familiarity of his readers with the Greek language and literature. Varro ascribes to him the gracile genus divendi, the distinguishing features of which were senustas and subillus. Hence it appears that his numerous archaisms were regarded as in no way inconsistent with grace and precision of diction. But it may be remembered that Varro was himself something of an archaizer, and also that the grammarians’ quotations may bring this aspect too much into prominence. Lucilius shares with the comic poets the use of many plebeian expressions, the love for diminutives, abstract terms and words of abuse; but occasionally he borrows from the more elevated style of Ennius forms like simius (= simul), noena (= non), facã (= facile), and the genitive in -a, and he ridicules the contemporary tragedians for their aestemata, their high-flown diction and sesquipedalia verba, which make the characters talk “not like men but like portents, flying winged snakes.” In his ninth book he discusses questions of grammar, and gives some interesting facts as to the tendencies of the language. For instance, when he ridicules a prætor urbanus for calling himself pretor, we see already the intrusion of the rustic degradation of ae into e, which afterwards became universal. He shows a great command of technical language, and (partly owing to the nature of the fragments) άρχας λεγομαι are very numerous.

50. Cato.—The treatise of Cato the elder, De re rustica, would have afforded invaluable material, but it has unfortunately come down to us in a text greatly corrupted, which is more of interest from the point of view of C. Gracchus which is preserved, there were few traces of archaism remaining. A more perfect example of the urbanitas at which good speakers aimed was supplied by a famous speech of C. Fannius against C. Gracchus, 1

1 Ciceró also refers to certain scripta dulcisima of the son of Scipio Africanus Maior, which must have possessed some merits of style.
which Cicero considered the best oration of the time. No small part of the urbanitas consisted in a correct urban pronunciation; and the standard of this was found in the language of the women of the upper classes, such as Laelia and Cornelia.

In the earliest continuous prose work which remains to us the four books De Rhetorica ad Herennium, we find the language already almost indistinguishable from that of Cicero. There has been much discussion as to the authorship of this work, now commonly, without very convincing reasons, ascribed to Q. Cornificius; but, among the numerous arguments which prove that it cannot have been the work of Cicero, none has been adduced of any importance drawn from the character of the language. It is worth while noticing that not only is the style in itself perfectly finished, but the treatment of the subject of style, elocutio (iv. 12, 17), shows the pains which had already been given to the question. The writer lays down three chief requisites—(1) elegancia, (2) compositio and (3) dignitas. Under the first come Latinitas, a due avoidance of solemnities and barbarisms, and explanatio, clearness, the employment of familiar and appropriate expressions. The second demands a proper arrangement; hiatus, alliteration, rhyme, the repetition or displacement of words, and too long sentences are all to be eschewed. Dignity depends upon the selection of language and of sentiments.

52. Characteristics of Latin Prose.—Hence we see that by the time of Cicero Latin prose was fully developed. We may, therefore, pause here to notice the characteristic qualities of the language at its most perfect stage. The Latin critics were themselves fully conscious of the broad distinction in character between their own language and the Greek. Seneca dwells upon the stately and dignified movement of the Latin period, and uses for Cicero the happy epithet of gradarius. He allows to the Greeks grata, but claims potestia for his own countrymen. Quintilian (xii. 10. 27 seq.) concedes to Greek more euphony and variety, and Latin more clearness and dignity. While the Latin language was a language of indistinctive stress and free rhythms, the Greek words are harsher in sound, and often less happily adapted to the expression of varying shades of meaning. But he too claims "power" as the distinguishing mark of his own language. Feeble thought may be carried off by the exquisite harmony and sublimeness of Greek diction; his countrymen must aim at fulness and weight of ideas if they are not to be beaten off the field. The Greek authors are like lightly moving ships; the Romans spread wider sails and are wafted by stronger breezes; hence the deeper waters suit them. It is not that the Latin language fails to respond to the calls made upon it. Lucretius and Cicero concur, it is true, in complaints of the poverty of their native language; but this was only because they had had no predecessors in the task of adapting it to philosophic utterance; and the long life of Latin technical terms like qualitas, species, genus, ratio, shows how well the need was met when it arose.

H. F. Munro has said admirably of this period—"The living Latin for all the higher forms of composition, both prose and verse, was a far nobler language than the living Greek. During the long period of Greek pre-eminence and literary glory, from Homer to Demosthenes, all the manifold features of prose and poetic language which were invented one after the other were brought to such exquisite perfection that their beauty of form and grace of language were never afterwards rivaled by Latin or any other people. But hard and slow and monosyllables and accentus ceased to live when that Attic which had been gradually formed into such a noble instrument of thought in the hands of Aristophanes, Euripides, Plato and the orators, and had superseded for general use all the other dialects, became at the same time the language of the civilized world and was stricken with a mortal decay, all the Latin authors,Seneca, Horace, the translati, who was born in the same year as Menander, writes a harsh jargon that does not deserve to be called a style; and others of whose writings anything is left entire or in fragments, historians and philosophers alike, Polybius, Cicero, Sallust, Varro, are little cylinders of artistic designs to translate any of their sentences, see what grace and life he instills into their clumsily expressed thoughts, how satisfying to the ear and taste are the periods of Livy when he is putting into Latin the heavy and barbarous Greek polyphonic rhythms and melody of the Homeric period, and what new life and new meaning when at one time he gives to Greek the preference over Latin, at another to Latin over Greek; in reading Sophocles or Plato he could acknowledge their unrivalled excellence; in translating a maso or Philodemus he would feel his own immeasurable superiority."

The greater number of long syllables, combined with the paucity of diphthongs and the consequent monotony of vocalization, and the uniformity of the accent, lent a weight and dignity of movement to the language which well suited the national gravitas. The precision of grammatical rules and the entire absence of dialectic forms from the written literature contributed to maintain the character of unity which marked the Roman republic as compared with the multiplicity of Greek states. It was remarked by Francis Bacon that artistic and imaginative nations indulge freely in verbal compounds, practical nations in simple concrete terms. In this respect, too, Latin contrasts with Greek. The attempts made by some of the earlier poets to indulge in novel compounds was felt to be out of harmony with the genius of the language. Composition, though necessarily employed, was kept within narrow limits, and the words thus produced have a sharply defined meaning, wholly unlike the poetical vagueness of some of the Greek compounds. The vocabulary of the language, though receiving accessions from time to time in accordance with practical needs, has been largely enriched by the products of a spontaneous creativeness. In literature the taste of the educated town circles gave the law; and these, trained in the study of the Greek masters of style, required something which should reproduce for them the harmony of the Greek period. Happily the orators who gave form to Latin prose were able to meet the demand without departing from the spirit of their own language.\(^1\)

53. Cicero and Caesar.—To Cicero especially the Romans owed the realization of what was possible to their language in the way of artistic finish of style. He represents a protest at one and the same time against the intrusions of the plebeius sermo, vulgarized by the constant influx of non-Italian provincials into Rome, and the "jargon of spurious and public culture" in vogue among the Roman pupils of the Asiatic rhetoricians. His essential service was to have caught the tone and style of the true Roman urbanitas, and to have fixed it in extensive and widely received speeches and treatises as the final model of classical prose. The influence of Caesar was wholly in the same direction. His cardinal principle was that every new-fangled and affected expression, from whatever quarter it might come, should be avoided by the writer, as rocks by the mariner. His own style for straightforward simplicity and purity has never been surpassed; and it is not without full reason that Cicero and Caesar are regarded as the models of classical prose. But, while they fixed the type of the best Latin, they did not and could not alter its essential character. In subtlety, in suggestiveness, in many-sided grace and versatility, it remained far inferior to the Greek. But for dignity and force, for cadence and rhythm, for clearness and precision, the best Latin prose remains unrivalled. It is needless to dwell upon the grammar or vocabulary of Cicero. His language is universally taken as the normal type of Latin; and, as hitherto the history of the language has been traced by marking differences from his usage, so the same method may be followed for what remains.

54. Varro, "the most learned of the ancients," a friend and contemporary of Cicero, seems to have rejected the periodic rhythmical style of Cicero, and to have fallen back upon a more archaic structure. Mommens says of one passage "the clauses of the sentence are arranged on the thread of the relative like dead thrushes on a string." But, in spite (some would say, because) of his old-fashioned tendencies, his language shows great vigour and spirit. In his Menippæan satires he intentionally made free use of plebeian expressions, while rising at times to a real grace and showing often fresh humour. His treatise De Re Rustica, in the form of a dialogue, is the most agreeable of his works, and where the nature of his subject allows it there is a study of the rhythm of the Caesar, i.e. of the last dozen (or less) syllables of a period in different Latin authors, has been remarkably developed in the last three years, and is of the highest importance for the criticism of Latin prose. It is only possible to refer to Th. Ziehnlenski's Das Clausulasystem in Cicero's Reden (St. Petersburg, 1894, reviewed by A. C. Clark in Classical Review, 1905, p. 164, and to F. Skutsch's important comments in Vollmöller's Jahresberichten über die Fortschritte der romanischen Philologie (1905) and Glotta (l. 1898, esp. p. 413), also to A. C. Clark's Fontes Prose in Novum, was Oxford, 1904, the Latinus in Medico and Vulgar Latin (ibid. 1910), and article CICERO.
much vivacity and dramatic picturesque ness, although the
precepts are necessarily given in a terse and abrupt form. His
sentences are as a rule co-ordinated, with but few connecting
links; his diction contains many antiquated or unique words.

55. Sallust.—In Sallust, a younger contemporary of Cicero,
we have the earliest complete specimen of historical narrative.
It is probably due to his subject-matter, at least in part, to its
style being marked by frequent archaisms; but something
must be ascribed to intentional imitation of the earlier chroni-
clers, which led him to be called priscorum Catonisque verborum
inrudissimissim fur. His archaisms consist partly of words and
phrases used in a sense for which we have only early authorities,
e.g. cum animo habere, &c., animos tollere, bene factum, consultor,
prospeta, dolus, venenum, ossis, inguis, guisere, occipere, colibe,
and the like, where we may notice especially the fondness
for frequentative, which he shares with the early comedy;
partly in inflections which were growing obsolete, such as senati,
solus, comporter (dep.), neglegisset, etc. (acc. pl.) nequiter.
In syntax his constructions are for the most part those of the
contemporary writers.

56. Lucan.—Lucan is largely archaic in his style. We find im for
eum, endo for in, illæ, illæ, unæ, and are as genitives, alid
for alius, rabies as a genitive by the side of genitives in -oi,
ablative in -like colli, orbi, parti, nominatives in s for r, like
calos, wapos, humos. In verbs there are scall, fulgit, quaesit,
confused-as-confusisset, recegisse-rassis, inducisse for inicere;
simple forms like fugere, lascere, cedere, stinguere for the more
usual compounds, the infinitive passive in -ier, and archaic
forms from esse like sid, escit, fuat. Sometimes he indulges
in tenses which reminds us of Ennius: inque pederi, disque
supula, ordis prima. But this archaic tinge is adopted only for
poetical purposes, and as a proof of his devotion to the earlier
masters of his art; it does not affect the general substance of
his style, which is of the freshest and most vigorous stamp.
But the purity of his idiom is not gained by any slavish adherence
to a recognized vocabulary; he coins words freely; Munro
has noted more than a hundred irrus, legumæ, or words which
he alone among good writers uses. Many of these are formed
on familiar models, such as compounds and frequentatives;
others are directly borrowed from the Greek apparently with
a view to sweetness of rhythm (ii. 412, v. 334, 505); others again
(forty or more in number) are compounds of a kind which
the classical language refused to adopt, such as silvisfragus,
terriluosus, perterricrepus. He represents not so much a stage
in the history of the language as a protest against the tendencies
victorious in his own time. But his influence was deep upon
Virgil, and through him upon all subsequent Latin literature.

57. Catullus.—Catullus gives us the type of the language of the
cultivated circles, lifted into poetry by the simple directness with which
it is used to express emotion. In his heroic and elegiac poems
he did not escape the influence of the Alexandrian school, and
his genius is ill suited for long-continued flights; but in his
lyric poems his language is altogether perfect. As Macaulay
says: "No Latin writer is so Greek. The simplicity, the pathos,
the perfect grace, which I find in the great Athenian models are
all in Catullus, and in him alone of the Romans." The language
of these poems comes nearest perhaps to that of Cicero's more
intimate letters. It is full of colloquial idioms and familiar
language, of the diminutives of affection or of playfulness.
Greek words are rare, especially in the lyrics, and those which
are employed are only such as had come to be current coin.
Archaisms are but sparingly introduced; but for metrical
reasons he has four instances of the inf. pass., -ier, and several
contracted forms; we find also alis and alid, uni (gen.), and
the antquated ictus and recepe. There are traces of the popular
language in the shortened imperatives cade and manse, in the
analytic perfect paratem habes, and in the use of unus approaching
that of the indefinite article.

58. Horace.—The poets of the Augustan age mark the opening
of a new chapter in the history of the Latin language.
The influence of Horace was less than that of his friend and
contemporary Virgil; for Horace worked in a field of his own, and,
although Statius imitated his lyrics, and Persius and Juvenal,
especially the former, his satires, on the whole there are few
traces of any deep marks left by him on the language of later
writers. In his Satires and Epistles the diction is that of the
contemporary urbanity, differing hardly at all from that of
Cicero in his epistles and dialogues. The occasional archaisms,
such as the syncope in erepsmus, evoae, suureae, the infinitives
in -ier, and the genitives deum, divum, may be explained as still
conversationally allowable, though ceasing to be current in
literature; and a similar explanation may account for plebeian
terms, e.g. balatres, balater, garrio, mutto, vappo, caludus, soldus,
surfite, for the numerous diminutives, and for such pronouns,
adverbs, conjunctions and turns of expression as were common
in prose, but not found, or found but rarely, in elevated poetry.
Greek words are used sparingly, not with the licence which he
invores in Lucullus, and in his hexameters are framed according
to Latin rules. In the Odes, on the other hand, the language is
mixed; but it is necessarily limited. There are practically no archaisms
(spargier in Carm. iv. 11. 8 is a doubtful exception), or plebeian
expressions; Greek inflections are employed, but not with the
licence of Catullus; there are no datives in t or sin like Tekty
or Dryasian; Greek constructions are fairly numerous, e.g.
the genitive with verbs like regnare, obstinere, desinere, and with
adjectives, as integer vitae, the so-called Greek accusative,
the dative with verbs of contest, like lactari, discercare, the
transitive use of many intransitive verbs in the past participle, as
regnatus, triumphantus; and finally there is a "prolative" use of
the infinitive after verbs and adjectives, where prose would
have employed other constructions, which, though not limited
to Horace, is more common with him than with other poets.
Compounds are very sparingly employed, and apparently only
when sanctioned by authority. His own innovations in vocab-
ulary are not numerous. About eighty irrus, legumæ have been
noted. Like Horace, he shared his master's skill in the use
of language rather than the selection from already existing stores,
and in the creation of new resources: tantum series lucturâque
pollet. But both his diction and his syntax left much less marked
traces upon succeeding writers than did those of either Virg
or Ovid.

59. Virgil.—In Virgil the Latin language reached its full
maturity. What Cicero was to the period, Virgil was to the
hexameter; indeed the changes that he wrought were still
more marked, inasmuch as the language of verse admits of
greater subtlety and finish than even the most artistic prose.
For the straightforward idiomatic simplicity of Lucretius and
Catullus he substituted a most exact and felicitous diction, rich
with the suggestion of the most varied sources of inspiration.
Sometimes it is a phrase of Homer's "conveyed" literally with
happy boldness, sometimes it is a line of Ennius, or again some
artistic Sophoclean combination. Virgil was equally familiar
with the great Greek models of style and with the earlier Latin
poets. This learning, guided by an unerring sense of fitness and
harmony, enabled him to give to his diction a music which recalls
at once the fullest tones of the Greek lyre and the lofty strains
of the most genuinely national song. His love of antiquarianism
in language has often been noticed, but it never passes into
pedantry. His vocabulary and constructions are often such as
would have conveyed to his contemporaries a grateful flavour
of the past, but they would never have been unintelligible.
Forms like iussus, olle or admirer can have delayed no one.

In the details of syntax it is difficult to notice any peculiarly
Virgilian points, for the reason that his language, like that of
Cicero, became the canon, departures from which were accounted
irregularities. But we may notice as fortunate constructions
a free use of oblique cases in the place of the more definite
constructions with prepositions usual in prose, e.g. il charor, ca
flata nodet, vis cum custos, nos victores, and many similar phrases;
the employment of some substantives as adjectives, like senatur canis;
and vice versa, as plurimus voltus; a proleptic use of adjectives, as tristis torqubet; idioms involving
ille, alque, deinde, hau, quin, vix, and the frequent occurrence
of passive verbs in their earlier reflexive sense, as induo, color, poscor.
60. **Livy.**—In the singularly varied and beautiful style of Livy we find Latin prose in rich maturity. To a training in the rhetorical schools, and perhaps professional experience as a teacher of rhetoric, he added a thorough familiarity with contemporary poetry and with the Greek language; and these attainments have all deeply coloured his language. It is probable that the variety of style naturally suggested by the wide range of his subject matter was increased by a half-unconscious adoption of the phrases and constructions of the different authorities whom he followed in different parts of his work; and the industry of German critics has gone far to demonstrate a conclusion likely enough in itself. Hence perhaps comes the fairly long list of archaisms, especially in formulae (cf. Kühnast, *Liv. Syl. pp. 14-18*). These are, however, purely isolated phenomena, which do not affect the general tone. It is different with the poetical constructions and Graecisms, which appear on every page. Of the latter we find numerous instances in the use of *ita causadus lato* like *via praeced et missae, opifemum Antiociae, acquam campum*; in dative like *quidusdam volentibus erat*; in accusatives like *iurare columnium, certare malum*; an especially frequent use of transitive verbs absolutely; and the constant omission of the reflexive pronoun as the subject of an infinitive in reported speech. To the same source must be assigned the very frequent pregnant construction with prepositions, an attraction of relatives, and the great extension of the employment of relative adverbs of place instead of relative pronouns, *e.g. quo = in quem*. Among his poetical characteristics we may place the extensive list of words which are found for the first time in his works and in those of Virgil or Ovid, and perhaps his common use of concrete words for collective, *e.g. equus for equitatus*, of abstract terms such as *remigium, serenita, robora*, and of frequentative verbs, to say nothing of poetical phrases like *haec ubi dicta dedit, adversum montium*, &c. Indications of the extended use of the subjunctive, which he uses with conscientiousness though only by implication, are found, and is sometimes so used as to be undistinguishable from the indicative *sub stance*; for instance, *ubi fortuna vehetur... fortuna locutus est in eo tertio*.

61. **Propertius.**—The language of Propertius is too distinctly his own to call for detailed examination here. It cannot be taken as a specimen of the great current of the Latin language; it is rather a tributary springing from a source apart, tinging to some slight extent the stream into which it pours itself, but soon ceasing to affect it in any perceptible fashion. "His obscurity, his indirectness and his incoherence" (to adopt the words of J. P. Postgate) were too much out of harmony with the Latin taste for him to be regarded as in any sense representative; sometimes he seems to be hardly writing Latin at all. Partly from his own strikingly independent genius, partly from his profound and not always judicious study of the Alexandrian writers, his poems abound in phrases and constructions which are without a parallel in Latin poetry. His archaisms and Graecisms, both in diction and in syntax, are very numerous; but frequently there is a freedom in the use of cases and prepositions which can only be due to bold and independent innovations. His style well deserves a careful study for its own sake (cf. J. P. Postgate's *Introduction*, pp. lvi.-cxxxv.); but it is of comparatively little significance in the history of the language.

62. **Ovid.**—The brief and few poems of Tibullus supply only what is given much more fully in the works of Ovid. In these we have the language recognized as that best fitted for poetry by the fashionable circles in the later years of Augustus. The style of Ovid bears many traces of the imitation of Virgil, Horace and Propertius, but it is not less deeply affected by the rhetoric of the schools. His never-failing fertility of fancy and command of diction often lead him into a diffuseness which mars the effect of his best works; according to Quintilian it was only in his (lost) tragedy of *Medea* that he showed what real excellence he might have reached if he had chosen to control his natural powers. His influence on later poets was largely for evil; if he taught them smoothness of versification and polish of language, he also co-operated powerfully with the practice of recitation to lead them to aim at rhetorical point and striking turns of expression, instead of a firm grasp of a subject as a whole, and due subordination of the several parts to the general impression. Ovid's own influence on language was not great; he took the forms unknown to the feast Latin, formed *tria tone* and 2nd. *exponent*, his predecessors; the conflict between the archaistic and the Graecizing schools was already settled in favour of the latter; and all that he did was to accept the generally accepted models as supplying the material in moulding which his luxuriant fancy could have free play. He has no deviations from classical syntax but those which were coming into fashion in his time *(e.g. forsi tan and quae vis with the indic., the dative with the agent with passive verbs, the ablative for the accusative of time, the infinitive after adjectives like certus, optus, &c.)*, and but few peculiarities in his vocabulary. It is only in the letters from the Pontus that laxities of construction are detected, which show that the purity of his Latin was impaired by his residence away from Rome, and perhaps by increasing carelessness of composition.

63. **The Latin of Daily Life.**—While the leading writers of the Ciceronian and Augustan eras enable us to trace the gradual development of the Latin language to its utmost finish as an instrument of literary expression, there are some less important authors who supply valuable evidence of the character of the *sermo plebeius*. Among them are placed the authors of the *Bellum Africannum* and the *Bellum Hispaniannse* appended to Caesar's Commentaries. These are not only far inferior to the exquisite *urbanitas* of Caesar's own writings; they are much rougher in style even than the less polished *Bellum Alexandrinum* and *De Bello Gallico Liber VIII.*., which are now with justice ascribed to Hirtius. There is sufficient difference between the two to justify us in assuming two different authors; but both freely employ words and constructions which are at once antiquated and vulgar. The writer of the *Bellum Alexandrinum* uses a larger number of diminutives within his short treatise than Caesar in nearly ten times the space; *postquum* and *ubi* are used with the pluperfect subjunctive; there are numerous forms unknown to the feast Latin, like *vicarii*, *explicere*, *cruciobilder* and *consolnoro*; *potior* is followed by the accusative, a simple relative by the subjunctive. There is also a very common use of the pluperfect for the imperfect, which seems a mark of this *plebeius sermo* (Nipperdey, *Quaest. Caes. pp. 13-30*).

Another example of what we may call the Latin of business life is supplied by Vitruvius. Besides the obscurity of many of his technical phrases, there is a lack of Latin usage, far removed from a literary style; he uses the incorrect use of the pluperfect, and uses plebeian forms like *calefaciuntur, nutricare*, *expertiones* and such careless phrases as *rogavi Archimedum ut in domum sub de eo cogitationem.* At a somewhat later stage we have, not merely plebeian, but also provincial Latin as represented in the *Satyricon* of Petronius. The narrative and the poems which are introduced into it are written in a style distinguished only by the ordinary peculiarities of small Latinity; but in the numerous conversations of the slaves and provincials which the various speakers are accurately preserved; and we have in the talk of the slaves and provincials a perfect storehouse of words and constructions of the greatest linguistic value. Among the unclassical forms and constructions may be noticed masculines like *fatus, strica, balmeus, feculus* and *lacem* (for laco), *stripa* for *stripis*, *gudismionum* and *tristingionem*, *sanguen, mandacure, nutritore, molestare, neupus* (*napus* = Fr. *sage*), *rostrum (= os), epismus (= master), scordalas, bares*, and numerous diminutives like *cailima, audaculas, potiobula.*
Latin.

65. Seneca, Persius and Lucan.—In the writers of Nero's age there are already plain indications of the evil effects of the rhetorical schools upon language as well as literature. The leading man of letters was undoubtedly Seneca the younger, "the Ovid of prose"; and his style set the model which it became almost a fashion to imitate. But it could not commend itself to the judgment of sound critics like Quintilian, who held firmly to the great masters of an earlier time. He admits its brilliancy, and the fertility of its pointed reflections, but charges the author justly with want of self-restraint, jerkiness, frequent repetitions and tawdry tricks of rhetoric. Seneca was the worst of models, and pleased by his very faults. In his tragedies the rhetorical elaboration of the style only serves to bring into prominence the frigidity and frequent bad taste of the matter. But his diction is on the whole fairly classical; he is, in the words of Muretus, *tutelis sermonis diligenter quam quidam inepte fastidiosi suspicantur.* In Persius there is a constant straining after rhetorical effect, which fills his verses with harsh and obscure expressions. The careful choice of diction by which his master Horace makes every word tell is exaggerated into an endeavour to gain force and freshness by the most contorted phrases. The sin of allusiveness is fostered by the fashion of the day for epigram, till his lines are barely intelligible after repeated reading. Conington happily suggested that this style was assumed only for satiric purposes, and pointed out that when not writing satire Persius was as simple and unaffected as Horace himself. This view, while it relieves Persius of much of the censure which has been directed against his want of judgment, makes him all the more typical a representative of this stage of silver

66. Pliny, Quintillian, Frontinus.—In the elder Pliny the same tendencies are seen occasionally breaking out in the midst of the prosaic and inartistic form in which he gives out the stores of his cumbrous erudition. Wherever he attempts a loftier tone than that of the mere compiler, he falls into the tricks of Seneca. The nature of his encyclopaedic subject matter naturally makes his vocabulary very extensive; but in syntax and general tone of language he does not differ materially from contemporary writers. Quintilian is of interest especially for the sound judgment which led him to a true appreciation of the writers of Rome's golden age. He set himself strenuously to resist the tawdry fashionable in his own time, and to hold up before his pupils purer and loftier models. His own criticisms are marked by excellent taste, and often by great happiness of expression, which is pointed without being unduly epigrammatic. But his own style did not escape, as indeed it hardly could, the influences of his time; and in many small points his language falls short of classical purity. There is more approach to the simplicity of the best models in Frontinus, who furnishes a striking proof that it was rather the corruption of literary taste than any serious change in the language of ordinary cultivated men to which the prevalent style was due. Writing on practical matters—the art of war and the water-supply of Rome—he goes straight to the point without rhetorical flourishes; and the ornaments of style which he occasionally introduces serve to embellish but not to distort his thought.

67. The Flavian Age.—The epic poets of the Flavian age present a striking contrast to the writers of the Claudian period. As a strained originality was the cardinal fault of the one school, so a tame and slavish following of authority is the mark of the other. The general correctness of this period may perhaps be ascribed (with Merivale) partly to the political conditions, partly to the establishment of professional schools. Teachers like Quintilian must have done much to repress extravagance of thought and language; but they could not kindle the spark of genius. Valerius Flaccus, Silius Italicus and Papinius Statius are all correct in diction and in rhythm, and abound in learning; but their inspiration is drawn from books and not from nature or the heart; details are elaborated to the injury of the impression of the whole; every line is laboured, and overcharged with epigrammatic rhetoric. Statius shows by far the greatest natural ability and freshness; but he attempts to fill a broad canvas with drawing and colouring suited only to a miniature. Juvenal exemplifies the tendencies of the language of his time, as moulded by a singularly powerful mind. A careful study of the earlier poets, especially Virgil and Lucan, has kept his language up to a high standard of purity. His style is eminently rhetorical; but it is rhetoric of real power. The concise brevity by which it is marked seems to have been the result of a deliberate attempt to mould his natural diffuseness into the form recognized as most appropriate for satire. In his verses we notice a few metrical peculiarities which represent the pronunciation of his age, especially the shortening of the final -o in verbs, but as a rule they conform to the Virgilian standard. In Martial the tendency of this period to witty epigram finds its most perfect embodiment, combined with finished versification.

68. Pliny the Younger and Tacitus.—The typical prose-writers of this time are Pliny the younger and Tacitus. Some features of the style of Tacitus are peculiar to himself; but on the whole the following statement represents the tendencies shared in greater or less degree by all the writers of this period. The gains lie mainly in the direction of a more varied and occasionally
more effective syntax; its most striking defect is a lack of harmony in the periods, of arrangements in words, of variety in particles arising from the loose connexion of sentences. The vocabulary is extended, but there are losses as well as gains. Quintilian's remarks are fully borne out by the evidence of extant authorities; on the one hand, quid quod nihil iam proprum placed, dum parum creditur disertum, quod et alius diciess (vii. proxem. 24); a corruptissimo quoque postdumur figurae seu translationes mutuamus; tum demum ingeniosi scilicet, si ad intelligendos nos opus sit ingenio (ib. 25); sordet omne quod nauta dictivit (ib. 26); on the other hand, nunc utique, cum hac exercitation procul a veritate setulata labore incrediil verbis factum, ac sibi magnam partem sermonis absentem (viii. 3, 23), mulie collidit ab antiquis fusis moritur (ib. 6, 32). A writer like Suetonius therefore did good service in introducing into his writings terms and idioms unknown, not from the rhetoricians, but from the usage of daily life.

69. In the vocabulary of Tacitus there are to be noted:—

1. Words borrowed (consciously or unconsciously) from the classical poets, especially Virgil, occurring for the most part also in contemporary prose. Of these Dröger gives a list, of ninety-five (Syntaxis et Stil des Tacitus, p. 96).

2. Words occurring only, or for the first time, in Tacitus. These are for the most part new formations or compounds from stems already in use, e.g. to componere, " to bury"; scriptura, " a writing"; tertius, " third"; and -sus, -sura, -mentum, with new frequentatives.

3. Words used with a meaning (a) not found in earlier prose, but sometimes borrowed from the poets, e.g. component, " to bury"; scripturum, " a written"; tertius, " third"; and -sus, -sura, -mentum, with new frequentatives.

Generally speaking, the participles of the dative and ablative cases of the verb, especially those derived from stems ending in -ius, -iusis, -i, have become more common in Tacitus, as the dative and ablative of a verb are frequently followed by the accusative where the dative might have been expected; and the Virgilian construction of an accusative with middle and passive verbs is not unusual. The dative of purpose and the dative with a substantive in place of a genitive are more common with Tacitus than with any other writer.

The ablative of separation is used without a preposition, even with names of countries and with common nouns; the ablative of place is employed where it was formerly supplied by adverbial cases ending in -a, -a, -ram, -ram, -ram, -ram, -ram, -ram, and the like.

In Tacitus the dative is sometimes used for the genitive, especially in the use of a preposition with that of a simple case in corresponding clauses. In subordinate sentences quod is used for the " fact that," and sometimes approaches the latter use of " that, the infinitive follows many verbs and adjectives that do not admit of this construction in classical prose; the accusative and infinitive are used after negative expressions of doubt, and even in modal and hypothetical clauses.

Like many other writers of this time freely employ the subjunctive of repeated action with a relative, and extend its use to relative conjunctions, which he does not. In clauses of comparison and proportion there is frequently an ellipse of a verb (with nihil alio videtur quod), quod and quodam are used to imply not comparison but alleged reason; quae and quaequum are interchanged at pleasure. Quamquam and quamquam are commonly followed by the subjunctive, even when denoting facts. The free use of a subjunctive of the gerundive to denote purpose is common in Tacitus, the former being almost limited to him. Livy's practice in the use of participles is extended even beyond the limits to which he restricts it. It has been calculated that where Caesar uses an imperfect, as it is usually translated in Tacitus is twice as frequent.

In his comprehensive brevity Tacitus may be said to be individual; but in the poetical colouring of his diction, in the rhetorical cast of his sentences, and in his love for picturesqueness and variety he is a true representative of his time.

70. Suetonius.—The language of Suetonius is of interest as giving a specimen of silver Latin almost entirely free from personal idiosyncrasies; his expressions are regular and straightforward, clean and business-like; and, while in grammar he does not attain to classical purity, he is comparatively free from rhetorical affectations.

71. The African Latinist.—A new era commences with the accession of Hadrian (117). As the preceding half century had been marked by the influence of Spanish Latinity (the Senecas, Lucan, Martial, Quintilian), so in this the African style was paramount. This is the period of affected archaisms and pedantic learning, combined at times with a reckless love of innovation and experiment, resulting in the creation of a large number of new formations and in the adoption of much of the plebeian dialect. Fronto and Apuleius mark a strong reaction against the culture of the preceding century, and for evil far more than for good the chain of literary tradition was broken. The language which had been unduly refined and elaborated now relapsed into a taste for patch-work, without either harmony or brilliance of colouring. In the language of the former the subject matter is no set-off against the inferiority of the style. He deliberately attempts to go back to the obsolete diction of writers like Cato and Ennius. We find compounds like allipendulis, nudiustertionum, toluiteliquo, diminutives such as matercella, anulla, passerculo, studilium, forms like congarrire, discoccupire, pedetemptius, desiderantissimus (passive), contincimium; gaudco, oboeido and perfungor are used with an accusative, modestus with a genitive. On the other hand he actually attempts to revive the form asa for ara. In Apuleius the archaic element is only one element in the queer mixture which constitutes his style, and it probably was not intended to give the tone to the whole. Poetical and prosaic phrases, combinations of archaisms, alternating with some code, and the jargon of the former seemingly on the spur of the moment, all appear in this wonderfodly way. There are found such extraordinary genitives as sitire beatidusin, cense pignorarer, incorum omnium, foras corporis, sometimes heaped one upon another as fuxos vestium Arsacidis et frugam paueres Hylaos et odorum divites Arabas. Diminutives are coined with reckless freedom, e.g. diutile, longule, moldue amitca et altisculesub ipsas papellae succincula. He confesses himself that he is writing in a language not familiar to him: In urbe Latina advena studiorum Quiritium indigenam sermonemsuccumulabotur, nullo magistro praeante, aggressus escoulo; and the general impression of his style fully bears out his confession. Melanchthon is hardly too severe when he says that Apuleius brays like his own ass. The language of his work is a purgation of the elements of the code. The classical hands in the humanist, the archaic and archaistic, e.g. educere, recentari, aeroscorus, and in meaningless frequentatives like solitiviso. He has some admirable remarks on the pedantry of those who delighted in obsolete expressions (xi. 7) such as aplexa, flocus and botinor; but his practice falls far short of his theory.

72. The Lawyers.—The style of the eminent lawyers of this period, foremost among whom is Gaius, deserves especial notice as showing well one of the characteristic excellences of the Latin language. It is for the most part dry and unadorned, and in syntax departs occasionally from classical usages, but it is clear, terse and exact. Technical terms may cause difficulty to the ordinary reader, but their meaning is always precisely defined; new compounds are employed whenever the capacity of the language rise to the demands made upon it; and the conceptions of jurisprudence have never been more adequately expressed than by the great Romanist jurists.

A. S. W.; R. S. C.)

For the subsequent history of the language see Roman LANGUAGES.

LATIN LITERATURE. The germ of an indigenous literature had existed at an early period in Rome and in the country districts of Italy, and they have an importance as indicating natural wants in the Italian race, which were ultimately satisfied by regular literary forms. The art of writing was first employed in the service of the state and of religion for books of ritual, treaties with other states, the laws of the Twelve Tables and the like. An approach to literature was made in the case of the Prese Alexandrini, of private families, funeral orations and inscriptions on busts and tombs such as those of the Scipios in
the Appian Way. In the satisfaction they afforded to the commemorative and patriotic instincts they anticipated an office afterwards performed by the national epics and the works of regular historians. A still nearer approach to literature was probably made in Italy as a last resort for the Gauls, with the famous speech delivered by Appius Claudius Caecus against concluding peace with Pyrrhus (280 B.C.) was extant in his time. Appius also published a collection of moral maxims and reflections in verse. No other name associated with any form of literature belonging to the pre-literary age has been preserved by tradition.

But it was rather in the chants and litanies of the ancient religion, such as those of the Salii and the Fratres Arvales, and the dirges for the dead (neniae), and in certain extemporean effusions, that some germ of a native poetry might have been detected; and finally in the use of Saturnian verse, a metre of pure native origin, which by its rapid and lively movement gave expression to the vivacity and quick apprehension of the Italian race. This metre was employed in ritual hymns, which seem to have assumed definite shapes out of the exclamations of a primitive priesthood engaged in a rude ceremonial dance. It was also used by a class of bards or itinerant soothsayers known by the name of rutes, of whom the most famous was one Marcus, and in the "Fescennine verses," as sung at harvest-homes and weddings, which gave expression to the coarse gaiety of the people and to their strong tendency to personal raillery and satiric comment. The metre was also employed in commemorative processions accompanied with music, which were sung at funerals, banquets, in celebration of the exploits and virtues of distinguished men. These had their origin in the same impulsion which ultimately found its full gratification in Roman history. Roman epic poetry, and that form of Roman oratory known as laudationes, and in some of the Odes of Horace. The latest and probably the most important of these rude and inchoate forms was that of dramatic saturae (medleys), put together without any regular plot and consisting apparently of contests of wit and satiric invective, and perhaps of comments on current events, accompanied with music (Liv. vii. 2). These have a real bearing on the subsequent development of Latin literature. They prepared the mind of the people for the reception of regular comedy. They may have contributed to the formation of the style of comedy which appears at the very outset much more sanctified than that of serious poetry, tragic or epic. They gave the name and some of the characteristics to that special literary product of the Roman soil, the satira, addressed to readers, not to spectators, which ultimately was developed into pure poetic satire in Lucilius, Horace, Persius and Juvenal, into the prose and verse miscellany of Varro, and into something approaching the prose novel in Petronius.

First Period: from 240 to about 80 B.C.

The historical event which brought about the greatest change in the intellectual condition of the Romans, and thereby exercised a decisive influence on the whole course of human culture, was the capture of Tarentum in 272. After the capture many Greek slaves were brought to Rome, and among them the young Livius Andronicus (c. 284-204), who was employed in teaching Greek in the family of his master, a member of the Livian gens. From that time to learn Greek became a regular part of the education of a Roman noble. The capture of Tarentum was followed by the complete Romanizing of all southern Italy. Soon after came the first Punic war, the principal scene of which was Sicily, where, from common hostility to the Carthaginian, Greek and Roman were brought into friendly relations, and the Roman armies have become familiar with the spectacles and performances of the Greek theatre. In the year after the war (240), when the armies had returned and the people were at leisure to enjoy the fruits of victory, Livius Andronicus substituted at one of the public festivals a regular drama, translated or adapted from the Greek, for the musical medleys (satirae) hitherto in use. From this time dramatic performances became a regular accompaniment of the public games, and came more and more to encroach on the older kinds of amusement, such as the chariot races. The dramatic work of Livius was mainly of educative value. The same may be said of his translation of the Odyssey, which was still used as a school-book in the days of Horace, and the religious pyramids which he called upon to compose in 207 had no high literary pretensions. He was, however, the first to familiarize the Romans with the forms of the Greek drama and the Greek epic, and thus to determine the main lines which Latin literature followed for more than a century afterwards.

His immediate successor, Cn. Naevius (d. c. 200 B.C.), was not, like Livius, a Greek, but either a Roman citizen or, more probably, a Campanian who enjoyed the limited citizenship of a Latin and who had served in the Roman army in the first Punic War. His first appearance as a dramatic author was in 235. He adapted both tragedies and comedies from the Greek, but the bent of his genius, the tastes of his audience, and the condition of the language developed through the active intercourse and business of life, gave a greater impulse to comedy than to tragedy. Naevius tried to use the theatre, as it had been used by the writers of the Old Comedy of Athens, for the purposes of political warfare, and thus seems to have anticipated by a century the part played by Lucilius. But his attacks upon the Roman aristocracy, especially the Metelli, were resented by their objects; and Naevius, after being imprisoned, had to retire in his old age into banishment. He was not only the first in point of time, and according to ancient testimony one of the first in point of merit, among the comic poets of Rome, and in spirit not in form, the earliest of the line of Roman satirists, but he was also the oldest of the national poets. Besides celebrating the success of M. Claudius Marcellus in 222 over the Gauls in a play called Clastidium, he gave the first specimen of the fabula praetexta in his Alimonium Romuli et Remi, based on the most national of all Roman traditions. Still more important service was rendered by him in his long Saturnian poem on the first Punic War, in which he not only told the story of contemporary events but gave shape to the legend of the settlement of Aeneas in Latium,—the theme ultimately adopted for the great epic national of Rome.

His younger contemporary T. Maccius Plautus (c. 254-184) was the greatest comic dramatist of Rome. He lived and wrote only to amuse his contemporaries, and thus, although more popular in his lifetime and more fortunate than any of the older authors in the ultimate survival of a large number of his works, he is less than any of the great writers of Rome in sympathy with either the serious or the caustic spirit in Latin literature. Yet he is the one extant witness to the humour and vivacity of the Italian temperament at a stage between its early rudeness and rigidity and its subsequent degeneracy. Plautus. The characteristics of his spirit are dignity, gravity and fervour of feeling, seemed likely to become a mere vehicle of amusement adapted to all classes of the people in their holiday mood. But a new spirit, which henceforth became predominant, appeared in the time of Plautus. Latin literature ceased to be in close sympathy with the popular spirit, either politically or as a form of amusement, but became the expression of the ideas, sentiment and culture of the aristocratic governing class. It was by Q. Ennius (239-169) of Rudiae in Messapia, that a new direction was given to Latin literature. Deriving from his birthplace the culture, literary and philosophical, of Magna Graecia, and having gained the friendship of the greatest of the Romans living in that great age, he was of all the early writers most fitted to be the medium of conciliation between the serious genius of ancient Greece and the serious genius of Rome. Alone among the older writers he was endowed with the gifts of a poetical imagination and animated with enthusiasm for a great ideal.

First among his special services to Latin literature was the fresh impulse which he gave to tragedy. He turned the eyes of his far more prominent contemporaries to the changing social humours of later Greek life and to the contemplation of the heroic age. But he did not thereby denationalize the Roman drama. He animated the heroes of early Greece with the martial spirit of Roman.
soldiers and the ideal magnanimity and sagacity of Roman senators, and imparted weight and dignity to the language and verse in which their sentiments and thoughts were expressed. Although Rome wanted creative force to add to a great series of tragic dramas to the literature of the world, yet the spirit of elevation and moral authority breathed into tragedy by Ennius passed into the ethical and didactic writings and the oratory of a later time.

Another work was the Saturae, written in various metres, but chiefly in the trochaic tetrameter. He thus became the inventor of a new form of literature; and, if in his hands the satura was rude and indeterminate in its scope, it became a vehicle by which to address a reading public on matters of the day, or on the materials of his wide reading, in a style not far removed from the language of common life. His greatest work, which made the Romans regard him as the father of their literature, was his epic poem, in eighteen books, the Annales, in which the record of the whole career of Rome was unrolled with idealizing enthusiasm and realistic detail. The idea which inspired Ennius was ultimately realized in both the national epic of Virgil and the national history of Livy. And the metrical vehicle which he conceived as the only one adequate to his great theme was a rude experiment, which was ultimately developed into the stately Virgilian hexameter. Even as a grammarian he performed an important service to the literary language of Rome, by fixing its prosody and arresting the tendency to decay in its final syllables. Although of his writings only fragments remain, these fragments are enough, along with what we know of his work from ancient testimony, to justify us in regarding him as the most important among the makers of Latin literature before the age of Cicero.

There is still one other name belonging partly to this, partly to the next generation, to be added to those of the men of original force of mind and character who created Latin literature, that of M. Porcius Cato the Censor (234-149), the younger contemporary of Ennius, whom he brought to Rome. More than Naevius and Plautus he represented the pure native element in that literature, the mind and character of Latium, the plebeian pugnacity, which was one of the great forces in the Roman state. His lack of imagination and his narrow patriotism made him the natural leader of the reaction against the new Hellenic culture. He strove to make literature ancillary to politics and to objects of practical utility, and thus started prose literature on the chief lines that it afterwards followed. Through his industry and vigorous understanding he gave a great impulse to the creation of Roman oratory, history and systematic didactic writing. He was one of the first to publish his speeches and thus to bring them into the domain of literature. Cicero, who speaks of 150 of these speeches as extant in his day, praises them for their acuteness, their wit, their conciseness. He speaks with emphasis of the impressiveness of Cato’s eloquence and the satiric bitterness of his invective.

Cato was the first historical writer of Rome to use his native tongue. His Origines, the work of his old age, was written with that thoroughly Roman conception of history which regarded actions and events solely as they affected the continuous and progressive life of a state. Cato felt that the record of Roman glory could not be isolated from the story of the other Italian communities, which, after fighting against Rome for their own independence, shared with her the task of conquering the world. To the wider national sympathies which stimulated the researches of the old censor into the legendary history of the Italian towns we owe some of the most truly national parts of Virgil’s Aeneid.

In Naevius, Plautus, Ennius and Cato are represented the contending forces which strove for ascendency in determining what was to be the character of the new literature. The work, begun by them, was carried on by younger contemporaries and successors; by Statius Caecilius (c.220-168), an inauspicious Gaul, in comedy; in tragedy by M. Pacuvius (c.220-132), the nephew of Ennius, called by Cicero the greatest of Roman tragedians, and, in the following generation, by L. Accius (c.170-86), who was more usually placed in this position. The impulse given to oratory by Cato, Ser. Sulpicius Galba and others, and along with it the development of prose composition, went on with increased momentum till the age of Cicero. But the interval between the death of Ennius (169) and the beginning of Cicero’s career, while one of progressive advance in the appreciation of literary form and style, was much less distinguished by original force than the time immediately before and after the end of the second Punic war. The one complete survival of the generation after the death of Ennius, the comedy of P. Terentius Afer or Terence (c.185-159), exemplifies the gain in literary accomplishment and the loss in literary freedom. Terence has nothing Roman or Italian except his pure and idiomatic Latinity. His Athenian elegance affords the strongest contrast to the Italian rudeness of Cato’s De Re Rustica. By looking at them together we understand how much the comedy of Terence was able to do to refine and humanize the manners of Rome, but at the same time what a solvent it was of the discipline and ideas of the old republic. What makes Terence an important writer of the culture of his time is that at the centre of the Scipionic circle, in which what was most humane and liberal in Roman statesmanship was combined with the appreciation of what was most vital in the Greek thought and literature of the time. The comedies of Terence may therefore be held to give some indication of the tastes of Scipio, Laelius and their friends in their youth. The influence of Panaetius and Polybius was more adapted to their maturity, when they led the state in war, statesmanship and oratory, and when the humaner teaching of Stoicism began to enlarge the sympathies of Roman jurists. But in the last years during which this circle kept together a new spirit appeared in Roman politics and a new power in Roman literature—the revolutionary spirit evoked by the Gracchi in opposition to the long-continued ascendency of the senate, and the new power of Roman satire, which was exercised impartially and un sparingly against both the excesses of the revolutionary spirit and the arrogance and incompetence of the extreme party among the nobles. Roman satire, though in form a legitimate development of the indigenous dramatic satura through the written satura of Ennius and Pacuvius, is really a birth of this time, and its author was the youngest of those admitted into the intimacy of the Scipionic circle, C. Lucilius of Suessa Aurunca (c.180-163).

Lucilius.

Among the writers before the age of Cicero he alone deserves to be named with Naevius, Plautus, Ennius and Cato, as a great origictive force in literature. For about thirty years the most important event in Roman literature was the production of the satires of Lucilius, in which the politics, morals, society and letters of the time were criticized with the utmost freedom and pungency, and his own personality was brought immediately and familiarly before his contemporaries. The years that intervened between his death and the beginning of the Ciceronian age are singularly barren in works of original value. But in one direction there was some novelty. The tragic writers had occasionally taken their subjects from Roman life (fabulae praetextae), and in comedy we find the corresponding togate of Lucius Afranius and others, in which comedy, while assuming a Roman dress, did not assume the virtue of a Roman matron.

The general results of the last fifty years of the first period (130 to 80) may be thus summed up. In poetry we have the satires of Lucilius, the tragedies of Accius and a few successors among the Roman aristocracy, who thus exemplified the affinity of the Roman stage to Roman oratory; various annalistic poems intended to serve as continuations of the great poem of Ennius; minor poems of an epigrammatic and erotic character, unimportant anticipations of the Alexandrian tendency operative in the following period; works of criticism in trochaic tetrameters by Porcius Licinus and others, forming part of the critical and grammatical movement which almost from the first accompanied the creative movement in Latin literature, and which may be
was regarded as rude precursors of the didactic epistles that Horace

to philosophy but to the literature of philosophy. Though not a philosopher he is an admirable interpreter of those branches of philosophy which are fitted for practical application, and he presents us with the results of Greek reflection vivified by his own human sympathies and his large experience of men. In giving a model of the style in which human interest can best be imparted to abstract discussions, he used his great oratorial gift and art to persuade the world to accept the most hopeful opinions on human destiny and the principles of conduct most conducive to elevation and integrity of character.
